USEFUL KNOWLEDGE.

A N D

ANDO'CIDES, the son of Leogoras, of a noble Athenian family, was born about B.C. 468. We find him, during the war of the Coreyræans and Corinthians, commanding, jointly with Glaucôn, an Athenian squadron which was sent to aid the Coreyræans (Thucyd. i. 51). After this he appears to have been employed as ambassador on numerous foreign missions. During the Peloponnesian war (about B.C. 415) Andocides was involved in the charge of mutilating the *Hermæ*, (see **ALCIBIADES**.) and, according to Plutarch, he saved himself by accusing his real or imaginary accomplices, and among them his own father, whom however he succeeded in rescuing from capital punishment. But the history of all this transaction is obscure. After this event Andocides went abroad and visited Sicily, Italy, the Peloponnesus, and Thessaly: he also visited Asia Minor and the island of Cyprus, where he became on good terms with the king of Citium, to whom he is accused of delivering up his own cousin, a female, whom he had carried off from Athens. The story rests on doubtful authority; but the king and the Athenian adventurer appear to have quarrelled, and Andocides made his way back to Athens. The Four Hundred at this time (B.C. 411) directed the administration of affairs, and Andocides, who was always in trouble, was accused apparently on frivolous grounds, and thrown into prison. On being released he set out again to Cyprus, and attached himself to Evagoras, king of Salamis. But he quarrelled with this new acquaintance also, and again returning to Athens after the restoration of the popular government, he was once more compelled to quit the place and to retire to Elis. On the overthrow of the Thirty Tyrants by Thrasybulus, (B.C. 403,) Andocides returned to Athens, and recovered all the influence which talents and eloquence naturally gave an unprincipled man in the Athenian democracy. The remainder of his life is obscure. The life of Andocides, attributed to Plutarch, speaks of his being sent to Lacedæmon on the subject of the peace (*τῆς εἰρήνης*), in which affair he conducted himself in such a way as not to venture back to Athens. This peace has been conjectured to be that of Antalcidas, B.C. 387, but at this time Andocides was eighty-one years of age, if the date of his birth is correctly given, and not likely to have been employed on such a mission.

It is unfortunate that the events of this orator's rambling life are not better known. The times during which he lived were full of important occurrences, and a minute account of his life and adventures would have thrown great light on the internal history of Athens and that of other states also. There is little doubt that he was a man of ability, but without any principle.

Four extant orations are attributed to Andocides: *On the Mysteries*; *On his (second) Return to Athens*; *On the Peace with the Lacedæmonians*; and that *Against Alcibiades*. The authenticity of the third and fourth are disputed, that of the third at least, perhaps, with good reason.

The orations of Andocides are found in the collections of the Athenian orators, by H. Stephens (1575), in that by Reiske, and in the later edition of Bekker. They are also in Dobson's collection (1828), with the *Lectiones Andocidææ* of Sluiter, &c. They were translated into French by the

A N D

Abbé Auger, 1792. The oration on the Mysteries was pronounced when Andocides was about seventy years of age, in reply to an accusation brought against him by Callias of violating a law respecting the temple of Ceres at Eleusis. The oration contains, besides the immediate subject of the defence, much information on other parts of the orator's life. It is an admirable specimen of simple and perspicuous language, and equally remarkable for the skill with which the defence is conducted.

ANDORRA, a valley on the southern side of the central Pyrenees, situated between two of the highest mountains, the Maladeta and the Moncal, the former 3898 and the latter 3570 yards above the sea. The extent of this valley is forty miles in length, and twenty-four in breadth; it is bounded on the east and south by the territory of Puigcerdá, by Talarn on the west, and on the north by the Pyrenees and the county of Foix, in France. The rivers Balira, Odino, and Os irrigate its grounds, and flow into the main stream, the Segre, which is a branch of the Ebro. The territory is mountainous, but abundant in pasturage. At Caldes, as its name imports, are abundant thermal springs. Its forests produce a great quantity of timber, which is carried down the rivers Balira and Segre into the Ebro, and thence to Tortosa. The mountains abound in bears, wolves, wild boars, goats, and other species of game. Besides Andorra it contains five other villages; Encampo, Masano, Ordino, San Julian, and Camillo, the latter remarkable for its iron mines. The capital, Andorra, is situated on the river Balira, and contains 2000 inhabitants.

Andorra is an independent republic, and though double in extent, is less known than that of San Marino, in Italy. It is governed by a syndic, who presides in the council of the valley, and by two *Tiguiers*, one appointed by the king of France and the other by the bishop of Urgel. Lewis le Debonnaire gave the sovereignty of this valley to Sisebertus, the first bishop of Urgel, in 819, and from that time it has maintained its independence between France and Spain. Andorra, the chief town, on the Balira, has about 2000 inhabitants. The people of the territory speak a Catalan dialect.

See Miñano; Malte Brun, *Universal Geography*, vol. viii. p. 124. Balbi, *Abrégé de Géographie*, p. 370.

ANDOVER, a borough and parish in the N.W. part of the county of Hants, and on the border of the downs which stretch into Wiltshire. It is on the left bank of the river Anton, (a branch of the Test, or Test, which falls into Southampton water,) and from its situation, gets the name of Andover, (Saxon, *Andeafaran*;) i. e., ferry, or passage over the river Ande. It is 63 or 64 miles W.S.W. from London; 51° 12' 30" N. lat., 1° 28' W. long. from Greenwich.

The three principal streets are well paved, but not lighted; the houses are well built, and the town is well supplied with water. The church is near the north end of it, and is a spacious structure, of very great antiquity, having existed as far back as the time of the Conqueror. At the west end is a fine semicircular, arched doorway, with zigzag mouldings. The living, a vicarage, with the chapelry of Foxcote annexed, is in the patronage of Winchester College. There

are meeting-houses for Baptists, Quakers, Independents, and Methodists; a free grammar school, with a school-house built and kept in repair by the corporation; and an almshouse for six poor men, erected and endowed by John Pollen, Esq., one of the members for the borough in the time of William III. Another almshouse, for six poor women, was built with funds bequeathed by Catherine Hanson, but not endowed. There is also a school-house erected and endowed by John Pollen, Esq., for educating twenty poor children. This establishment is now incorporated with the National School, supported by additional subscriptions, in which 250 children are educated.

The town-hall is a handsome stone building with a Grecian front, supported by arches; the under part is used as a market-house. It was erected within these few years. The corporation is said to be as ancient as the time of John; but the present charter was granted by Queen Elizabeth.

Andover first returned members to Parliament in the time of Edward I.: but the right was lost, or disused, from the first year of Edward II., to the twenty-seventh year of Queen Elizabeth, when they were again sent, and have since been regularly returned. Before the passing of the Reform Bill, the right of election was in the corporation, which was considered to be under the influence of the Earl of Portsmouth. By the Boundary Act connected with the Reform Bill, the tything of Foxcote was added to the Borough, which had previously included the parishes of Andover and Knight's Enham. The population of the whole was, in 1831, 4966.

The chief business of the town consists in malting, and in the manufacture of silk, which has lately superseded that of shalloon, the former staple. A considerable quantity of timber is forwarded from Harewood forest to Portsmouth, by means of the canal from this town, through Stockbridge, to Southampton water. The market is on Saturday; and there are three fairs in the year.

About three miles west of the town, at the village of Weyhill, is held one of the largest fairs in England. This fair begins on the 10th of October, and continues for six days. It is thus described in *'Magna Britannia Liberata'*, a survey of Great Britain, published in 1720. 'This fair is reckoned to be as great an one as any in England, for many commodities, and for sheep, indisputably the biggest, the farmers coming out of the south, north, and east to buy the Dorsetshire ewes here. It is also a great hop and cheese fair, the former being brought out of Sussex and Kent, and the latter out of Wiltshire, Gloucestershire, and Somersetshire.' The above account of the chief articles of trade, will apply with little alteration to the present day. The sale of sheep, though the favourite breed may be different, is still great: more than 140,000 have been sold on the first day. The Farnham hops, the choicest of any grown in England, are chiefly sold here, and a place appropriated to their sale, bears the name of Farnham Row. Many horses, particularly cart colts, are also sold.

During this fair, assemblies are held in the town-hall at Andover.

Near Andover, there are the remains of some Roman encampments, especially one on the summit of Bury Hill, a mile or two south-west of the town; and some beautiful specimens of Roman pavement have been found in the neighbourhood. (Warner's *Hampshire*; *Beauties of England and Wales*.)

ANDOVER, a town in the state of Massachusetts, United States, about twenty miles direct distance N. by W. of Boston, and about two miles from the southern bank of the Merrimack river. It is also watered by the Shawshenn. Andover is divided into three parishes, and has some inconsiderable manufactures. The north parish contains the Franklin Academy, and the south parish the Theological Seminary, and Phillips's Academy. The Theological Seminary opened in 1811; it has four professors and (in 1831) 139 students, with a library of 10,000 volumes. The whole number that has been educated here was (in 1831) 514. This establishment has acquired some celebrity from the impulse it has given to the study of Hebrew in the United States. The population of Andover in 1820, was 3889. (*Encyclop. American.*; *Journal of Education*, Nos. x., xi.)

ANDRE' (ST), or ST. ENDRE', the capital of a lordship in Hungary, in the circle called the Hither Danube, and in the department of Pesth; the number of its inhabitants scarcely exceeds 3000. Their chief support is

derived from the cultivation of the vine. The eastern Christians, who are in number about 1000, have seven churches in the town; which gives an average of scarcely more than 157 persons to each church. This singular circumstance originated in the immigration of the Servians under Leopold I., each sect of whom founded their own place of worship.

ANDRE' (JOHN), appears to have been a native of Lichfield, and to have been born there in 1751. In 1769 he met at Buxton a Miss Honoria S——, and the consequence was an immediate attachment, which became one of remarkable devotedness on his part, and which would seem to have been also returned by the lady. Her friends, however, interfered, and she was induced not only to discontinue her correspondence with André, but some years after to give her hand to another. Meanwhile André had become a clerk in a commercial house in London. But on receiving intelligence of Miss S.'s marriage he determined to quit both his profession and his country, and having procured a commission in the army, he proceeded with his regiment to North America, then the seat of war between Great Britain and her colonies. In this new field of enterprise his talents and accomplishments soon raised him to distinction; and he attained the rank of major, with the appointment of adjutant-general to the North American army. In the summer of 1780 Major André was with the troops which occupied the town of New York under the command of General Sir Henry Clinton, when the infamous Arnold, who had been entrusted by Washington with the important position of West Point on the Hudson, about 60 miles above New York, sent over to the British commander his proposals for delivering that fortress into his hands—a scheme which, if it had succeeded, might not improbably have put an end to the war. On Arnold's overtures being accepted, André was appointed to conduct the negotiation with him. After some correspondence under feigned names, André and Arnold met on the banks of the Hudson on Friday the 22d of September, when everything was arranged for the execution of the plot on the following Monday, and the necessary information in writing was put into André's hands to be delivered to General Clinton. Unfortunately for André, the boatmen who had brought him on shore from the English sloop of war in which he had come up the river, having had their suspicions or fears awakened, refused, although he bore a flag of truce from General Arnold, to convey him back, and he was obliged to determine upon attempting to make his way to New York by land. Arnold, to whom he returned, insisted, in these circumstances, that he should exchange his military uniform for a plain coat; and to this André reluctantly consented. A person of the name of Smith was then sent away with him as his guide, and they set out together; but when they reached the next post, they found themselves obliged, in order to prevent suspicion, to follow the advice of the commanding officer, and to remain there for the night. Next morning they proceeded on their journey, and Smith having conducted his charge till they had come within view of the English lines, left him a little below Pine's Bridge, a village on the Croton. André rode on alone for about four leagues farther, when as he was entering the village of Jarrytown, his horse was suddenly taken hold of by three men, who turned out to belong to the New York militia. With unaccountable imprudence, André assumed that they were of the English party, and instead of producing his passport desired them not to detain him, as he was a British officer. When he found his mistake, he endeavoured to induce them to let him go by the offer of his watch and the most tempting promises; but the men were not to be bribed, and having found the important papers of which he was the bearer concealed in his boots, they immediately conducted him to the nearest station. His first anxiety now was for the safety of Arnold; and he contrived to prevail upon the officer in command, who must have been a person of very little perspicacity, to forward a notice of his capture to that general, by which the traitor obtained the opportunity of escaping with his life. Having secured this point André now stated who he was, on which he was conducted to the presence of General Washington at Tappan or Orange Town. On the 25th, his case was submitted by the American general to the consideration of a board of fourteen general officers, among whom were Rochambeau and Lafayette, who had recently arrived with the troops from France. Before this tribunal, André urged that he had come on shore under the sanction of a passport, or flag of truce, transmitted to him by Arnold,

who was, at the time of granting it, a major-general in the American army, and of course had sufficient authority so to act. But the circumstance of his having been found disguised and bearing a false name was considered as taking from him the benefit of this plea, although he proved that in both these points he had acted in obedience to the commands of Arnold, under whose orders he was while he bore his flag of truce. The decision of the court-martial, though the members do not appear to have been unanimous, as has sometimes been asserted, was that the prisoner ought to be considered as a spy; and he was accordingly sentenced to be executed. Both entreaties and remonstrances were employed in vain by General Clinton to avert his fate; but as retaliation was not taken by the execution of any American prisoner, it may be inferred that it was felt even by the English that his sentence was according to the rules of martial-law. He himself exhibited the most perfect resignation to his fate, and does not after his condemnation appear to have disputed the justice of the decision under which he was to suffer. He only begged that his death might be that of a soldier. He was kept in ignorance of the determination of the court-martial upon this point; but when upon being brought to the fatal spot, on the morning of the 2d of October, he perceived that he was to perish on a gibbet, he exclaimed, 'It is but a momentary pang,' and gave no further expression to his feelings. He died with the respect even of those who had found themselves obliged to execute him. 'André,' said Washington, in a letter to a friend, 'has met his fate, and with that fortitude which was expected from an accomplished man and a gallant officer.' A monument was erected to his memory, at the public expense, in Westminster Abbey.

Whatever the books which are considered the standard authorities upon international law may say in reference to such a case as that of André, there is no good apology for his conduct. To say that he acted under the orders of an officer whom he knew to be playing the part of a traitor, cannot be considered as any exculpation. There would be no security for an army or a government if it were not to be at liberty, when it had them in its power, to punish persons detected in devising such plots as this of Arnold and André, under whatever subterfuge they might attempt to shelter themselves. The having recourse to the use of a flag of truce, in such circumstances, must be regarded as a mere trick. General Clinton and Arnold were the great culprits, of whom the latter only has received his due share of opprobrium.

To his last moment André had cherished the hopeless passion which had driven him from his country and his early pursuits. In a letter written after his capture, which has been printed, he states that when he was stripped of everything, he had concealed the picture of Honoria S—— in his mouth. This lady, although it does not appear that he had been informed of the event, had died of consumption only a few months before.

This unfortunate officer was a person of cultivated mind and elegant accomplishments. He excelled in painting and music, and was also no despicable writer of verse. His humorous poem, entitled the *Cow-chase*, which appeared in three successive portions at New York, in 1780, the last being published on the very day on which its author was taken prisoner, is a production of decided talent. It is in the style of Cowper's *John Gilpin*, which celebrated poem was not written till some years later. For further particulars respecting the subject of this notice, see Miss Seward's *Monody on the Death of Major André*, 4to., London, 1781, from the notes and letters attached to which we have taken most of the facts of his private history; a publication by Joshua Hett Smith, Esq., (the person who acted as his guide on his return to New York,) entitled *An Authentic Narrative of the Causes which led to the Death of Major André*, 8vo., London, 1808; and an elaborate article in the *Encyclopædia Americana*, under the head of 'Arnold, Benedict.'

ANDREA VANNUCHI, called DEL SARTO, from the occupation of his father, a tailor at Florence, was born in that city, in the year 1488. He was initiated in the principles of design by Giovanni Barile, and he studied subsequently in the school of Pietro Cosimo. He learned little more from these masters than the mechanical practice of his art, but in the frescoes of Masaccio and Ghirlandajo, and in the cartoons of Michel Angelo and Leonardo da Vinci he found the principal elements of whatever excellence he

afterwards attained. His powers were first developed in some works executed in conjunction with a friend and fellow-student, called Francesco Bigio, for the churches and convents of Florence; but the great picture of St. John preaching, entirely by his own hand, established his claim to independent reputation, and it was considered that the work which immediately followed, the life of Filippo Benizi, in ten compartments, for the church of the Servi, entitled him to rank with any competitor in his native city. Stimulated by this success, Andrea felt anxious to try his strength with his great contemporaries at Rome, and accordingly made a visit to that city. Vasari relates, that, on seeing the paintings of Raffaele, he felt so humiliated, that he returned immediately to Florence, without staying to investigate the great works which had impressed him with so painful a sense of inferiority. Other authorities affirm that he remained in the imperial city a considerable time, dividing his attention between the study of Michel Angelo, Raffaele, and the Antique; this account is by far the more probable, especially as the first works which he executed after his return to Florence manifest an obvious improvement in style. Among these, the most conspicuous were the Descent of the Holy Ghost, the Birth of the Virgin, and the Last Supper, painted for the monastery of the Salvi. Of the last picture Lanzi relates, that during the siege of Florence, in 1529, the soldiers having got possession of the suburbs, and having demolished the church and part of the monastery, on entering the refectory were struck with such reverence at the sight of the painting, that they remained awhile motionless, and then returned, without committing any further injury.

The increasing reputation of Andrea del Sarto procured him an invitation from Francis I. to visit the court of France, and that monarch expressed a wish to retain him altogether in his service. The political troubles of his own country, which rendered the pursuit of art a precarious and unprofitable employment, induced Andrea to embrace with eagerness the proposal of the French monarch, and he set out for his court, where he was received with the most flattering demonstrations of kindness and respect. His first performance was a portrait of the Dauphin, for which he was paid the sum of 300 gold crowns; he painted also for the king the superb picture of the Charity, which is now in the French museum. A multitude of commissions poured in upon him from the principal nobility, and every circumstance seemed to conspire for his honour and advantage. He was engaged on a picture of St. Jerome for the queen-mother, when in an evil hour he was induced by earnest solicitations, sent by his wife and friends from Florence, to return to that city. He obtained permission from Francis I. to depart, on the assurance that the sole purpose of his journey was to transport his family to France; and the king, being desirous to avail himself of Andrea's taste and judgment in the acquisition of works of art, intrusted him with large sums for the purchase of pictures and statues. Andrea was perhaps, originally, neither profligate nor unprincipled; but his character was impaired by that want of moral firmness, which, beginning in weakness, too often ends in vice. His wife was improvident, and he was surrounded by dissipated acquaintances; and he expended in a round of expensive pleasures, not only the money with which Francis I. had liberally rewarded his services, but that also which the monarch had consigned to him for the purpose of selecting objects for his museum. Of course, he never returned to France. Indigence came upon him, and the remorse with which he was continually tormented from the consciousness of ingratitude towards his royal benefactor, was aggravated, not only by the desertion of his gay friends, but by that of his wife also, who fled from him, leaving him a prey to despondency and distress. His afflictions were terminated by the plague which visited Florence in 1530, and carried him off in his forty-second year.

The genuine productions of Andrea del Sarto are not frequently seen out of Florence, but they abound in the churches, convents, and palaces of that city. His style is so various that it is difficult to say what was the natural bent of his mind. He was not incapable, when the subject demanded it, of impressing his works with an air of stern grandeur, whether in relation to the style of design, or to the effect of *chiar' oscuro*; but his more general characteristics are those of harmony and suavity; his colouring is sometimes most delicately tender. He was so expert in mechanical practice, that a copy made by him of a portrait

of Leo X., by Raffaele, deceived even Giulio Romano, although he had inspected the progress of the original, and had even assisted in the execution of it. One of the most pleasing of Andrea del Sarto's pictures, although by no means an example of his general style, is that of the Holy Family, now in the Louvre at Paris, in which St. Joseph reposes on a sack of corn. The panegyrists of Andrea have asserted that if he had studied longer in Rome, he would probably have rivalled the great works of Raffaele and Michel Angelo; but without conceding such extravagant praise, it is quite enough for his reputation that he established it while those great artists were still practising, and that his name has kept its place amidst all the revolutions of taste, during a lapse of three hundred years.

ANDREASBERG, (Mount of St. Andrew,) the second in importance of the mountain-towns of the Upper-Harz, is situated in the province of Grubenhagen, in the kingdom of Hanover, and crowns an eminence which stands at an elevation of 1936 feet above the level of the sea. The neighbourhood is rich in mines, yielding silver, copper, iron, cobalt, and arsenic; and these, as well as the spinning of yarn, lace-making, and the rearing of cattle, afford profitable employment to its inhabitants, who are above 4000 in number. It has a public school for the middling classes. In 1728 a piece of silver ore, weighing eighty pounds, was found in one of the mines near the town, and presented to the Cabinet of Natural History in Göttingen, from which it was, however, stolen in 1783. Andreasberg lies about fifteen miles north of Goslar. The mountain of this name is the highest point in the Harz at which slate is found.

ANDREEWA, (also called Enderly or Enderi,) is a principality of the Kumükian Tartars, lying along the Kasma, between the river Aksai and the Caspian; about 25 miles west of the last-mentioned sea. It forms at present one of the districts composing the government of Caucasasia in Russia in Asia, and embraces the peninsula and gulf of Aghschenskoi. Its surface presents an intermixture of fertile plains and arid wastes of sand; produces grain, and abounds in mineral waters and springs of naphtha. Andreewa is likewise the name given to its capital, and is the mart to which the Lesghian tribes resort for the purpose of disposing of the produce of their depredations. It is an open town situated on the Aktash, at the foot of Mount Tshumla, and contains upwards of 3000 houses, with a population, which is stated by some writers at 12,000, and by others at 15,000 souls. Andreewa was, not long since, an avowed asylum for all the vagabonds and freebooters in the Caucasian regions, and is to this day a thriving market for the sale of slaves. In this last respect it runs a miserable race of competition with the town of Aksai, on the river of that name and in the same principality. It is the seat of some Mohammedan schools, to which the Circassian Mollahs are sent for education. Though little deserving the name of education, yet the smattering of reading and writing which they here acquire, is sufficient to furnish them, upon their return amongst their fellow-countrymen, with the means of keeping the tenets and prejudices of Mohammedanism alive in their bosoms, and thus maintaining a wall of separation between the native and his heretic fellow-subject of the Greek faith.

ANDREOSSI, Count, was born at Castelnaudary in the province of Languedoc, in March, 1761. His family was of Italian descent. At the age of twenty he was made lieutenant of artillery. In the beginning of the French revolution he shared in the general enthusiasm for the new order of things, and he afterwards served under Bonaparte in the early Italian campaigns, where he distinguished himself at the siege of Mantua, in 1795. He next followed Bonaparte to Egypt, where he took a conspicuous part both in the military and the scientific labours of that celebrated expedition. He was appointed a member of the Institute of Cairo, and wrote several memoirs, *On the Lake Menzaleh, On the Valley of the Natron Lake, On the Waterless River, &c.* When Bonaparte returned secretly to France, Andreossi was one of the few officers who accompanied him, and he ever after proved devoted to the fortunes of his great commander. Andreossi served in the so-called Gallo-Batavian army under Augereau on the banks of the Mayne. After the peace of Amiens he was sent as ambassador to England. When Napoleon assumed the imperial crown, Andreossi was made inspector-general of art, and count of the new empire. He went afterwards to Vienna, and having

quitted his post when the war broke out again between Austria and France in 1809, he was present in the campaign of that year, and was appointed governor of Vienna after the taking of that city. He was next sent as ambassador to the Ottoman Porte, in which important situation he won the general esteem of both Franks and Turks. After the abdication of Napoleon in 1814, Louis XVIII. recalled Andreossi from Constantinople, and sent him at the same time the cross of St. Louis. Andreossi was living in retirement when Napoleon landed from Elba, but he then appeared again on the political stage to assist his old master in his last struggle. He was created a peer during the hundred days. After the battle of Waterloo he withdrew again to private life, and busied himself in revising and publishing several interesting memoirs which he had written during his residence in Turkey. His work on *Constantinople et le Bosphore de Thrace* is deservedly esteemed. His memoir *On the Springs and Conduits by which Constantinople is supplied with Water*, contains much curious information on the art of hydraulics as practised by the Turks. Andreossi had written also in 1810 a *History of the Canal of Languedoc*, in which he claimed for one of his ancestors, François Andreossi, the principal merit in the planning of that great work, which had till then been ascribed to the engineer Riquet. This book was the occasion of much controversy with Riquet's descendants, in which the astronomer, De la Lande, sided with the latter. Count Andreossi died in September, 1828, at Montauban.

ANDREW, kings of Hungary. [See HUNGARY.]

ANDREW, SAINT, one of the apostles, the brother of St. Peter. His father's name was Janus. From the first chapter of St. John's Gospel, he appears to have been one of the followers of John the Baptist, whom he left at the call of Jesus, being the first disciple whom the Saviour is recorded to have received. Andrew introduced Peter to Jesus. According to St. Matthew and St. Mark, Jesus found Peter and Andrew together, following their occupation of fishermen, as he was walking by the sea of Galilee, and called them, when they immediately left their nets and followed him; but this is supposed to have happened some time after the first interview recorded by St. John. That evangelist mentions Andrew as the disciple who intimated the presence of the lad with the few loaves and fishes, when the miracle of feeding the five thousand was performed. Such is nearly all that is stated respecting this apostle in Scripture.

The ecclesiastical historians, however, have professed to give us accounts in considerable detail of the latter part of his life. According to Theodoret, he employed himself for some years in journeying and preaching the faith throughout Greece; but Eusebius, and other writers, speak of Scythia as the province of his missionary labours. The common statement, however, is, that he suffered martyrdom at Patre, now Patras, in Achaia, having been put to death by order of Egrius, the pro-consul of that province. The year in which this event took place is not mentioned; but both in the Greek and in the Latin church the festival commemorative of it is held on the 30th of November. The notion that St. Andrew suffered on a cross of the form of the letter X, appears to be of considerable antiquity; but the oldest writers say that he was nailed to an olive-tree. They used to keep, in the church of St. Victor, at Marseilles, what was affirmed to be the very cross on which he had been suspended; it was enclosed in a silver shrine, and was of the common form, that is, with one limb perpendicular, and the other horizontal.

The Scottish historian, Fordun, delivers a legend respecting the relics of St. Andrew, which several of his countrymen have copied. In the middle of the fourth century, it seems, the bones of the saint, which still remained at Patre, were in the custody of Regulus, an abbot, or, as other accounts style him, a bishop, of the Greek church. In the year 345, the Emperor Constantius II. gave orders that these precious remains should be brought to Constantinople; but on the third night before they were removed, an angel appeared in a vision to Regulus, and ordered him to abstract from the chest in which they were kept the upper bone of one of the arms, three of the fingers of the right hand, and the pan of one of the knees. Some accounts add a tooth to the list of items. Regulus having done as he was commanded, was, some years after, directed by another vision to take his departure, with the relics, from Patre; and, having accordingly set out, he was, after

a long voyage, shipwrecked with his companions in the bay of St. Andrews, in Fifeshire, then forming part of the territory of the Picts. Hungus, the Pictish king, received the strangers with great hospitality; and by their instrumentality, he and his subjects were soon after converted, when a Christian church was erected at the place where the missionaries had been driven on shore, and was dedicated to the apostle, the fragments of whose skeleton they had brought with them. Such is said to have been the origin of the city of St. Andrews, and of the assumption of St. Andrew by the Scotch as their patron saint.

Several of the fathers, but none earlier than the seventh century, cite a book called the *Acts of St. Andrew*, professing to be written by that apostle, but which they condemn as a forgery of the Manicheans, or other heretics. There is still extant a narrative bearing this title, but professing to be written by the priests of the Church of Achaia, and entirely different from the former. It may be found in the sixth volume of Surius's *Vite Sanctorum*, and in other collections indicated by J. A. Fabricius in his *Codex Apocryphus Novi Testamenti*. Mention is also made in a decree of Pope Gelasius II., who flourished in the beginning of the twelfth century, of a Gospel of St. Andrew. His holiness condemns it as spurious; but it does not now exist.

ANDREW, (ST.) [See ISLE OF BOURBON.]

ANDREWS, (ST.) an ancient city of Scotland, on the coast of Fifeshire, and on the small bay of St. Andrews. The direction of the side of the bay on which the city stands is W.N.W. and E.S.E., and St. Andrews is open to the N.E. winds, which prevail greatly in April and May, and bring with them cold, unpleasant vapours, which load the air and check vegetation. The climate is, however, in general healthy, except for persons who are liable to rheumatism, or have weak lungs. Since the establishment of hot baths, the city has been much frequented as a favourite watering quarter.

The town stands on a lofty cliff or rock, and on a sort of peninsula, formed by the bay and the 'burn of Kinness,' or the 'Nether Burn,' a small stream which, skirting the town on the southern and eastern sides, forms, at its mouth, a harbour, guarded by piers, and capable of receiving vessels of 300 tons at spring-tides. On the N.W. of the town, 'the Links,' uneven downs formed by the sea, stretch away for nearly two miles to the mouth of the river Eden, and are used for the game of golf, which is much practised. There are similar downs S.E. of the town. The extremity of the peninsula on which the town stands is occupied by the ruins of the cathedral and by some other interesting remains of antiquity. From this part, the three main streets, North Street, Market Street, and South Street or Shoe-gate, diverge: the first, the principal and most southern of them, South Street, runs nearly east and west. These three streets are intersected at right angles by the Lanes or Wynds. There was once a fourth street, called Swallow Street, running to the north of the others and inhabited chiefly by the merchants, but this has disappeared, and the site of it is occupied by a public walk called the 'Scorers.'

Before the Reformation, St. Andrews was an opulent and commercial city. To its annual fair, which commenced in the month of April, and lasted several weeks, from 200 to 300 vessels from all parts of the commercial world resorted. When the town was in its most flourishing state, in the fifteenth and beginning of the sixteenth centuries, there were in it sixty or seventy bakers, and as many brewers. After the Reformation, it gradually decayed, and moreover suffered in the great civil war: so that Dr. Johnson, who visited it in 1773, thus spoke of it, 'One of its streets is now lost; and in those that remain, there is the silence and solitude of inactive indigence and gloomy depopulation.'

By the exertions of individuals, however, a considerable revival has been effected, and many additional improvements are in progress. The principal street is well built, straight and broad; and in this, as in the other two, the houses, which are of stone, are commonly three stories high; while the lightness of the numerous modern edifices diminishes the sombre appearance resulting from the general antiquity of the buildings.

The parish Church of St. Andrews is in South Street, and is a spacious structure, first erected in 1112, and repaired, or rather rebuilt in 1797. It is 162 feet long, and 63 broad, and will accommodate 2500 persons: on the wall inside, is a monument to the memory of Archbishop

Sharp, erected by his son, exhibiting, in rude sculpture the murder of the unfortunate prelate, and setting forth his praises in a long inscription. There is a spire to the church. The chapel of St. Salvator's college is a handsome edifice with a Gothic front, situated in North Street. Within is the handsome monument of Bishop Kennedy, founder of the college. It is the place of worship for the parish of St. Leonard, which comprises a few districts in the town and neighbourhood; and the ministry of which was for a long period held by the principal of the United College, but this is not the case now. There are three dissenting places of worship, one Episcopal, the others belonging to the Burghers and Independents. The town house, or tolbooth, is in the centre of Market Street; and contains one or two antiquities of local interest, but little else worthy of notice. St. Andrews was made a Royal Burgh in 1140: the magistracy consists of a provost, a dean of guild and four bailies. The town, conjointly with Cupar, Anstruther Easter, Anstruther Wester, Crail, Kilrenny, and Pittenwee, sends one member to parliament. The trade of St. Andrews is small. In 1792, a factory for sewing and tambouring muslin was established, which gave employment to above 100 girls as apprentices; but as this branch of industry is unnoticed in later authorities, it is probably extinct. The manufacture of sail-cloth was established about a year after, and promised to become considerable; but this has also been given up. A great number of golf balls are made. About 4000 annually are used in the town and neighbourhood, and about 9000 are sent to Edinburgh, Glasgow, and other places. Some ten or eleven vessels belong to the port, and are chiefly employed in the coasting trade; and eight or ten boats are engaged in fishing. The population of the parish of St. Andrews, which extends about nine miles in length, was in 1831, 5621. There are five fairs in the year.

The university of St. Andrews consists at present of two colleges; viz. the United College of St. Salvator and St. Leonard (formerly distinct), in which the several branches of general literature and science are taught; and the New College, or St. Mary's, which is appropriated to the study of divinity, or of kindred subjects, and is attended solely by theological students. There is no medical or legal school connected with either college.

This university, the most ancient in Scotland, was founded in the year 1411, by Henry Wardlaw, then Bishop of St. Andrews, who granted a charter with the immunities and powers usually granted to universities, to an association of certain men of learning, who had about a year before commenced a course of public lectures on divinity, the civil and canon laws, logic, and philosophy; and had attracted a considerable concourse of students. The charter of Bishop Wardlaw was confirmed by the pope; and in 1431, further immunities were granted by King James I. of Scotland, and ratified by succeeding sovereigns. The seat of the university at this period was the spot where St. Mary's College now stands, and was called the *Pædagogium*.

St. Salvator's College was founded in 1455, or 1458,* by James Kennedy, nephew of James I., and successor of Wardlaw in the see of St. Andrews, and endowed with sufficient revenues for the maintenance of a principal, six fellows, and six poor scholars. The buildings of this college in North Street, form a quadrangle of 230 feet long by 180 broad, into which quadrangle you enter from the south by a gateway, over which is a steeple 156 feet high, and a clock: to the right of the gateway is the chapel already mentioned. The buildings of this college having gone very much to decay, a grant has been made by government, and a new structure has been erected on the east side of the quadrangle. St. Salvator's College is the seat of the United College.

St. Leonard's College was founded in 1512, by Prior Hepburn, and endowed by him from the revenues of an hospital for pilgrims, from the funds of the parish of St. Leonard's, and from property of his own. The before-mentioned hospital was made the seat of the college.

In 1747, it was found expedient to unite the two colleges. The joint establishment was accordingly transferred to

* A school had been taught on this spot even before the foundation of the university, but it was superseded by that institution.

† Bishop Kennedy seems to have set apart the revenues destined for the college, and to have granted the first charter in 1455; the second charter is dated in 1458. This last is very long, and contains all the statutes of the college.

‡ Authorities vary here:—in Sinclair's *Statistical Account* it is stated, that the parish was probably formed about the time of the erection of the college.

St. Salvators, and the buildings of St. Leonard's were sold, and converted into dwelling-houses.

St. Mary's College was formed out of the original seminary or pedagogy of Bishop Wardlaw, by James Beaton, Archbishop of St. Andrews (for the see had been made archiepiscopal in the time of Bishop Kennedy's successor); and his designs were further carried on by Cardinal Beaton, the archbishop's nephew and successor in the see, and by Archbishop Hamilton, who succeeded the cardinal. The enlargement of the pedagogy by Archbishop Beaton appears to have been begun in 1538. In 1579, the college was remodelled under the direction of the celebrated George Buchanan. The buildings occupy two sides of a quadrangle, on the south side of South Street; and have lately been substantially and tastefully repaired.

The curriculum, or course of study in the arts, extends over four sessions. These studies are pursued at the United College, and the session lasts from the end of October to the beginning of May. St. Mary's College has three professors, viz., of divinity, church history, and oriental languages, besides a principal, who also reads lectures on divinity; and the complete course of a student includes four years, but the session is only of four months. The study of mathematics has always formed a principal branch of instruction at St. Andrews.

In each of the colleges are lodging-rooms for the students, which have been now for some time unoccupied; and there are bursaries or endowments, entitling the holders to a certain income for so many years. Fifty-five belong to the United College, and seventeen to St. Mary's. (*Journ. of Educ.* vol. iv., p. 36.) The students of St. Mary's pay no fees. The emoluments of the professors arise from their salaries, or, at the United College, from these with their fees in addition. The number of students at the university was, in 1826-27, 320. (*Journ. of Educ.*) Those who belong to the United College are required to attend divine service twice in the Sunday at the college chapel; except in the case of Dissenters, who are allowed to attend their own places of worship.

The revenues of the United College are somewhat more than 3000*l.* per annum, including the sums received on account of the bursaries; the disbursements in 1823 (the latest statement given in the report of the commissioners appointed by royal authority, some years ago, to visit the Scotch universities) rather exceeded the income; and there is besides a considerable debt. The revenue of St. Mary's, on the average for seven years before 1826, was rather greater than the expenditure, and amounted to above £1000. The university has little property distinct from that possessed by the colleges individually, except the library, which is entitled to a copy of every work entered at Stationer's Hall, and contained upwards of 40,000 volumes in 1830. The officer of highest dignity is the chancellor, but his office is merely honorary: the rector (who is appointed by the principals, the professors, and by the students of theology, and of moral and natural philosophy) is the acting head. He is appointed annually, and one of the principals, or of the professors, of divinity or church history, must be elected. He is presides of the *senatus academicus*, by which body, consisting of the principal and professors of each college, all the academical degrees are conferred. The flourishing trade once carried on in medical degrees has been given up. A grammar-school, and a school for English writing and arithmetic, are under the patronage of the corporation. Dr. Bell, the founder of the Madras system of education, has given a splendid donation of 45,000*l.*, 3 per cent. stock, for the establishment of a comprehensive seminary of education in this his native city, to be called the Madras College. The buildings for this school, forming a large and handsome edifice on the south side of South Street, some distance west from St. Mary's College, are nearly completed.

The antiquities of St. Andrews are numerous and interesting. Those which are ecclesiastical stand near together just by the harbour. The most ancient is the chapel, (situated about forty yards S.E. of the cathedral,) the foundation of which the legend ascribes to St. Regulus, (commonly called St. Rule,) the traditional founder of the place, but which is probably 1000 years old at least. The story is, that a holy person, the abbot of a monastery at Patras, (Patras,) in Achaia, having been warned in a dream to depart without delay to an island called Albion, situated in the farthest extremity of the Western world, set sail with

seventeen monks and three nuns, carrying with him some of the relics of St. Andrew; and was wrecked in the bay now called St. Andrews, (the shores of which were then covered with wood, and infested with huge wild boars,) and lost all except his companions and the precious relics. He succeeded in converting the King of the Picts, who then governed this part of the country, (near the end of the fourth century;) and the grateful prince erected for the saint the chapel of which the ruins still remain. They consist of the walls of the chapel, inclosing an area of thirty-one and a half feet by twenty-five. The greatest dimension is from east to west. At the west-end is the tower, a square building with a base of twenty feet each way, (measured outside of the walls,) and 105 feet high. There is no trace of the Gothic architecture in these ruins, which are doubtless very antient. Adjoining the west side of the tower was another chapel of which no part remains.

The cathedral of St. Andrews was nearly 160 years in building, (A.D. 1159, or 1161 to 1318,) and was demolished in one day, in June 1559, by a mob excited by a sermon of the celebrated John Knox. The eastern gable with its two towers is, however, still standing; and there remains also one of the towers of the western gable, part of the south wall from the western gable to the south transept, and the west wall of the south transept. The towers are each 100 feet high from the ground to the summit; they rose considerably above the roof of the church. The architecture varies, Saxon and Gothic (or late Norman and early English) being intermixed. The western end was of later erection, and in a much richer and more ornamented style than the other; and exceeded it in width by ten or twelve feet. The length of the cathedral, as nearly as can be measured from the unevenness of the ground, was 350 feet, (Sinclair's *Statistical Account of Scotland*;) or 370 feet, (Grierson, and *Beauties of Scotland*;) and the breadth of the transept from north to south was 160 feet, (Sinclair's *Statistical Account of Scotland*;) or 180 feet, (Grierson.) The stone is by no means of so durable a nature as that with which St. Regulus's chapel is built; and the dilapidation has been further increased by the use of the materials for later erections. The ruined church of St. Leonard's adjoins the college of that name.

An extensive wall about 870 yards in length, twenty-two feet high, and four feet thick, with sixteen round or square turrets at different distances, was erected by Prior Hepburn (the founder of St. Leonard's College) in the beginning of the sixteenth century, to enclose for nearly the whole of their circuit the grounds of the great priory of St. Andrews, which had been erected about A.D. 1120. The enclosure is about eighteen acres, and contains the ruins of the cathedral and St. Rule's chapel, besides the relics of some other buildings belonging to the priory. This wall having been constructed of durable stone is tolerably entire, and has three gates still standing; one, a stately gothic arch, fronts the end of South Street.

There are some relics of two monasteries, one of the Dominicans, founded by Bishop Wishart in 1274, and the other of the Observantines (a species of Franciscans), founded by Bishop Kennedy at least 150 years later. Part of one of these edifices, though it is not decided to which of the orders it belonged, is used for the grammar-school, and stands in South Street, about 200 yards from the west port; it has, however, been entirely modernised. Another fragment of the same convent with an arched roof is, perhaps, the most beautiful specimen of pointed architecture in St. Andrews. The other convent was about 100 yards from the west port of North Street outside of the town. Both were demolished in consequence of Knox's preaching in June, 1559, when the cathedral was destroyed.

On the shore of St. Andrew's Bay, on a ridge or cliff, washed on the N. and E. sides by the sea are the ruins of the castle, which serve as a land-mark to seamen. There are some parts of the walls standing on the N. and E., but others have fallen from the encroachment of the sea, which has here gained considerably on the land, while a little way N.W. of the castle, (on 'the Links,') as we have seen, it has thrown up earthy matter. The keep or donjon at the north-west corner is entire. This castle was built by Bishop Roger about A.D. 1200, and subsequently enlarged. In 1336, it was taken and garrisoned by Edward III. of England; re-taken the following year, and nearly demolished. Bishop Trail repaired it towards the end of the fourteenth century, and it became the episcopal residence. It was

further repaired and beautified, and now works were erected by Cardinal Beaton in 1546; but it was demolished by an act of council in or about 1547, and though it was again partially repaired by Archbishop Hamilton, it never recovered from this overthrow.

In the cliff between the harbour and the castle is a singular cave, consisting of two apartments.

St. Andrews was the scene of several remarkable events, during the progress of the Reformation in Scotland. The fires of persecution were repeatedly kindled, for the town was the ecclesiastical metropolis of the kingdom, and the stronghold of the Catholics. Here in 1527 Patrick Hamilton, the first Protestant martyr in Scotland, was burned; and in 1515, Wishart, one of the most eminent of the Scotch reformers, suffered; Cardinal Beaton, the then archbishop, looking on from a window of the castle. The martyr, with his dying breath, foretold the downfall of his persecutor, and his prophecy was remarkably verified about a year after. Norman Leslie, son of the Earl of Rothes, with fifteen associates, proceeded to the castle, and with great address and resolution cleared it of the cardinal's retinue, and of the workmen employed in the repairs or new erections, amounting altogether to 150 persons, and proceeding to the cardinal's chamber, deliberately murdered him. The conspirators with their friends held out in the castle for several months against the troops of the government aided by a body of French; but were at last obliged to surrender upon terms. It was upon this surrender that the act of council for the demolition of the castle was issued. The murder of Archbishop Sharp, in 1679, took place on Magus Moor, about three miles S.W. of St. Andrews, and within sight of the town.

St. Andrews is thirty nine miles N.N.E. of Edinburgh; and in lat. 56° 19' 33" N., long. 2° 50' W. from Greenwich.

It is said that the name of the district where St. Regulus arrived was Mucross; and the promontory on which the city stands was called Kilrymont till the middle of the ninth century. The navigation of the bay is dangerous. (Grierson's *Delinuations of St. Andrews; Beauties of Scotland*, and Sinclair's *Statistical Account of Scotland*.)

ANDREWS (LANCELOT), an eminent English prelate, was descended from an ancient Suffolk family, and was born in the parish of All-Hallows Barking, London, in 1565. His father, Collier says, was a merchant of good repute;—according to the *Biographia Britannica*, he had spent the most part of his life at sea. Young Andrews was educated first at the Coopers' Free School at Ratcliff, and then at Merchant Taylors' School, from which he was sent to Pembroke Hall, Cambridge, by Archdeacon Watts, on one of the exhibitions founded by the latter in that College. He greatly distinguished himself at the University by his studious habits and extensive acquirements; and also in certain lectures which he read as catechist displayed the first promise of that talent for pulpit oratory for which he was afterwards celebrated. Having taken orders, he soon became known as a preacher. His first patron was the Earl of Huntingdon, who took him with him to the north of England; but he had not been long there before he obtained the notice of Walsingham, the Secretary of State, who gave him first the lease of the parsonage of Alton in Hampshire, and soon after obtained for him the vicarage of St. Giles's Cripplegate, London. To this preferment were afterwards added the dignities of prebendary and canon residentiary of St. Paul's, and prebendary of the collegiate church of Southwell. The mastership of Pembroke Hall, and the appointment of chaplain in ordinary to the queen followed; and so greatly was her majesty delighted with his manner of preaching, that she was not long in giving him a stall in Westminster Abbey, a place which he soon exchanged for the deanery of that church. He held this situation when James I. came to the throne. With that monarch he immediately became a great favourite, and the bishopric of Chichester having become vacant, he was presented to it, and was consecrated on the 3d of November, 1605. The king at the same time made him his lord almoner. In 1609 he was translated to the see of Ely; and was soon after made a privy-councillor both for England and Scotland. When James, in 1617, visited the latter kingdom, Bishop Andrews was one of the persons by whom he was accompanied. In 1618, he was advanced to the bishopric of Winchester, and was at the same time made dean of the chapel royal. These were his last preferments.

He died at Winchester-house, in Southwark, on the 25th of September, 1626, and was buried in the church of St. Saviour's, where a handsome marble monument, bearing a long Latin inscription, was erected over his remains. His tomb was opened, and his coffin discovered, in the course of the recent reparation of the church.

The principal work which Bishop Andrews published during his life was a thick quarto volume, printed in 1609, with the title *Tortura Tori*; being an answer to a treatise in which Cardinal Bellarmine, under the name of Matthew Tortus, had attacked the doctrine laid down by King James in his *Defence of the Rights of Kings*, respecting the authority of Christian princes over persons and causes ecclesiastical. Andrews undertook his performance on the command of his majesty; and was considered to have executed his task with great ability. He is also the author of a *Manual of Private Devotions and Meditations for every Day in the Week*, and a *Manual of Directions for the Visitation of the Sick*. After his death, a volume, containing ninety-six of his sermons, was, by the direction of Charles I., printed under the care of Bishops Laud and Buckeridge; and another volume, consisting of a collection of his tracts and speeches, also appeared in 1629. His work, entitled *The Moral Law Expounded, or Lectures on the Ten Commandments*, was first published in 1642. His *Ἀποστολικά Sacra, or Collection of Posthumous and Orphan Lectures delivered at St. Paul's, and St. Giles's Cripplegate*, appeared in a folio volume, in 1657. Bishop Andrews was, also, one of the authors of the common translation of the Bible. The portions in which he was concerned were the Pentateuch, and the historical books from the Book of Judges to the Books of Kings inclusive.

All the writings of Bishop Andrews display abundant learning; but his eloquence, notwithstanding the delight it appears to have afforded his contemporaries, is but little calculated to please the present age. Overspread as it is with verbal conceits and far-fetched allusions, and exhibiting in this way a perpetual labour of ingenuity, it altogether wants that simplicity and directness of effect which is the soul of good writing. Not that there is not a great deal of excellent sense wrapt up in its tinsel tropes, and other puerile and grotesque decorations; but the whole life and spirit of every thought is most commonly suffocated under a load of dead verbiage. The bishop's style, however, would seem to have wonderfully fascinated every body in his own times. Fuller, who is greatly taken with it, and who affirms that Dr. Andrews was 'an inimitable preacher in his way,' in an anecdote which he tells with the view of showing how difficult or impossible it was for those who attempted to copy him to match their model, unconsciously records a severe and, at the same time, well-deserved condemnation of the manner of writing which he so much admires. 'Pious and pleasant Bishop Felton,' he says, 'his contemporary and colleague, endeavoured in vain in his sermons to assimilate his style, and therefore said merrily of himself, I had almost marred my own natural trot by endeavouring to imitate his artificial amble.'

Bishop Andrews was all his life a hard student, and is stated to have made himself conversant with all the learning of his age. After he had been three years at the university, we are told, it was his custom to come up to London for a month every year; and during that space, which he spent in the house of his father and mother, he always put himself into the hands of a master, and studied some language or branch of science with which he was before unacquainted. Casaubon, Cluverius, Grotius, Vossius, and other eminent scholars of the time, have all highly eulogized his extensive erudition, which was wont, it appears, to overflow in his conversation, as well as in his writings. He was also celebrated for his talent at repartee, of which the following instance is told by the writer of a life of Waller, the poet, prefixed to his works. Waller having one day gone to see James I. at dinner, saw the Bishop of Winchester and Dr. Neale, Bishop of Durham, standing behind the king's chair, and overheard the following conversation: 'His majesty asked the bishops,—My lords, cannot I take my subjects' money when I want it, without all this formality in parliament? The Bishop of Durham readily answered, God forbid, sir, but you should; you are the breath of our nostrils. Whereupon, the king turned, and said to the Bishop of Winchester, Well, my lord, what say you? Sir, replied the bishop, I have no skill to judge of parliamentary cases. The king answered, No put off, my lord; answer

the presently. Then, sir, said he, I think it lawful for you to take my brother Neale's money, for he offers it.

Bishop Andrews, we ought to add, adorned his learning and shining talents by the highest reputation for piety, hospitality, charity, and munificence. One of Milton's early Latin poems is an elegy on the death of this distinguished prelate, in which he is bewailed in a strain of the most impassioned regret and admiration.

ANDRISCUS. [See PHILIPPUS.]

ANDROMACHE, the wife of HECTOR. It is also the title of one of the extant tragedies of Euripides.

ANDROMACHUS, a native of Crete, and physician to the Emperor Nero. He was the inventor of a celebrated compound medicine called Theriacle (*Θηριακή*), the preparation of which he described in a poem which has been preserved in the collection of Galen's works.

ANDROMEDA, a constellation, so called by the Greeks from Andromeda, the mythological daughter of Cepheus and Cassiopeia, who was bound to a rock and thus exposed to a sea-monster, from whom she was delivered by Perseus. This constellation occupies a considerable region of the heavens below Cassiopeia, by which it may be thus found. A line drawn through the brightest star of the five in Cassiopeia, marked β , and the pole star, passes through a star of the first magnitude in the head of Andromeda, marked α , and called Alpherat. A line drawn through ϵ Cassiopeia, at the other corner, and the pole star, passes through Almach in the foot of Andromeda, marked γ , while in the line between the two stars thus found, lies Mirach, marked β , in the girdle of Andromeda. The following list, taken from the *Mem. R. Astron. Soc.* vol. v. shows the references to the different stars of this constellation in different catalogues. The first column contains the letter, by which the star is denoted; the second its number in Flamsteed's catalogue; the third that in the Astronomical Society's catalogue, and the fourth the magnitude of the star.

ANDRONICUS was the advocate of the Jews under the reign of Ptolemæus Philometor in their proceedings against the Samaritans in Egypt, who, by asserting the authority of the temple on Mount Garizim, or Gerision, against the temple at Jerusalem, occasioned a controversy which terminated in bloodshed. The Egyptian Jews (although they had built, about the year 150 B.C., an heretical temple of their own, in the province of Heliopolis) zealously defended the authority of the temple at Jerusalem. After the arguments were exhausted, both parties took up arms, and having found that blows could not decide the matter, they appealed to the King, Ptolemæus Philometor, who appointed a solemn day of judgment. In full court it was agreed, that those who were found in error should be killed for the bloodshed already committed. The Samaritan advocates, Sabbai (Sabbæus) and Theodosius, lost their cause against Andronicus, and were put to death. The arbitrary administration of justice in those times, and the character of Ptolemæus Philometor, render this account not quite incre-

dible. (See Josephus's *Antiquities*, lib. xiii. cap. 7, ed. Aurelius Allobrog., p. 434; and Jost's *Geschichte der Juden*, vol. ii. pp. 308, 309.)

ANDRONICUS COMNENUS, emperor of Constantinople, was grandson of Alexis I. In his youth he distinguished himself in the army under his cousin, the Emperor Manuel, against the Turks and Armonians, but having entered into a treasonable correspondence with the King of Hungary, he was arrested and confined in a tower of the palace, where he remained twelve years. He contrived to escape, and after several romantic adventures arrived at Kiew, in Russia, where he won the favour of the Grand Duke Jeroslaus. Like Alcibiades, Andronicus could assume the manners of every country, and his athletic constitution could support the vicissitudes of all climates; he could pass suddenly from the fatigues and privations of the camp to a life of luxury and debauch. He was a great favourite with the fair sex, and he won the affections of no less than four royal princesses in succession, beginning with Eudocia, the emperor's niece, who for him forsook the palace, and accompanied her lover in his early campaigns. Andronicus, in his exile at Kiew, became instrumental in forming an alliance between the Russian prince and the Emperor Manuel, and thus obtained his pardon from the latter. He led a body of Russian cavalry from the banks of the Borysthenes to the Danube, and assisted the emperor against the Hungarians at the siege of Semlin. After the peace, having returned to Constantinople, he protested against the adoption of Bela, Prince of Hungary, who had married the only daughter of the emperor, as presumptive heir to the throne. Andronicus was himself next in the order of succession. The Emperor Manuel however having married a second wife, Maria, daughter of Raymond of Poitou, Prince of Antioch, had by her a son, who was afterwards Alexis II. Meantime, Andronicus, who held a command in Cilicia, fell in love with Philippa, Maria's sister, who gave herself up to him, as Eudocia had done before. The emperor, although himself dissolute in conduct, reproved this connexion of Andronicus with his own sister-in-law; and Andronicus, being obliged to leave Philippa, undertook, accompanied by a band of adventurers, a pilgrimage to Jerusalem, where he won the favour of Almeric, the Christian king of that country, and one of the successors of Godefroy de Bouillon. Andronicus received from him the principality of Beroet, (Berytus,) on the coast of Syria. There he fell in love with a third princess, Theodora, the young widow of Baldwin III., King of Jerusalem, who was herself of the Comnenian line and a distant relation to Andronicus. She lived openly with him as his concubine, and had two children by him. Andronicus being no longer safe in Palestine from the hostility of the Emperor Manuel, repaired, accompanied by Theodora, to Damascus, where the Sultan Noureddin received him hospitably. From thence he travelled to Bagdad, and other parts of the east, and at last settled among the Turks in Asia Minor, whence he made frequent incursions into the Greek territories. For this he was excommunicated by the church and outlawed by the emperor. The governor of Trebizond having found means to seize Theodora and her two children, and send them to Constantinople, Andronicus, in despair, made his submission to the emperor, and repairing to Constantinople, sued for pardon in the most abject manner. He was banished to Oenoe, a town of Pontus, on the coast of the Euxine, between Cape Heracleum and Cape Jasonium, where he remained till the death of Manuel, in 1180, and the disorders of a disputed succession, induced the patriarch and the principal patricians to recall Andronicus, as the only man who could restore peace to the empire. He arrived in the capital in the midst of acclamations, acknowledged the young Alexis as emperor, but arrested the empress-mother, who had been in some measure the cause of the troubles. Andronicus was associated in the empire as colleague and guardian to Alexis. He then developed his ambitious views. He first caused the empress-mother to be tried on a false charge of treasonable correspondence. She was condemned unheard, and was strangled, and her body thrown into the sea. He next murdered young Alexis himself, and then assumed the undivided authority as emperor in 1183. He married Agnes, Alexis's widow and sister to Philippe Auguste of France, who was still almost a child. 'Andronicus's short reign,' says Gibbon, 'exhibited a singular contrast of vice and virtue: when he listened to his passions, he was the

scourge; when he consulted his reason, the father of his people. In the exercise of private justice he was equitable and rigorous; he repressed venality, and filled the offices with the most deserving candidates. The provinces, so long the objects of oppression or neglect, revived in prosperity and plenty, and millions applauded the distant blessings of his reign, while he was cursed by the witnesses of his daily cruelties. The ancient proverb, that bloodthirsty is the man who returns from banishment to power, was verified again in Andronicus. (*Decline and Fall of the Roman Empire*.) He put to death, or mutilated in a cruel manner, all those who, during his long exile, had traduced him, opposed his views, or insulted his misfortunes, as well as those who were the friends of the murdered empress and of her son. A wretch of the name of Aaron, who had been secretary to the Emperor Manuel, and had his eyes put out on account of treason, suggested to Andronicus not to content himself with blinding those he suspected, but to cut out their tongues also, by means of which they might still have injured him. Many of Andronicus's intended victims escaped to Nicæa and Prusa, where they made a stand, but were overpowered, and those unfortunate towns were treated with the greatest barbarity. At last, so many terrors drove the people of Constantinople to revolt; Isaac Angelus, one of the proscribed and a descendant in the female line from Alexis I., took refuge in the church of St. Sophia. A crowd assembled and proclaimed him emperor. Andronicus was then, with his young wife, in one of the islands of the Propontis; he rushed to Constantinople, but was overpowered, taken prisoner, and dragged to the presence of Isaac Angelus, who, without any form of trial, gave him up to the personal revenge of his enemies. He was insulted and tormented in every possible manner; his teeth, eyes, and hair were torn from him, and lastly, he was hung by the feet between two pillars. In his painful agony he was heard to appeal to heavenly mercy, entreating it 'not to bruise a broken reed.' At last some one ran a sword through his body, and put an end to his sufferings. This dreadful catastrophe happened in September, 1185; Andronicus was then past sixty years of age.

ANDRONICUS CYRRHESTES, an architect who constructed, or, at least, a person whose name is attached to, one of the existing remains of ancient Athens, commonly called the Tower of the Winds; the building takes this name from the figures of the eight winds being cut in relief on the exterior wall of the building, with their names above them on the frieze. (See Spon, ii., p. 135, Amsterdam, 1679.) This monument stands to the north of the Acropolis, and is thus described by Vitruvius:—'Those who have paid most attention to the winds make them eight in number, and particularly Andronicus Cyrrhestes, who built at Athens an octagonal marble tower, and cut on each face the figure of the several winds, each being turned to the quarter from which that wind blows; on the tower he erected a marble column (meta), on which he placed a Triton of bronze, holding out a rod in his right hand; and he so contrived it, that the figure moved round with the wind, and constantly stood opposite to it; the rod, which was above the figure, showed in what direction the wind blew.'

This building was intended for a sun-dial, and it also contained a water-clock, which was supplied with water from the spring under the cave of Pan on the north-west corner of the Acropolis. Colonel Leake is disposed to assign the date of this building to about B.C. 159. (See Leake's *Topog. of Athens*; *British Museum, Elgin Marbles*, vol. i., p. 29.)

ANDRONICUS, LIVIUS. [See LIVIUS.]

ANDRONICUS PALÆOLOGUS, the elder, son of Michael, emperor of Constantinople, was raised by his father as his colleague to the throne in 1273, and after Michael's death in 1282, he reigned forty-six years more. The reign of Andronicus, like that of most Byzantine emperors, was continually disturbed by religious controversies, civil wars, and foreign attacks. In 1301, Othman first invaded the territory of Nicomedia, the passes of Mount Olympus having been left unguarded by the neglect or parsimony of the Byzantine court. A formidable host of Catalans and other adventurers came to Constantinople in 1302, and, with the assistance of the Genoese, they, in the coats of the emperor, defeated the Turks in 1304, thus inducing an obliteration of the Turkish vessel. The success of the operation depended on the

siege of Magnesia, which had a great effect on the Hellenes, and behaved, in short, were done by the Turks themselves. Andronicus, partly by force and partly through bribes, succeeded at last in getting rid of these troublesome allies, at an enormous cost. In 1320, Michael, son of Andronicus, having died, Michael's son, Andronicus, distinguished by the historians by the appellation of 'the younger,' revolted against his grandfather; and after several years of a ruinous war, was crowned as colleague to the old emperor in 1325. Another sedition broke out in 1329, which ended in the abdication of the elder Andronicus, who retired to a convent under the name of the monk Anthony. He died in his cell four years after his abdication, and in the seventy-fourth year of his age. He was a weak and bigoted, though not unlearned, prince. It was during these disastrous wars between the two Andronics that the Ottomans effected almost without resistance the conquest of all Bithynia and advanced within sight of Constantinople, while other Turkish emirs took possession of Lydia and Ionia and the adjacent islands. The ruin of the seven churches of Asia was then consummated. Andronicus, the younger, attempted bravely to stem the torrent, but was defeated and wounded by Orchan, the son of Othman, who took Prusa, Nicæa, and Nicomedia. He was, however, spared the mortification of seeing the Ottomans on the European coast. He died in 1341, in the forty-fifth year of his age, leaving by his wife Jane or Anne of Savoy, a boy, John Palæologus, who was put under the guardianship of John Cantacuzenus. (Gibbon's *Decline and Fall*; the Byzantine historians Gregoras, Pachymer, and Cantacuzenus; and Hammer, *Geschichte des Osmanischen Reiches*.)

ANDRONICUS, RHO'DIUS, or the Rhodian. It appears from Plutarch, Strabo, Galen, Aulus Gellius, Ammonius, Simplicius, and other ancient writers, that there resided at Rome, about a century before the birth of Christ, an eminent Peripatetic of this name, who had previously taught philosophy at Athens. He is said to have first arranged, indexed, and published the works of Aristotle, after they had been brought to Rome in the library of Apellicon of Teos, by Sylla; the manuscripts had been communicated to Andronicus by Tyrannion, the grammarian, who seems to have been originally employed to put them in order. Some of the authorities also refer expressly to the Commentaries of this Andronicus on certain of Aristotle's works. The first work, however, supposed to be by this writer, which was recovered in modern times, was a short treatise, published by David Hoeschelius, in 12mo., at Augsburg, in 1594, under the title of *Andronici Rhodii Peripatetici Philosophi Libellus Itepi Παθών*. In his preface, Hoeschelius referred shortly to the different ancient authors who had mentioned Andronicus. In 1607, Daniel Heinsius published, in a quarto volume, at Leyden, from a MS. which had fallen into his hands, a Greek Commentary, or Paraphrase, on Aristotle's *Nicomachean Ethics*, probably so named from having been originally addressed to his son Nicomachus. Heinsius accompanied the text of his author with a Latin translation; but although in the manuscript the work was attributed to Andronicus, the Rhodian, he did not consider himself warranted to insert that name in the title-page. The inscription on the manuscript, he says in his preface, was evidently by an illiterate hand; and he insinuates that there is no proof that Andronicus, although he arranged and indexed the writings of Aristotle, ever wrote a commentary on any of them. In 1617, however, he published a second edition of the Paraphrase at Leyden, in octavo, in which he entitles it *Andronici Rhodii Ethicorum Nicomacheorum Paraphrasis, &c.* In this edition the former preface is withdrawn, and another is substituted, in which he refers to the other ancient authors, besides Plutarch and Strabo, who have spoken of Andronicus, and expresses his conviction that the work is really by him. He was well acquainted, he says, with the several passages in his newly-added authorities, which tend to render this not improbable, although they had escaped his recollection when he published his former edition. It is most likely that his attention was called to them by having, in the interim, met with the preface by Hoeschelius to the treatise *Itepi Παθών*; especially as we find him now reprinting that treatise at the end of the Commentary. The next edition of the Commentary appeared at Cambridge in 1679. It professes to be an exact reprint from the text of Heinsius, but of which edition is not said, although Heinsius himself, in his

second preface, speaks of his first edition as being full of blunders. This second preface the Cambridge editor suppresses, and prints instead of it the other, which Heinsius had withdrawn. To that he adds another of his own, an inspection of which may possibly explain his curious selection from the two written at different times by his predecessor. It consists chiefly of an elaborate display, at full length, of passages respecting Andronicus from the writers previously indicated by Heinsius and Hoeschelius. All this learning the worthy editor evidently wishes to pass off as his own. Heinsius, accordingly, he gravely tells us, preserves a deep silence respecting his author; and to bar out this assertion he prints, as we have said, the original preface only of that eminent scholar. If Heinsius, however, is defrauded of some glory by this clever management, it must be confessed that he is only foiled at his own weapons, and receives no more than the treatment he had himself practised on Hoeschelius. The facts, we think, are worth recording as another illustration of the common saying, that there are tricks in all trades. It may be added, that in 1809 the curators of the Clarendon press at Oxford produced a fourth edition of the *Paraphrase of Andronicus*, in which with amusing scrupulosity they have followed the previous edition of the sister university in all particulars, the ingenious selection from the prefaces of Heinsius included.

After all, great doubts have been entertained by several critics as to the work being really the production of Andronicus the Rhodian. The different opinions upon the subject may be found in Bayle. Gabriel Naudé conceives Olympiodorus, who lived in the sixth century after Christ, to be the author. Sanmaise (Salmasius) also is decidedly of opinion that it is not the work of the Rhodian peripatetic. Others have even attributed it to an Andronicus Callistus, a native of Thessalonica, who lived in the fifteenth century, and came to Italy after the taking of Constantinople. He gave lessons in Greek in different cities of Italy, Angelo Politian being one of his scholars; after which he came to Paris, and was the first who taught the language in the university there. He died in 1478. There is as much diversity of conjecture about the authorship of the short tract *Ἡπὶ Ἡθῶν*; it is generally believed at any rate not to be by the author of the *Paraphrase*. It is stated in the *Biographie Universelle*, that a manuscript in the Imperial Library of France (now the Bibliothèque du Roi) cited by M. Sainte Croix, in his *États des Historiens d'Alexandre*, p. 521, attributes the *Paraphrase* to a Heliodorus of Prusse, that is, Brusa in Bithynia, we suppose.

An English translation of the *Paraphrase on the Nicomachea* appeared in a quarto volume at London, in 1807, with the following title: *The Paraphrase of an anonymous Greek Writer, hitherto published under the name of Andronicus Rhodius, on the Nicomachean Ethics of Aristotle*, translated from the Greek by William Bridgman, F.L.S.

ANDROS. [See BAHAMAS.]

ANDROS, an island of the Grecian Archipelago, lying off the S.E. end of Eubœa, from which it is distant six miles. It lies in a N.W. and S.E. direction, is twenty-one miles long and eight broad, with a population of about 18,000. The island is very high and mountainous, and the highest summits retain the snow during many months in the year. The town called Andros, or Castro, is on the eastern coast, besides which there are sixty-six villages scattered over the island. The soil is very fertile; and the numerous gardens, which are well laid out, produce excellent lemons, oranges, and pomegranates. Much wine is made, but all consumed by the inhabitants, who are great drinkers. Silk, to the amount of about 3000 pounds on an average, is exported annually. It is the practice to sow wheat and barley together, of which they make their bread, but there is not sufficient grown for the consumption of the island; the deficiency is easily made up from the neighbouring island of Eubœa. On the west shore, there is a port called Gabriel, partially sheltered by small islands from the S.W., but on this side of Andros there are no inhabitants, the coast being so very steep and rocky. The N.W. point, called Point Guardia, is in 37° 57' N. lat., 24° 42' E. long.

ANDROSCOGGIN, or AMARISCOGGIN, a river of North America, which rises in about 45° 12' N. lat., 71° 15' W. long., on the east side of the highlands of New Hampshire and Maine. The Chaudière, which enters the St.

Lawrence opposite Quebec, has its sources near those of the Androscoggin, on the north and west side of the same highlands. The Androscoggin flows by numerous branches for about twenty-five miles south into a number of lakes, the chief and most western of which is Umbagog. The united waters forming a large stream flow from this lake in a western direction, which soon becomes a southern one, for thirty miles, under the name of Amariscoggin. The river having reached the northern base of the nucleus of the White mountains, turns due east, and piercing the mountain-chain flows in this direction for fifty miles. Here it makes another bend at right angles, and runs south for thirty miles, to the latitude of 44°. Below this point, by a curving course of twenty miles south-east, then east, and finally north-east, it joins the Kennebec at Merry-meeting Bay, about six miles above the town of Bath, in the state of Maine. The entire course, measured along the windings, as given by the maps, is not less than 200 miles. Below the mountains, the river is called the Androscoggin; it has no large tributaries, but is increased by numerous rivulets, and, like the other rivers of Maine, is, for its length, a very large one. The tide ascends the Androscoggin to near Durham, about thirty-five miles from the open ocean. Though obstructed by falls and shoals, like the Kennebec, both these rivers afford great facility for inland navigation: the chief article transported down them is timber. (See Darby's *Geographical View of the United States*.)

ANDUJAR, a town of Spain, in Andalusia, 38° N. lat., 4° W. long., 40 miles E.N.E. of Cordova, and 19 N.W. of Jaen, situated on an elevated plain at the foot of Sierra Morena. The river Guadalquivir embraces it on the east and south. The confined situation of Andujar renders it very sultry in summer, and subjects the inhabitants to bilious and putrid inflammatory fevers. The soil is very fertile, and produces wheat, barley, oil, wine, honey, and silkworms. The wines of Andujar are of a sharp taste, from their containing a large portion of tartar, but are rendered palatable by a particular process called by the Spaniards *arropar*, or sweetening. At Andujar the coolers, called *alcarrazas*, are manufactured of clay. The inhabitants are principally employed in agriculture, but there are also at Andujar some tanneries, and manufactories of soap and earthenware. There is a very ancient bridge of fifteen arches over the Guadalquivir, which is in a very bad state of repair. In January, 1823, the river overflowed, and damaged one of the piers; in consequence of which, two of the arches fell down. The general post and coach-offices for all Andalusia are at this town.

The population of Andujar amounts to 13,662 souls within the city, but a greater number of persons live in the numerous *cortijos*, farms, of the neighbourhood. Andujar contains five parish churches, six convents of monks, four of nuns, one hospital, one school, and two alms-houses, one for twelve old men and another for the same number of aged females. (See Miñano; Ponz, *carta* v., n. 6—26, tom. xvi.)

ANDUZE, a town in France in the department of Gard. The town itself is ill built, but it is in a pleasant country, on the right or S.W. bank of one of the streams called Gardon, and which is distinguished as the 'Gardon d'Anduze.' The inhabitants, who amount to more than 6000, are mostly protestants, and are engaged in the manufacture of hats, cloth, serge, silk stockings, pottery, and glue, which find a sale at the great fair of Beaucaire, in the same department. [See BEAUCAIRE.] It is about 22 miles N.W. of Nismes, the departmental capital.

ANEGADA, or the DROWNED ISLAND, one of the lesser Antilles, and the most northern of the group known as the Virgin Islands. The surface of Anegada is the production of lithophytes, based on a submarine foundation. The island is for the most part a dead level. On the south-east, there is a gradual rising of the ground from north to south to the elevation of sixty feet, and this is the highest point of the island. The south side is a continued mass of shelves, loosely covered with vegetable mould, mixed with sand. This mould is the result of sea-weed, which has lost its saline properties through exposure to the sun; it is light, and of a dark brown colour, and in many places covers the ground only to the depth of a few inches. When the shelves are intersected by openings, as at 'Philippe Auguste' and of various widths, larger than a child. 'Andronicus' been detained, and soon, 'exhibited a singular contrast of mould has been, when he listened to his passions, he was the

healthy and vigorous appearance. The few trees found on the island grow in these situations. The northern, western, and eastern sides of the island are less favoured, being covered with sandy deposits thrown forward by the surf. The sand is frequently formed into hillocks forty feet high, and where they do not occur, detached masses of limestone and coral may be seen, many of which are upwards of thirty feet high. Behind these rocky hillocks some patches of productive soil are found, and these are cultivated as garden-ground by the inhabitants. Several ponds are met with on the surface of the island, from some of which considerable quantities of salt are gathered.

There is abundance of fresh-water on almost every part of the island, even in the immediate vicinity of the sea and of the salt-ponds. The water, by filtering through the surface soil, is very speedily deprived of its saline particles.

The vegetable productions of Anegada are not numerous, but it is singular that several of them are not observed in any of the other Virgin Islands. It appears probable that the seeds of these must have been carried there by currents, or conveyed by birds from the Spanish main.

Anegada is chiefly noted for the numerous wrecks which have happened on the reef by which its windward or eastern side is bordered, and which continues, under the name of the Horseshoe, about four leagues to the south-east, terminating seven miles from the east end of Virgin Gorda. The chief profit of the inhabitants comes from these shipwrecks; and, except on such occasions, the only labours in which they engage are those of raising provisions for their subsistence, and cultivating some small patches of cotton, the produce of which is taken for sale to the neighbouring island of Tortola.

The length of the island, in a direction east-south-east, is ten miles, and its greatest breadth four miles and a quarter. The south-east point of the island is in $18^{\circ} 44'$ N. lat., and $61^{\circ} 16'$ W. long. The population consists of eleven white and twenty-one coloured and black families. (See Purdy's *Colombian Navigator*, and *Journal of the Royal Geographical Society*, vol. ii.)

ANEMOMETER, from the Greek language, signifying *wind-measurer*, is an instrument for measuring the force of the wind, by finding what mechanical effect the wind to be measured will produce upon the apparatus. The first anemometer was invented by Wolf, and is described by him in his *Elementa Matheseos*, vol. ii. p. 319 (Geneva edition, 1716). It consists of four sails, similar to those of a windmill, but smaller, turning on an axis. On the axis is a perpetual screw, which turns a vertical cog-wheel round a second axis, placed transversely to the former. To the second axis is attached a bar, on which a weight is fixed, so that the sails cannot turn without moving round the bar in a vertical circle. When the wind acts upon the sails the bar rises, and this continues until the increased leverage of the weight furnishes a counterpoise to the moving force of the wind. The number of degrees through which the bar is moved to produce this effect is measured on a dial, the hand of which turns on the axis of the cog-wheel.

The principle of Dr. Lind's anemometer is as follows:—

the wind on B. This difference can be ascertained by the graduated scale. Hence, when the area of the bore at B is known, and the height of b C observed, the column of water is found the weight of which is equivalent to the force of the wind. The velocity may thence be found by observing (see **AERODYNAMICS**) that the velocities are nearly as the square roots of the resistances, and that the moving force of a wind of 20 feet per second on a square foot is 12 ounces.

See the following table, calculated by Dr. Hutton, who gives the coats of the veta with Dr. Lind's anemometer, at to close contact by the ligature; *Mathematical Dictionary*, ether, thus inducing an obliteration of, and indicates what vessel. The success of the operation depends on differences between

Difference of Levels in inches.	Force of Wind in pounds.	Velocity per hour in miles.

9	46.9	108.0
10	52.1	113.6
11	57.3	119.2
12	62.5	124.0

In Regnier's anemometer, a bar, carrying a flat wooden surface at right angles to it, protrudes from a box, through a hole in the front of which it slides. This bar is met by a spring, which resists its further entry, until force is applied against the wooden surface. In the interior of the box, the under side of the bar carries rackwork, which plays on a cog wheel, the axis of which, passing through a side of the box, carries a hand round a dial-plate. The flat surface of wood is presented to the wind, which presses upon it and forces back the bar, carrying the cog wheel and hand through an angle, greater or less, according to the greater or less impulse of the wind.

Various other contrivances have been proposed; but those which we have described contain their main principles. For a table of the force of winds, see **AERODYNAMICS**.

ANEMONE is a genus of the natural order *Ranunculaceae*, in which are comprehended many beautiful flowers. It consists of lowly herbs, usually perennials, with white or purple, or scarlet, or even yellow blossoms, in which there is no distinct calyx, and which are succeeded by a cluster of grains, each terminated by a long silky feathery tail. As the species generally grow on open plains or in high exposed situations, their feathery grains produce a singular shining appearance when waved by the breeze, whence has been derived their name (from the Greek *ἀνέμων*), which literally signifies Wind-flower, the appellation actually bestowed by the English.

All the anemones possess, in common with other *Ranunculaceae*, the property of extreme acridity. The leaves of *A. pulsatilla* will raise blisters on the skin; if chewed, they produce irritation of the throat and tongue; and their roots, as well as those of *A. pratensis*, nearly related species, produce nausea and vomiting if administered in very small doses, on which account they have been strongly recommended by some medical men, in various complaints. The bruised leaves and flowers of *A. nemorosa* have been found to cure the tinea in the head of children. The following are the most remarkable species:—

1. *A. pulsatilla* or pasque flower; this grows wild upon exposed downs in various parts of England, as on the Gogmagog Hills near Cambridge, the heath at Newmarket, &c. It has large purple flowers and finely cut hairy leaves; and is very nearly the same as the *A. pratensis*, the use of which, in diseases of the eye, has been so strongly recommended by Baron Stoeck and others.

2. *A. nemorosa*, the wood anemone; found abundantly in woods all over England, covering the ground with its neat white flowers under the shelter of bushes as early as March and April. It is a perennial plant with knobby roots, and a short stem having one or two smooth, bright green, deeply cut leaves. It is poisonous to cattle.

3. *A. pavonina*, the Peacock anemone; a native of the vineyards in Provence, about Nice, and in other parts of the south of Europe. This is not very uncommon in gardens, where it is usually, but improperly, named *A. stellata*. It is known by its scarlet or scarlet and white flowers, which are usually double, and have their divisions very sharp-pointed. In habit it is like *A. coronaria*, for a variety of which it is often mistaken. It is one of the handsomest of the cultivated species.

4. *A. coronaria*, the common garden anemone. Found in a wild state in moist meadows in the south of France, Italy, and Greece, and different parts of Asia Minor; Dr. Russell speaks of it as abundant near Aleppo. In these places it is seen only in a single state, but even then sporting into a

variety of colours, the principal of which are white, scarlet, and purple in different shades. In the gardens it is too well known to require description: the single varieties are usually called *poppy anemones*: the double kinds owe their peculiar state either to a multiplication of the petals, or to a conversion of the stamens and pistilla into petals; these have been procured by patient cultivation for some hundred years, and are still improving. The method pursued has been to save seeds only from the kinds that have the greatest vigour, or the greatest tendency to a multiplication of their parts, and wherever a double flower is accidentally capable of producing seed, to prefer it to all others. By this means habits that were originally accidental become fixed, and capable of being further acted upon by the persevering gardener. A course of this sort patiently followed up, has enabled the Dutch to improve the race of anemones so much as to obtain them within a few years with stems nearly half a yard high, and with blossoms six inches across.

5. *A. stellata*; a native of various parts of Germany, France, and the Levant, is also often seen in our gardens, where it is called *A. hortensis*. It differs from the last in having smaller and narrower petals, very rarely double flowers, a greater tendency to purple in their colours, and much broader leaves. It is not so liable to vary as the last species.

Gardening books are filled with directions for the management of these plants; all of which, in this as in most other cases, may be reduced to a few simple rules, resulting, indeed, from experience, but which might have been just as well deduced from the consideration of the natural habits of the species. 1. They grow wild in rich and moist pastures, the soil for them should therefore be fresh loam, with as great a proportion of stimulating manure as they can be made to bear. 2. They are natives of the hottest parts of Europe, where the winter's cold is not more than the olive will bear; they should therefore never be exposed to the severest frosts of England, but should be protected by a covering of some kind, either in the shape of frames or a mulching of decayed tan. It is true that they are hardy enough to exist and flower without this care, but the beauty of plants protected is infinitely greater than that of such as are left ex-

posed in the open border. 3. They commence their growth during the mild winters of their native countries, and are ready as soon as the spring is sufficiently advanced to start up into flower. As the summer advances, and the heat and drought increase, they perfect their seeds and lose their leaves, when they fall into a state of rest; summer and autumn are, therefore, their real winter, and, consequently, it is at this time they should be taken up and prepared for the succeeding season. 4. When they are in a growing state in their native countries, the sun's rays have but little force, and they are consequently not prepared to bear much exposure; for this reason, florists find it necessary to shade them, when they flower during the hot weather of our English summers.

Like all other rules in gardening, the above directions may be modified and departed from without any great evil; but if the object is to cultivate this class of flowers in the greatest perfection, and to improve their race, these rules will be found too important to be materially neglected.

For *A. Hepatica*, see *HEPATICA*.

ANEMOSCOPE, an instrument for determining the direction of the wind; usually constructed by connecting with the spindle of a weathercock the hand of a dial on which the points of the compass are marked.

ANETHUM. [See *FENICULUM* and *PIMPINELLA*.]

A'NEURISM, is a Greek word (*ἀνευρισμός*), literally signifying, 'a widening, or extension': it is now used to signify a tumour, consisting of a preternatural enlargement of an artery. The artery is the only seat of this disease; and any artery of the body may be the subject of it, but it is much more common in some arteries than in others. The corresponding disease in a vein is termed *VARIX*.

An **ARTERY** is composed of three membranes which are firmly united, and form the walls of a strong, elastic, and extensible tube. These membranes are called *tunics* or *coats*. In the healthy state of the artery these tunics yield only to a certain extent to the impulse of the blood, so that the tube possesses only a certain diameter; but in a state of disease the impulse of the blood distends these tunics to a preternatural extent, causing that part of the artery which is diseased to swell out into a tumour or bag. The distension of the coats of the artery progressively increasing, they are at last capable of no farther stretch-

ing, and consequently are torn asunder and burst. But the inner and middle coats of the artery are not as extensible as the external coat; the two former coats are therefore ruptured a considerable time before the latter gives way, in which case the only proper coat of the artery forming the wall of the aneurismal tumour is the external. This coat in its turn getting progressively thinner and thinner as the dilatation goes on, at length bursts like the former: the blood escapes, and life is suddenly extinguished. But sometimes the tumour does not burst even after the rupture of the external coat of the artery; for there is placed around the artery a dense and strong membranous sheath consisting of what is termed cellular membrane, which sheath is far more extensible than any of the coats of the artery, and it is found that sometimes the aneurismal sac or the bag-like tumour which the dilated artery forms, consists only of this condensed cellular membrane, all the proper coats of the artery having been rent and destroyed by the progressively distending force. Thus an aneurism may consist simply of the dilatation of the coats of an artery without the rupture of any; or of the dilatation of some with the rupture of others; or of the rupture of all, the bag of the tumour being formed solely by the cellular sheath of the artery.

When the coats of the artery have burst and this portion of the tube is dilated into a sac, it is evident that this sac is beyond the direct current of the circulation, and that the larger the bag, the farther its contents will be from the influence of the direct current of the blood. The consequence is, that the blood contained in the aneurismal sac undergoes a peculiar change, a modification of the process of coagulation [see *BLOOD*]; the thinner part of the blood being removed, while a portion of the thicker part, or the fibrin, remains. In this manner there is left upon the internal surface of the sac a stratum of the thicker or fibrous part of the blood. Successive depositions are made of this fibrous part of the blood by which the cavity of the tumour is gradually diminished. At length the sac becomes entirely filled with this substance, which forms for it a firm plug. The deposition of this fibrin is not confined to the aneurismal sac, but is continued into the artery itself, both above and below its dilatation, until it reaches the next important ramification which is given off from the artery, where it stops. In this manner the circulation through the aneurismal portion of the vessel is prevented; the blood is determined into other channels; this portion of the vessel, being no longer of any service in carrying on the circulation, is blocked up, and in this manner is effected a spontaneous cure of the disease.

But this beautiful curative process, though it occasionally happens, is not the usual course. When the external coat or the cellular sheath of the artery are stretched beyond a certain point, it would seem that its vitality is diminished; at length a part of it mortifies or dies: an eschar is formed; the eschar sloughs away; an opening is thus formed in the tumour; the blood rushes out, and the patient dies. This is the mode in which the aneurismal sac bursts when the aneurism is situated on the external part of the body. But if the aneurism be internal the process is different. The tumour becoming thinner and thinner by successive distention, bursts suddenly by a crack or fissure, through which the blood is discharged.

The first symptom which denotes the formation of an aneurism, is the perception of an unusual throbbing in the diseased artery. If the situation of the artery be such that it can be seen or felt, a small tumour is manifest. This tumour, when carefully observed, is found to have a pulsatory motion, the pulsatory motion, as well as the tumor itself, disappearing when the part is compressed, but instantly reappearing on the removal of the pressure. Commonly, the tumour is without pain, and without any discoloration of the skin. The magnitude of the tumour, whatever its size when first discovered, is steadily progressive; in proportion as it grows larger the pulsatory motion diminishes, and when it has attained a very considerable size the pulsation is no longer perceptible. The tumour continually enlarging, produces a variety of effects on the parts with which it comes in contact. Some it pushes aside, others it carries with it, and others it destroys. The adjacent muscles, for example, whether they are situated directly over the aneurism, or are at one side of it, are used by Philippe Auguste as dwindled, and sometimes 'almost to a child.' Andronicus's tiguous parts. The soon, 'exhibited a singular contrast of of their natural When he listened to his passions, he was the

the sac, as they often do, they are necessarily stretched as the tumor enlarges, and this distension of the nervous cords sometimes occasions intense pain. The cartilages and bones, pressed upon by the advancing tumor, gradually disappear, and at length are so completely destroyed that not the slightest vestige of them remains. In general, as long as the tumor is small, it is unattended with pain, but the changes which it produces in other parts, such as the stretching of the nerves and the absorption of the bones, is sometimes attended with intolerable pain, capable of being mitigated by no means hitherto discovered. Death at last puts an end to the pain and the patient together: the approach of the fatal event being clearly indicated by the increasing thinness, softness, and darkness of the tumor.

The importance in practice of discriminating between this most dangerous disease and all other tumors is manifest; but the distinction is not always easy, or at any rate is not always made. Many a fatal accident has happened in consequence of incisions having been made into aneurisms which were mistaken for abscesses. Vesalius was consulted about a tumor of the back, which he pronounced to be an aneurism: soon afterwards an imprudent practitioner made an opening in the swelling and the patient bled to death. Ruyseh relates that a friend of his opened a tumor near the heel, not suspecting it to be an aneurism, and the hæmorrhage, though suppressed at last, placed the life of the patient in the utmost jeopardy. A person consulted Boerhaave about a swelling at his knee, who cautioned him against allowing it to be opened: it was opened, and the man died on the spot. Even Ferrand, head surgeon of the Hôtel Dieu, mistook an axillary aneurism for an abscess, plunged his bistoury into the swelling and killed the patient. The characters by which the aneurismal swelling may be distinguished from all other diseases are given at great length in surgical books.

There is something in the structure of the larger arteries which predisposes to this disease. Their coats are thinner in relation to the magnitude of the column of blood with which they are filled than the coats of the smaller arteries. The internal are much more subject to aneurism than the external arteries. The curvatures of the arteries are another predisposing cause. The period of life at which aneurism is most frequent is between the ages of thirty and fifty. Sir Astley Cooper, however, states that he has seen the disease in a child only eleven years old, and that he has operated for it with success in a man of eighty-five. It is much more common among males than females. Out of 63 cases of this disease, 56 were males, and only 7 females. Aneurism so often follows a sudden violent shock sustained either by the whole body or by a limb, and more especially by the sudden violent extension of a limb, as apparently to justify the common opinion that external violence is among the most frequent exciting causes of the malady.

Excepting in the exceedingly rare case in which the spontaneous cure, already explained, is effected, this disease, when left to itself, uniformly proves fatal by the ultimate rupture of the tumor, in consequence of which the patient expires either instantaneously from the great and sudden loss of blood, or by degrees from repeated losses of it. And yet anterior to the time of Galen, who lived about the middle of the second century, there is to be found no record whatever of this terrible malady. The older practitioners, indeed, who believed that the arteries were air-tubes, could have had no conception of the existence of an aneurism. It has been justly observed, that were the number of individuals in Europe who are now annually cured of aneurism by the interference of art, to be assumed as the basis of a calculation of the number of persons who must have perished by this disease, from the beginning of the world to the time of Galen, it would help to convey some conception of the extent to which anatomical knowledge is the means of saving human life.

The cure of aneurism consists in the obliteration of the preternatural cavity of the artery. The obliteration of this cavity is the sole object of the operation, which is found to be the only sure and effectual mode of curing the disease. This operation consists in cutting down upon the artery and passing a ligature around it above its dilatation. The immediate effect of the ligature of course is to stop the flow of blood into the sac; its ultimate effect is to excite inflammation in the coats of the vessel, by which its sides, brought into close contact by the ligature, permanently adhere together, thus inducing an obliteration of the cavity of the vessel. The success of the operation depends entirely on

the completeness of the adhesion of the sides of the vessel, and the consequent obliteration of its cavity. But this adhesion will not take place unless the portion of the artery to which the ligature is applied be in a sound state. If it be diseased, as it almost always is, near the seat of the aneurism, when the process is completed by which the ligature is removed [see INFLAMMATION], hæmorrhage takes place, and the patient dies just as if the aneurism had been left to itself. For a long time, surgeons were in the habit of applying the ligature as close as possible to the seat of the aneurism: they laid open the aneurismal sac in its whole extent, and scooped out the blood contained in it. The consequence was that a large deep-seated sore, consisting of parts in an unhealthy state, was formed; and it was necessary to the cure that this sore should suppurate, granulate, and heal,—a process which the constitution was frequently unable to support. Moreover, there was a constant danger that the patient would perish from hæmorrhage, through the want of adhesion of the sides of the artery. The profound knowledge of healthy and of diseased structure, and of the laws of the animal economy by which both are regulated, which John Hunter had acquired from anatomy, suggested to this eminent man a mode of operating, the effect of which, in preserving human life, has placed him high in the rank of the benefactors of his race. This consummate anatomist saw that the reason why death so often followed the common operation, was because a process essential to its success was prevented by the diseased condition of the artery. He observed that while the vessel close to the aneurism was always diseased, at some distance from the aneurism it was in a sound state: it occurred to him, that if the ligature were applied to this distant part, that is, to a sound instead of a diseased portion of the artery, the process necessary to the success of the operation would not be counteracted. But to this there was one capital objection, namely, that it would often be necessary to apply the ligature around the main trunk of an artery, before it gives off its branches, in consequence of which the parts below the ligature would be deprived of their supply of blood, and must therefore mortify. He was well acquainted, however, with that arrangement of the blood vessels which has been explained under the term ANASTOMOSIS. Reflecting on the number and freedom of the communications of the arterial tubes, he conceived it possible that a limb might receive a sufficient supply of blood to maintain its vitality through the medium of its collateral branches only. For an aneurism in the ham, he, therefore, boldly cut down upon the main trunk of the artery which supplies the lower extremity, and applied a ligature around it, where it is seated near the middle of the thigh, in the confident expectation that, though he thus deprived the limb of the supply of blood which it received through its direct channel, it would not perish. His knowledge of the processes of the animal economy led him to expect that the force of the circulation being thus taken off from the aneurismal sac, the progress of the disease would be stopped; that the sac itself, with all its contents, would be absorbed; that by this means the whole tumor would be spontaneously removed, and that an opening into it would be unnecessary. The most complete success followed this noble experiment; and the sensations which this philosopher experienced on witnessing the event constituted an appropriate reward for the application of profound knowledge to the mitigation of human suffering. After Hunter followed Abernethy, who, treading in the footsteps of his master, for an aneurism of the femoral, placed a ligature around the external iliac artery; lately the internal iliac itself has been taken up, and surgeons have tied arteries of such importance, that they have been themselves astonished at the extent of their success. Every individual on whom an operation of this kind has been successfully performed is snatched by it from certain and inevitable death. (See Cooper's *Surgery*; Hodgson on the *Diseases of Arteries and Veins*; Bell's *Surgery*; Abernethy's *Surgical Works*; *Use of the Dead to the Living*, &c., &c.)

ANGEL (COIN.) Dr. Johnson defines it as 'a piece of money anciently coined and impressed with an angel, in memory of an observation of Pope Gregory, that the pagan Angli, or English, were so beautiful, that, if they were Christians, they would be Angeli, or Angels.' But we must remark, that Pope Gregory's observation was made in the seventh century; and the coin called the angel was not struck in England till the middle of the

fifteenth century. The angel was originally a gold coin of France, where it was first coined, at least by that name, in 1340. (Seq. Ducange, v. Moneta, and Le Blanc, *Traité Hist. des Monnoyes de France*, 4to. Amst. 1692, p. 207.) In France, where it was soon followed by the half and quarter angel, it was always of fine gold, but not always of the same weight. It appears to have been introduced with its minor divisions, into England, by Edward IV., in 1465, (see Leake, pp. 150—161,) and was continued as a coin by King Henry VI. when he returned to the throne. Angels and half-angels are the only gold coins known of Richard III. (Leake, p. 170.) When first introduced, the angel was rated in value at 6s. 8d., and being of the same value as the noble, was sometimes called the noble angel. This value was continued at Henry VIII.'s first coinage of gold. In the coinage of that king's latter time, the value was raised to 8s., and so continued through the reign of Edward VI. Queen Mary's angel went for 10s., which value continued to the end of the reign of Charles I., the last of our kings who coined the angel. So base was Henry VIII.'s gold coinage of this money, that Stow, in his *History of London*, says, 'I have seen twenty-one shillings given for an old angel to gild withal.' Queen Elizabeth, (according to Nicolson's *Historical Library*, p. 267, from Fynes Moryson's *Itin.* Part i. li. 3 c. 6.) in the 13rd year of her reign, (1600-1601) contracted not only for the coining of angels, and their usual divisions, but for pieces of an *angel and a half* and *three angels*, of the finest angel gold; but it is presumed that the contract for these larger pieces was never completed, as no such coins have been seen by our collectors. The usual device upon the obverse of the angel, was the figure of St. Michael standing upon the dragon, and piercing him through the mouth with a spear, the upper end of which terminated in a cross, or cross crosslet. The reverse of the earlier ones had a ship, with a large cross for a mast, with the royal arms in front. The angels of James I. and Charles I. have the mast of the ship with a main-top, and no cross. The obverse had the king's titles surrounding the device. The reverse, from Edward IV. to Edward VI., bore the inscription 'PER CRUCEM TVAM SALVA NOS CHRISTE REDemptor.' The reverses of the angels of Philip and Mary, Elizabeth, and James I., bore, partly at length, and partly abridged, the sentence, 'A DOMINO FACTUM EST ISTUD ET EST MIRABILE [IN OCULIS NOSTRIS.]' Charles I.'s angel had on the reverse, AMOR POPVLI PRÆSIDIVM REGIS. Folkes (pl. xiii. of his *Gold Coins*) has engraved a piece in silver, struck from the reverse only of a die, intended for an angel by King Charles II., but never coined; with the same inscription on the reverse as his father's angel. The only distinction by which the angels of Henry VI. are known from those of Henry VII. is, that in the former, the archangel Michael stands with his left foot upon the dragon; in the latter, the angel stands with both feet upon the dragon. In the collection of Lord Pembroke there is a six-angel piece; but it is not certain that it was intended for a coin. The Angelets of Edward IV., and to Henry VIII., have on the reverse, O CRUX AVE SPES UNICA. The angelets of Edward VI. have the same inscription on the reverse as the angel.

ANGELICA, a genus of plants belonging to the natural order *umbelliferae*; it comprehends several species, the principal part of which are to be met with in botanic gardens, and one that was formerly very much cultivated as an esculent plant, on account of which we admit the genus here. This, the *Angelica archangelica*, or *Archangelica officinalis*, as it is now sometimes called, is a native of the banks of rivers and of wet ditches in all the northern parts of Europe; in this country it grows abundantly on the banks of the Thames below Woolwich, and in several other places. It is a biennial plant, with a large fleshy aromatic root, blackish externally, but white within; and a stout furrowed branched stem as high as a man. Its leaves are of a clear bright green, shining, and divided into a very large number of heart-shaped finely serrated lobes. The flowers are white, and disposed in round, very compact umbels; they are succeeded by large broad-winged grains of a pale yellowish-brown colour. Each partial umbel is surrounded at its base by seven or eight pointed undivided bractæ.

For the sake of its agreeable aromatic odour, this plant has been much cultivated, and is so still on the continent. Its blanched stems, candied with sugar, form a very agreeable sweetmeat, possessing tonic and stomachic qualities. Its roots contain a pungent, aromatic, stimulating principle,

[*Angelica archangelica*, a diminished figure.]

1. A partial umbel of the natural size. 2. A separate flower.
3. The back of one of the partial umbels, showing the bractæ.

which has caused them to be employed in scrofulous diseases, they have been administered in the form of infusion and of powder, as diuretics and sudorifics; but in this country they are no longer employed as curative agents.

A very common wild species, the *Angelica sylvestris*, or wild angelica, which is found all over the meadows near the Thames above London, possesses similar properties, but they are weaker, and therefore less important.

ANGELO (BUONAROTTI, MICHEL), the father of epic painting, and scarcely less distinguished as a sculptor and architect, was descended from the noble family of Canossa in Tuscany. He was born in the year 1474, a period peculiarly favourable to genius, when the states of Italy emulated each other in the cultivation of the liberal arts. Michel Angelo, the bent of whose powers manifested itself in his earliest childhood, learned the elements of design in the school of Domenico Ghirlandaio, a celebrated professor in Florence. While he pursued his studies with this master, a seminary was established for the promotion of sculpture by Lorenzo

de' Medici, and Michel Angelo was invited among other youths to study from the collection of antique statues arranged in the Medicean gardens. It is said that the sight of these splendid works determined him to devote himself entirely to sculpture; he began, not merely by copying, but by investigating the principles on which the Greek artists had wrought, and having found a head of a laughing faun, considerably mutilated, he imitated that part of it which was perfect, and restored what was wanting. Lorenzo, who frequently visited the garden, was struck by this demonstration of vigorous capacity; and being pleased not less with the simple manners of the youth, and his evident devotion to his art, he invited him to reside entirely in his house, where he remained three years, treated with paternal kindness, and having the advantage of associating with the first literary characters of the age. At the suggestion of Politian, who also resided with Lorenzo, he executed for this illustrious patron a basso-relievo in marble, the subject of which was the Battle of the Centaurs; he resumed the pencil also during this period, and made many studies from the works of Masaccio. Lorenzo died in 1492. His brother Pietro continued to patronize Michel Angelo, but in a different spirit. Treating art as a toy, he employed him, during a severe winter, to make a statue of snow; and manifesting in all things the same frivolous spirit, he precipitated, by his bad government, the downfall of his family, which was driven from Florence in 1494. On this event, Michel Angelo retired to Bologna, where he contributed two statues to the church of the Dominicans, and after a year's residence in that city, returned to Florence. During this time he made the celebrated statue of a Sleeping Cupid, which was sent to Rome, where it was shown as a piece of sculpture which had been dug up from a vineyard, and was pronounced by various connoisseurs to be a genuine antique, and superior to anything which contemporary art was capable of producing. This statue having been purchased at a high price by the Cardinal S. Gorgio, the trick became known, and Michel Angelo's reputation was so much augmented by it, that the cardinal, though vexed at the deception, invited him to Rome. He devoted himself during this his first residence in the imperial city, to intense study, and executed several works, particularly a Virgin weeping over the dead body of Christ, for St. Peter's church, which excited astonishment, not only by its excellence, but by the apparent facility with which the greatest difficulties of art were surmounted.

Several great works in art having at this time been projected by the government of Florence, Michel Angelo, at the earnest advice of his friends, returned to that city, and the first undertaking on which he exercised his talents was a gigantic statue of David, hewn from a solid block of marble. This work had been commenced some years previously by one Simon da Fiesole, who, finding that he had undertaken a task wholly beyond his capacity, had abandoned it in despair. The misshapen mass which had been thus left, Michel Angelo accommodated to a new design, and produced from it the sublime statue which ornaments the great square at Florence. The Gonfaloniere, Pietro Soderini, was now anxious to enrich the city with some grand production of Michel Angelo's pencil. Leonardo da Vinci had been commissioned to paint an historical picture for one end of the hall of the Ducal palace, and Michel Angelo was engaged to execute another at the opposite extremity. He selected a subject from the wars of Pisa, in which a number of men, while bathing in the Arno, are surprised by a sudden attack on the city, and start up to repulse the enemy. Trumpets are sounding; some of the warriors endeavour, with gestures of furious impatience, to draw their garments over their wet limbs; others rush half-clad into the combat; horse and foot are intermingled, and the whole scene breathes fierceness and slaughter. This cartoon, with the exception of a few dismembered fragments, has perished, but as long as it existed, it was studied by artists from all countries, and Benvenuto Cellini, a scholar and admirer of Michel Angelo, affirms, that he never equalled it in any of his subsequent productions. Michel Angelo had at this time attained only his twenty-ninth year, and had not only established his reputation as the greatest artist of his day, but had created by the novelty and grandeur of his style a new æra in the arts. Julius II., a pontiff who, in the energetic cast of his character, bore a strong resemblance to Michel Angelo himself, having now succeeded to the papal chair, called him immediately to Rome, and commissioned him to make

work conceived on a scale which Michel Angelo felt to be commensurate to his powers. He made a design, which, had it been finished according to his original intention, would have surpassed in grandeur, beauty, and richness of ornament every ancient and imperial sepulchre. It was to have had four fronts of marble, embellished with forty statues, besides several mezzo-relievi in bronze. To this design Rome and the world are indebted for the magnificent church of St. Peter's; for Michel Angelo having suggested to the pope that the interior of the old edifice would not allow sufficient space for the monument to be properly seen, the pontiff determined to rebuild the church on a larger scale. While the monument was in progress, the pope delighted to come and inspect it; but the work was interrupted by an accident which strongly marks the character of the artist. Having occasion to make some communication to his holiness, and not having found admission on two applications, in the latter of which he felt himself somewhat superciliously treated by one of the officers in attendance, he gave directions to his servants to sell his goods to the Jews, and immediately set off for Florence. He had scarcely reached Poggionbonzi before five couriers had arrived from Julius commanding his immediate return, but Michel Angelo was inflexible, and continued his journey. On arriving at Florence, he set about finishing the cartoon of Pisa, but three briefs were dispatched to Soderini the Gonfaloniere, requiring that he should be sent back. Michel Angelo excused himself, alleging that he had accepted a commission from the Grand Sultan to go to Constantinople for the purpose of building a bridge. The pope, in the mean time, had gone on political affairs to Bologna, and Soderini, fearing he should himself incur the papal displeasure through Michel Angelo's contumacy, persuaded him to go to that city. Immediately on his arrival, and before he had had time to adjust himself, he was conducted by the pope's officers before his holiness, who, looking at him with an angry glance, said, 'What, then! instead of coming to seek us, thou wast determined that we should come to seek thee?' Michel Angelo excused himself, saying, 'that he had quitted Rome, being unable, after his faithful services to his holiness, to endure the indignity of being denied admission to him.' A bishop in attendance, intending to say something in extenuation, observed to the pope, that such persons, however expert in their professions, were usually ignorant of everything else: 'Who told thee to interfere?' exclaimed Julius, bestowing at the same time a hearty blow with his staff on the shoulders of the ecclesiastic, and commanding Michel Angelo to kneel, he gave him his benediction, and received him into full favour, giving him directions at the same time to make his statue in bronze. Michel Angelo soon completed the clay model; the statue was the personification of majesty, but the face had so terrible an expression, that the pope demanded, 'Am I uttering a blessing or a curse?' Michel Angelo replied, 'that he had intended to represent him admonishing the people of Bologna, and inquired if his holiness would have a book placed in one of the hands: 'Give me a sword,' answered the warlike pontiff, 'I know nothing of books.'

On his return to Rome, Julius was induced by the advice of his architect, Bramante, to suspend the execution of the monument, and he gave orders to Michel Angelo to paint the vault of the Sistine Chapel. It is said, that Bramante was instigated by unworthy motives in giving this counsel to the pope, either imagining that the large sums which his holiness was expending in sculpture would leave less at his command for the purposes of architecture; or that Michel Angelo, who preferred the practice of sculpture to that of painting, would incense the Pope by refusing to perform his commission; or finally, that, should he attempt it, he would expose his inferiority as a painter to Raffaele d'Urbino, who was Bramante's nephew. Such are the motives ascribed to Bramante, although, it would appear, on no very rational grounds. If, however, Bramante was really actuated by any unworthy motive, never did an evil intention more completely defeat itself. Michel Angelo, indeed, who was absorbed in the execution of the monument, most earnestly endeavoured to decline the task of painting the chapel, and even alleged that he thought Raffaele better qualified to perform it; but Pope Julius allowed no impediment to stand in the way of his will, and Michel Angelo, finding himself without an alternative, and impressed with a sense of the vastness and grandeur of the task, commenced his cartoons. He invited from Florence several artists distinguished as painters in fresco, a mode of

the chapel was commenced by these assistants, under his direction; their execution, however, fell short of his expectations, and entering the chapel one morning, he dismissed them all, threw their work from the walls, and determined on executing the whole himself. Having advanced to the third compartment, he had the mortification to find his labour frustrated by the bad quality of his materials, in which fermentation had taken place, and in utter disappointment he renounced the undertaking. The pope, being made acquainted with this misfortune, sent to him his architect, San Gallo, who investigated the cause of the failure, and taught him how to correct it. Thus reassured, he proceeded, and the pontiff hearing at length that the ceiling was half completed, could control his impatience no longer, and ordered the chapel to be opened for his inspection. Many other persons found admission, and among the rest Raffaele d'Urbino, who then first became acquainted with Michel Angelo's powers as a painter. Struck with admiration, he immediately changed his own style, and with the candour natural to a great mind, thanked God that he had been born in the same age with so great an artist. The work was now carried forward without interruption, and the whole was completed within one year and eight months from the time of its commencement; an achievement which, whether we consider the magnitude and sublimity of the performance, or the almost incredibly short time in which it was executed, is unparalleled in the history of art. The chapel was opened on All Saints' day, with a solemn mass, at which the pope assisted in person. The roof is divided into twelve compartments, in which is painted the history of the antediluvian world. In three of the first compartments Michel Angelo has personified the Supreme Being, dividing the light from the darkness—creating the sun and moon—and giving life to Adam. The attempt to portray the Deity by visible representation is repugnant to our present ideas, but it was at that time sanctioned by the church, and is almost atoned for by those images of divine power and majesty which Michel Angelo has here embodied. The eleventh subject of the series on the roof is the Deluge, and the twelfth is from the story of Noah, showing the remnant of the human race preserved after that awful event. On the sides of the chapel is a series of designs representing the persons who compose the genealogy of Christ, and between these compartments are the colossal figures of the Prophets and Sibyls, seated in solemn meditation. The effect of the whole work is adapted with admirable accuracy to the vast height at which it is seen, and it is impossible to contemplate it without reverence and astonishment. The reign of Julius terminated in 1513, when Leo X. succeeded.

It might have been expected that Leo X., whose name is associated with the ideas of taste and munificence, and who affected fully to appreciate the powers of Michel Angelo, would have engaged him on some work worthy of his talents. There is, however, in his whole conduct towards this great artist a display of injustice not easily explained. He obtruded on him the task of building the façade of the church of S. Lorenzo at Florence—a commission against which the artist most strenuously protested; but the pope overruled all objections, and compelled him to go to Carrara, in order to excavate marble for the purpose. He was afterwards directed to procure it from the quarries of Pietra Santa: the difficulties of conveying it hence were found almost insurmountable, and we cannot read without surprise and indignation, that during the whole pontificate of Leo, a period of eight years, this extraordinary man was employed in hewing rocks and excavating a road. The short reign of Adrian VI. which followed, although generally unfavourable to the arts, was less injurious to Michel Angelo, as it allowed him leisure to proceed with the monument of Julius II.: but on the accession of Clement VII. that work was again interrupted, and he was called on by the new pontiff to build a library and sacristy for the church of S. Lorenzo. The civil wars of Florence ensued soon after, and we find Michel Angelo acting in the capacity of engineer. On the expulsion of the Medici he was appointed superintendent of the fortifications by the local government, and he evinced extraordinary skill in fortifying the important post of San Miniato. Having continued his services until he felt that they could no longer be effectual, and considering the fall of the city inevitable, he withdrew to Venice, and during his residence there, it is affirmed by some authorities, that he gave the design for the bridge of the Rialto.

He returned to Florence at the earnest entreaty of his fellow-citizens, who seemed to attach more importance than himself to his services, but, as he had foreseen, the city was soon after compelled to surrender, and he judged it prudent to conceal himself, as did several of the citizens who had distinguished themselves in its defence. Michel Angelo has been reproached with ingratitude to the Medici for the part he took in those transactions, but he is, perhaps, to be praised rather than condemned for having sacrificed his private feelings to the duty he owed his country. As soon as the tumult consequent on the sack of the city had subsided, Clement VI. ordered strict search to be made for Michel Angelo, received him kindly, consulted him on various works, and the great picture of the Last Judgment was then projected. The death of Clement, in 1533, suspended these intentions, and Michel Angelo now hoped that he should be enabled to complete the monument of Julius II. This work had been the favourite employment of his life, and he had devoted to it all his powers, but it had proved to him, almost from its commencement, a source of inquietude. Each pontiff, since the death of Julius, had on his accession demanded the services of Michel Angelo, and compelled him, in spite of his earnest remonstrances, to discontinue his labours on the monument: in the meantime, the heirs of Julius, being impatient for its completion, harassed him with threats and complaints, large sums of money having been paid him during the progress of the work. Clement VI. insisted that Michel Angelo had a right to consider himself rather the creditor than the debtor; but Paul III., when Michel Angelo urged his obligation to the heirs of Julius, as a reason for declining the commission, he offered him, threatened to tear the contract with his own hands. He came, however, attended by ten cardinals, to see the work which had occasioned so much litigation, and pronounced it to be miraculous. Being shown, at the same time, the cartoons which had been prepared for the Last Judgment, he determined that nothing should impede the immediate execution of that work, and undertook to arbitrate himself between Michel Angelo and the heirs of Julius. The monument was at length finished, by mutual agreement, on a smaller scale than had been originally projected, and placed in the church of San Pietro in Vincolo. Michel Angelo now found himself at liberty to proceed with the picture of the Last Judgment: he devoted to that intricate work the labour of eight years, and it was finished in 1511. We are accustomed to connect with this performance an impression of everything which is great in art; nevertheless, whoever expects to find in it that which is usually attached to our ideas of painting, an effect agreeable to the eye, will be utterly disappointed. Art, indeed, was not at that time considered a medium of amusement merely, but a vehicle for religious impressions; and as the leading feeling associated with the awful idea of the last judgment is that of terror, so Michel Angelo has made terror the predominating sentiment of his picture. In the Messiah we see rather the inexorable judge than the merciful Redeemer: he turns to the left, and fulminates his sentence on the wicked, who fall thunder-struck. These groups, precipitated through the air, are seized by demons who spring from the abyss beneath. This is the finest part of the picture, for there is little among the groups of the righteous, who on the opposite side are ascending into heaven, which expresses the happiness of the blessed. That part of the picture in which the dead are seen rising from their graves is admirable. The excellence of the work consists in the unparalleled powers of invention displayed in the various groups, and in the profound knowledge of the human figure by which the artist was enabled so effectually to embody his conceptions; but considering the composition as a whole, it must be acknowledged, that, without impairing the solemn impression proper to the subject, a more picturesque arrangement might have been admitted, and that even the sentiment would have been augmented by more powerful combinations of light and shadow. It was pronounced by contemporary criticism that Michel Angelo had in that work excelled all his former productions; but the deliberate judgment of time, we believe, inclines to decide that his great name as a painter is better sustained by the compartments in the roof, and on the sides of the Sistine chapel, than by the picture of the Last Judgment. The career of Michel Angelo is an example of the splendid results produced by great powers in conjunction with great opportunities. We next find him engaged in constructing the magnificent fabric of St. Peter's church. He

began by substituting for the Saracenic design of San Gall, a more Christian and superb model in the shape of a Greek cross. 'This fabric,' to use the language of Fuseli, 'scattered into infinity of jarring parts by his predecessors, he concentrated; suspended the cupola, and to the most complex, gave the air of the most simple of edifices.' On this work he was occupied during the whole remainder of his life. He found opportunities, however, to direct fortifications, to adorn the Capitol with magnificent buildings, to finish the Farnese palace, and give designs for other works of architecture. But circumstances connected with the building of the church embittered his latter years with serious causes of trouble. As he had occasion, among the number of persons employed in the undertaking, to promote some and dismiss others, he was beset by cabals, and harassed by opposition; and machinations were even employed to deprive him of his office: but he was uniformly supported by the pontiffs, especially by Julius III., who regarded him with profound respect and veneration. Old age came upon him not unaccompanied with the physical infirmities which belong to it, but he retained the vigour and alacrity of his mental faculties to the close of his long life. He died on the 17th February, 1563, having nearly attained his 89th year. His last words were, 'In your passage through this life, remember the sufferings of Jesus Christ.' He was buried with due honours in the church of the Apostoli at Rome; but his remains were afterwards removed to the church of Santa Croce, at Florence.

Considered either in relation to the degree or the variety of his talents, Michel Angelo holds a foremost place among the great men of an age which has left the most durable impressions upon the arts and literature of Europe. As a painter and sculptor he created his own style, which, as it owed nothing to his predecessors, so it has remained unapproachable either by rivalry or imitation. As an architect, he converted the fabric of St. Peter's from an incongruous structure into the noblest temple which was ever erected to the honour of the Deity. The few poetic compositions which Michel Angelo has left can add little to his vast reputation, except as an evidence of his versatility; it may be observed, however, that they are by no means unworthy of such a mind, and that, even in point of versification, they rank among the best in Italian literature. His talents in engineering need no other attestation than the fact, that Vauban, the celebrated French engineer, in passing through Florence, was so impressed with the skill evinced in the fortifications of San Miniato, that he ordered plans and models of them to be made for his own especial study. The moral qualities also of Michel Angelo

entitled to our respect. He was benevolent, temperate, and pious; and although he felt the dignity of his own character, and knew how to enforce respect from the arrogant and the supercilious, in his general deportment he was mild and unassuming. He had acquired considerable wealth by the exercise of his various talents, and he employed it liberally: he assisted his friends, provided for his servants, and during the siege of Florence, he supplied the government with sums by no means inconsiderable, considered as the contribution of an individual. For the labour of building St. Peter's church, continued through many years, he refused all remuneration, declaring that he dedicated that service to the glory of God. Although no man was ever more entitled to the claim of intuitive talent than Michel Angelo, no man ever trusted to it less: his practice was incessant, he continued his studies to the last, and so untiring was his energy, that even while engaged in the military operations of Florence, he proceeded with his works in statuary and painting. His predilections were decidedly in favour of sculpture, in preference to the other arts: yet it may be doubted whether his reputation is not more permanently based on his paintings in the Sistine chapel. Beauty, so essential an element in sculpture, was certainly not the branch of art in which he excelled: nevertheless, in subjects wherein that quality is not indispensable, he sometimes reaches a point of unimagined excellence; nor can there be found perhaps, in the whole range of Greek sculpture, any thing approximating to the profound sentiment and terrible energy exhibited in the statues of Lorenzo and of Moses. As a painter, he has no competitor in the highest qualities of art, except Raffaele, to whom, it appears to us, he stands in the same relation which, in our literature, Milton bears to Shakspeare. In depth of pathos, in discriminated expression, in varieties of character, and the power of telling his story, Raffaele is certainly superior to Michel Angelo;

but if the truth of that axiom be admitted, that sublimity, in its highest degree, is more than an equivalent for all other qualities, then is Michel Angelo, without doubt, the greatest painter that ever existed.

ANGELO CARAVAGGIO. [See CARAVAGGIO.]

ANGELN is that part of Schleswig which is enclosed by the bay of Flensburg, the Baltic, and the Schlei. The largest diameter of this district, from N. to S. and from E. to W., is about twenty English miles. Its surface comprehends about 230 square miles, of which the population amounts to 30,000. Among their neighbours the inhabitants are distinguished for bodily strength, an independent spirit, and love of liberty; they are industrious, and in a country where the criminal calendar is insignificant, they contribute towards it the smallest number: in this district prosperity is general. The eastern part of it is very fertile; the western is more sandy: of late great progress has been made in agriculture: but the roads are so indifferent, that they are a subject of general complaint. *Angeln* has not, like other parts of Schleswig, a peculiar political constitution. Fifteen of its northern parishes belong to the *Amt* (the government or county) of *Flensburg*, and the eighteen southern ones to that of *Gottorf*.

ANGER, (according to Aristotle, *Rhetor.* b. ii., c. 2.) is a desire of revenge, accompanied with pain, on account of an apparent slight improperly offered to a person or some one connected with him. From this definition it appears, first, that in order to excite the passion of anger it is necessary that a slight should be offered; and secondly, that the slight produces a desire of revenge, which is painful until it is either gratified or assuaged. A slight is an act or forbearance by which a man appears to indicate his opinion that another person is not worthy of notice; and it may be shown both in active and passive conduct: actively, as when a person insults, reviles, ridicules and banters, or annoys, vexes and teases another: passively, as when a person omits the marks of attention and respect which an inferior owes to a superior, or an equal to an equal, or when he treats another with contempt. In the cases of abuse, insult, and unseemly or misplaced ridicule, as well as where there is a scornful indifference or a want of respectful behaviour, the pain is caused by the undue assumption by which an equal appears to make himself a superior, and an inferior an equal. Hence it is (as an ancient historian has remarked) that men care more for insult than injury; as the one seems to be the aggression of an equal, for his own profit: the other to be the insolence of a superior, arising from spite or mere wantonness*. In the cases of annoyance and vexation, the pain of the person angered is caused by the feeling that the object of the other party is purely to give pain, without any advantage accruing to himself.

The pain excited by the slight is instantly followed by a desire of revenge. The desire of revenge is not a general desire that ill may come to the person offering the slight, but a desire of personally punishing him, so that he may know by whom the pain is inflicted, and the person angered may have the gratification of being himself the executioner of his own retribution. The satisfaction of the desire of vengeance is always pleasurable, and in brutal and uncultivated minds is attended with all the marks of the most triumphant exultation. So strong indeed is the temptation of gratifying this craving after retaliation, when the means of indulging it are in our power, and so great the difficulty of foregoing the pleasure which it affords, that Shakspeare enumerates among the rare instances of female perfection—

* She who being angered, her revenge being nigh,
Bids her wrong stop, and her displeasure fly.*

No angry person, however, would feel his desire of revenge satisfied by learning that the object of his anger has suffered some grievous calamity, as that he has lost a near relation or a large sum of money: he wishes that the pain should be inflicted *in return* for the slight shown to him, and by *his own* agency. Anger, therefore, is different from hatred: the one is a passion which is commonly extinguished by the lapse of time, even if the desire of vengeance is not satisfied; the other is a settled habit of the mind which never varies: the one is attended with pain, the other is without pain. Anger is always personal, and is felt only towards individuals. Hatred is often general, and embraces not only individuals, but whole classes, as murderers, tyrants, heretics, &c. There are even national hatreds, and misanthropy

* On a similar reason was founded the advice of Bernadotte to Louis XVIII that France was to be governed with an *iron hand*, and a *retract glove*: a mark capable of a much wider extension.

is a hatred of the *whole human race*. Anger is often satisfied with a slight infliction of pain, whereas hatred desires nothing less than the extinction of the persons hated; hence pity is consistent with anger, but never with hatred. Anger seeks to inflict pain; hatred desires to do harm. Anger requires a personal retaliation, hatred is pleased that harm should come to the person hated, from whatever quarter, and by whatever means. (See Aristot. *Rhet.*, b. 2, c. 4.)

As anger is a bad passion, the object of which is the infliction of pain, it ought to be restrained; and one of the most important parts of moral discipline is the proper regulation of the desire of revenge which characterises it. The proper government of this passion consists not in altogether suppressing it, which is indeed impossible, as every person must feel pained at an undeserved slight, but in repressing the desire of vengeance to which that pain gives rise. It is a rule, to which every exception should be questioned with the utmost jealousy, that in a political society all vengeance for vengeance sake is immoral. This, however, does not prevent a person from showing *his displeasure* at an improper slight; so that the reproof be given without animosity, and arise from a desire of preventing future affronts or vexation, not of satiating a thirst for revenge.

Although anger is a bad passion, and in a state of civil society its effects are much oftener hurtful than beneficial, its *use* (or, as is sometimes said, its *final cause*) is not the less obvious. In a state of nature, before the institution of government, if instead of men being prompted by the constant and violent influence of a passion to retaliate harm for harm, the retribution of wrongs had been left to the irregular operation of cool reason, it may be doubted whether the collision of interests and the mutual resistance which arose from each man being the avenger of his own cause, and which were the origin of political government, would ever have existed.^b Hence revenge (as Lord Bacon has said) is a sort of wild justice; that is, in a society where there is no administration of law, it takes the place of legal justice; and it is better that wrongs should be avenged than that they should be done with entire impunity.^c In the barbarous states of society which have prevailed at different times in Arabia, Greece, Germany, Scotland, and other countries, the imperfect security of person which existed was owing chiefly to the duty of revenge imposed by traditional feelings and opinions on the family of a murdered person. But when the exercise of sovereign political power is once firmly established, together with an efficient administration of law by regular judicatories, the use of revenge, as an instrument for the repression of wrongs, has ceased, and it must give place to a far better substitute. The good, says the French proverb, is the enemy of the better; and on this principle, a political society, both in its legal and moral code, must discard that instrument to which it may, indeed, in great measure owe its *existence*, but which is incompatible with its *continuance* in a state of happiness and tranquillity. The private retaliation of wrongs is the scaffolding by means of which the structure of civil society was erected, but which disfigures its beauty and impairs its utility when completed. [See PUNISHMENT.]

ANGERBURG, one of the circles of the government of Gumbinnen, in the province of eastern Prussia, containing a surface of 360 square miles, and about 26,000 inhabitants. Angerburg is the name also of a small town, with a castle, lying on the Gross-Maner Lake, in this province. It makes linens and woollens; has a manufactory of salt, and fishery; and some trade in timber. The population is about 2900. It is in 54° 8' N. lat., 22° 15' E. long.; seventy miles S.E. of Königsberg.

ANGERMANLAND is a province of Sweden on the Baltic Sea, or rather on that narrow part of it, called the Gulf of Bothnia. It is now comprehended under the political division of Angermanland-Län or Hernösund-Län, of which it forms the northern, most extensive, and important part; the southern, and smaller, is the ancient province of Medelpad. The political union of these provinces obliges us to treat of them together, which may be done the more easily, as they resemble one another in almost every respect.

^b It is remarked by Soame Jenyns, that those effects which were required to be constantly produced by mankind, such as the nourishment of the body by eating and drinking, its preservation from physical harm, the propagation of the species, &c., have been entrusted by Providence to our appetites or passions, and never to our reason; the operation of the former being regular and uninterrupted, of the latter capricious and uncertain. See the admirable review of his metaphysical work by Dr. Johnson.

^c See Bishop Butler's *Sermon on Repentment*.

Angermanland-Län extends from 62° 10' to 64° 20' N. lat., and from 15° 40' to 19° 20' E. long. Its greatest length lies along the coast, and may amount to between 140 and 150 miles. Its breadth varies from about 20 to 100 miles. On the north it is bounded by Umea-Län or Western Bothnia, on the west by Östersund-Län or Yämtland, on the south by Gelle-Län or Helsingland, and on the east by the Gulf of Bothnia. Its area is calculated to amount to 216 Swedish or 9508 English square miles, so that this province is somewhat larger than the counties of Northumberland, Durham, and York taken together.

The surface of this extensive country varies extremely. On the coast, hills succeed hills without interruption; they are steep and rise sometimes to nearly a thousand feet above the level of the sea. They are divided from one another by steep valleys several hundred feet deep, the bottom of which is occupied by winding rivers, or fine mountain-lakes, on the banks of which meadows and woods are intermingled in the most pleasant manner: the woods commonly clothe the slopes of the hills and sometimes their summits. If to this picture we add the inlets of the sea, which often pass through the narrow openings between the hills, and the large, rapid rivers, expanding at intervals like lakes, we shall acknowledge the justness of the opinion of Dr. Clarke, who compares this province with the country about the Lago Maggiore in Italy, and affirms that all this part of Sweden is as much worth seeing, and would as amply repay the trouble of a journey thither, as any part of Europe. But this description only applies to the coast and to the country extending about twenty or twenty-five miles from it. Farther westward, no insulated mountains are seen, the whole country, for a distance of about ten miles and upwards, rising higher and higher to more than a thousand feet above the level of the sea, and on this height it runs on almost like a plain through Jämtland till it reaches the foot of the Scandinavian mountains, and the boundary of Norway. From these heights the rivers descend in long, and sometimes narrow valleys, and in their descent frequently form cataracts.

The coast of this country, though high, rarely rises to 200 feet, and is very much intersected by bays, some of which run several miles into the land, especially Håmmarsund-Fiard, Deger-Fiard, and Ulångers-Fiard, all three situated to the north of the mouth of the Angerman-Elf. An uninterrupted series of islands extends along the coast; most of which are small, uninhabited rocks, called *skär* (pronounced *share*), only visited in summer by fishermen. Some, however, are several miles in length, as Brömön, to the south of the mouth of the Ljungan-Elf, Alnön, opposite to the Sundswall, and Hernö and Hamsö, in the embouchure of the Angerman-Elf.

The rivers which traverse Angermanland-Län are the largest in Sweden, but they do not rise in the province. Their sources are in the Scandinavian mountains, to which this province does not extend. The most important is the Angerman-Elf, which rises in an alpine lake, called Kultsylvän, near the boundary of Norway, in that part of Umea-Län called Asele Lapmark. Running for nearly half its course in a south eastern direction, it receives all the waters descending from the Styelling Föttl, and the great chain in Asele Lapmark: it then enters, by a southerly course, Angermanland, where its waters are increased by two large rivers, coming down from Jämtland. Its general course is still directed to the south or south-south east. No river of Sweden is, in its natural state, navigable, so far as the Angerman-Elf. It may be ascended by vessels of every description upwards of forty-five miles, and by merchant-vessels to Sollefå, nearly sixty miles. At the last place the navigation is interrupted by a cataract, and higher up, other water-falls likewise impede the transport of goods. But, of late years, the Swedish government has paid much attention to rendering it navigable. Not far from its mouth Dr. Clarke found the breadth of the river from one and a half to two miles, and he adds, that the Rhine exhibits nothing grander, and that the banks of the latter are at no place more beautifully adorned, than those of the Angerman-Elf. The whole course of the river amounts to upward of 240 miles. The Indals-Elf, which traverses the southern part of Angermanland-Län, or Medelpad, is properly only the channel by which the lake called Storsjön (the great lake) discharges its waters. This lake is situated in Jämtland, surrounded by an elevated country, which exhibits high, and even snow-covered mountains on the west and south. From

these mountains numerous rapid rivers descend to the lake, which discharges these collected waters by one outlet, the river Indals-Elf. It issues from the lake on its northern side, and flows for some distance to the north; it then turns to the east, and descends from the high-lands to the coast, and in this descent still receives some considerable rivers. The latter part of its course is to the south-east. It is one of the swiftest rivers of Sweden, full of rapids and cataracts, and only navigable for boats and craft, for a short distance. Its inundations are much dreaded; one of them, in 1796, laid waste all the valleys through which it flows, and changed the course of the river in many places. Since that time its water has been turbid, and the salmon and other fish, which formerly abounded, have left it: only a kind of whiting (*salmo lavaretus*) is occasionally taken. It runs about 140 miles. The third and most southern river is the Ljungan-Elf. It rises in that part of Ostersunds-Lan which bears the name of Heryedalán, in the most elevated part of the Scandinavian peninsula, from which it descends with a rapid course through a narrow valley: but as it approaches the boundary of Angermanland-Lan the valley widens and the course of the river becomes less rapid. After its entry into this province it receives its only great tributary, the Gimán, and falls into the sea to the south of Sundswall. Twenty years ago this river was not navigable; but since the cession of Finland to Russia it has been rendered navigable in many parts of its course in order that Stockholm may not be under the necessity of deriving its firewood from a foreign country. By examination it was ascertained that two-thirds of this river may be rendered fit at least for floating down the wood and timber which abound on its banks. Its course can hardly be less than 200 miles.

The lakes though small are very numerous, and, according to the calculation of Forsell in his statistical tables, occupy more than one-tenth of the whole surface, or, more exactly, 22·22 Swedish or 977·68 English square miles.

The climate, though very healthy, is also very severe, as might be expected in such a latitude. The winter commonly lasts seven or even eight months, and people often travel in sledges in May. Then follows a spring of two or three weeks, and the summer begins in the middle of June. The heat increases rapidly, and the vegetation is so vigorous, that in a couple of days the grass attains the length of a finger, and commonly more: rarely eleven or twelve weeks pass between the sowing and the reaping of the corn. The sky is generally serene and clear, and rain is not frequent, and very rarely continues half a day. But the valleys are covered in the morning by a dense fog, rising from the lakes and rivers, which imparts the necessary moisture to the fields, and hinders the night-frosts in August and September from damaging the crop. The summer ends in the beginning of September, a short autumn follows, rarely longer than the spring, and then comes the winter with all its severity.

Travellers commonly speak with rapture of the fertility of this province, and assert that it surpasses all the other parts of Sweden. But this remark can only apply to tracts of very small extent, especially to the valleys along the large rivers, and to the low land about the lakes. By far the greatest part is sterile: and all the broad and long ridges of the high country contribute little or nothing to the maintenance of the inhabitants. In Forsell's table the arable land is calculated to occupy only 1·28 Swedish, or little more than 56 English square miles, consequently not much more than one-fourth of the surface of the smallest of our counties, Rutlandshire. The meadows extend over a space equal to 6·10 Swedish, or 281 English square miles, nearly the extent of Middlesex. The remainder is covered with mountains, heath, and forests, which only furnish abundant pasture in summer.

Bears, wolves, and foxes, are numerous, but the two former only in those parts which are distant from the coast. Deer was formerly found in greater numbers, but has much decreased, except roe-deer, which is still frequent in many parts. The elk is only met with in some forests of Medelpad. The smaller animals whose skin is used as fur, as hermelins, martens, &c., are found everywhere, but not in any great numbers.

Blackbirds of a large size, woodcocks, heathcocks, and partridges exist in the forests in such numbers, as can hardly be conceived. Many thousands are annually killed, and brought in winter to Stockholm and even to Gothen-

burg, from which latter place some are brought to England. Eagles of considerable size inhabit the solitary places.

Fish abound in the sea, the rivers, and the lakes. The sea-fishery affords a livelihood to many families by the immense number of strömlings, a smaller kind of herrings, which in summer-time are caught along the coast. This fish is found along the whole eastern coast of Sweden, but is nowhere so numerous as here, which brings the fishermen from more southern places, especially from Gelle, to pass the summer on the islands along the coast. The produce of this fishery is not exported, but it forms an important branch of internal commerce. In the rivers the salmon-fishery is important, especially in the Angerman Elf and Ljungan-Elf: trout also abound in some of them.

The forests which cover the greatest part of the country, the upper part of the slopes, and even sometimes the tops of the hills and mountains, consist chiefly of pine, fir, and birch. The oak does not succeed, on account of the severity and length of the winters. These forests not only afford the necessary firewood to the inhabitants, but also some articles of exportation. In some of the higher parts of the country, where the crops are scanty and subject to be destroyed by the early night-frost in September, the inner bark of the pine is mingled with flour in making bread.

The metallic riches of this province are not important. Iron, indeed, is found in some places towards the boundary of Jämtland, but is not much worked.

Fruit-trees do not succeed to the north of 62° 30', and the last apple-trees which produce ripe fruits grow at Sundswall. At Hernösand apple-trees are planted, but the fruit does not ripen. Nature, however, has supplied this deficiency by numerous kinds of wild-growing berries. Besides different sorts of vaccinium and rubus, which are common in some other parts of Europe, there are two species of delicious berries, which are peculiar to the north of Sweden, the *rubus arcticus*, and the *rubus chamaemorus*, or cranberry, of which the first is by far the more delicate, and very extensively used; all trials to transplant it to the south of 62° have been unavailing. Cranberries are exported to England.

Though only a very small portion of the whole surface is allotted to agriculture, it cannot be said that this most important branch of industry is neglected: not only are the fields cultivated with great care and attention, but continual efforts are made to extend the dominion of agriculture more and more. The inducement is great, as the produce of agriculture is by no means sufficient for home consumption, and a considerable quantity of corn is imported from Wasa and other towns of Finland. Rye, barley, and oats succeed pretty well, whenever they are not destroyed by early night-frost. Wheat does not succeed every year, and therefore its culture has been almost entirely abandoned. The culture of flax and potatoes is extensive, though the former does not ripen to seed. Hemp is, likewise, cultivated. The kitchen-gardens are commonly only planted with cabbages and turnips.

The uncultivated ground in the woods, and on the long and broad backs of the mountains, affords pasture in abundance, and, consequently, the rearing of cattle is an important branch of industry. But as these pastures are very distant from the villages to which they belong, a custom has been introduced which also prevails in the Alps of Switzerland: the cattle are sent in June to the pasture, accompanied only by one or two girls, who pass the whole summer in a cottage rudely constructed of wood and branches of trees, take care of the cattle, defend it from the bears, and perform the labours of the dairy. As the summer pasture is so abundant, the inhabitants are much more intent on extending their meadows than their corn-fields; that they may be able to increase their stock of cattle, and not want the necessary fodder for the winter. Many persons, therefore, who are obliged to buy corn, bring considerable quantities of butter to the market, and even some cheese of indifferent quality. Their cattle is of a middling, or rather small size, but well adapted for their pasture. Horses are bred in numbers; they are also of a middling size, but larger than those of the southern provinces of Sweden, swift and hardy. Sheep too are numerous, but the wool is coarse, and only employed by the country people for their own use. The pig is not much attended to, because this animal encroaches on the food of man, which here is rather scarce. In many places in the higher valleys goats are kept in great numbers.

The scanty population of this country might lead us to suppose that no kind of manufacturing industry could be maintained, but this is not the case. The manufacture of linen is very extensive. Great quantities of it are made, especially in the country along the coast to the north of Hernösand. The finer sorts are said not to be inferior to those of Holland, but many think that this assertion is somewhat too favourable to the Swedish peasant women who make it. At all events, the manufacture is considerable, as in the year 1825 not less than 595,870 ells (of nearly two English feet) were exported to Stockholm. The legislature of Sweden has encouraged this branch of industry by premiums, and since that time not only all the flax grown in the province, but also a considerable quantity brought from Russia, is worked up. No other branch of manufacturing industry is carried to any extent, because the peasants, living at great distances from one another, have been accustomed to satisfy all their necessities by their own labour.

Since government has rendered the rivers more navigable than they were twenty years ago, great quantities of timber are floated down the Angerman-Elf and the Ljungan-Elf. The timber is sawed and sent to England. The exportation in 1825 amounted to 16,379 dozen planks and boards, and since that period it has much increased. Tar is also made, but much less than in the more northern province of Umea-Län.

The coasting trade to and from Stockholm, and some places in Finland, gives occupation to some people who live in the lower valley of the Angerman-Elf.

To maintain internal commerce, some annual fairs are established in the more inland parts of the country. That of Sollefå, up to which place the Angerman-Elf is navigable for merchant-vessels, as we have already observed, is known over all the north of Sweden, and visited by Laplanders, Norwegians, and even by merchants of Stockholm. Here are sold horses, fish, butter, hides, tallow, rein-deer, meat, &c., to a large amount. Another fair is held at Hammar, likewise on the banks of the Angerman-Elf, but it is not so considerable; planks and boards, and coarse linen, are the chief articles sold here. But such fairs are a poor substitute for a town, well provided with shops and every kind of merchandise. This has induced some peasants to become travelling merchants, and these people go on business as far as Stockholm and Drontheim in Norway, whence they import many fine horses.

The two towns of Angermanland-Län are Hernösand and Sundswall. The former, the capital of the province, and the seat of the provincial government, is situated on the island of Hernö, at the mouth of the Angerman-Elf, and joined to the continent by a bridge. The bays between the island and the continent form the spacious harbour of the town, which itself consists of well-looking houses, mostly built of wood. Its streets are large, and, for the most part, paved. The principal articles shipped here are planks and deals, and the linen made by the country people. The first go to England, the latter to Stockholm. But the greatest part of the inhabitants, whose number in 1825 amounted only to 1810, gain their livelihood by the fishery of the strömlings. A few vessels are built. This town has an excellent grammar-school, a society for the improvement of agriculture, an hospital, and a poor-house.

Sundswall is situated in the southern part of Angermanland-Län, or in Medelpad, in a very fine, pleasant valley, much admired by Dr. Clarke and other travellers, and on a bay, into which the Ljungan-Elf discharges its waters, opposite the island of Alnön. The houses are neat, though mostly of wood, but the streets not paved. It has some commerce, especially in planks and deals; but the greater part of the inhabitants, who, in 1825, amounted to upwards of 1600, are engaged in the fishery of the strömling.

At Wifsta, a small place, with a good and safe harbour, five miles to the north of Sundswall, a few vessels are built. There are besides two other places, from which great quantities of planks are shipped, Nyland, on the Angerman-Elf, about twenty-four miles from its mouth, and Sätwick, at the embouchure of the Ljungan-Elf. The property of the latter harbour has been acquired by an English mercantile house, Peter Dixon and Company.

The whole population of this country was, about the middle of the last century, estimated at about 42,000; but the census of 1825 gives it 72,237; and for the year 1830, it was calculated, by Forsell, to amount to 78,821: so that every English

square mile, at present, is inhabited by only eight or nine persons. The inhabitants are nearly all of Swedish origin. A few Finlanders, who settled among them two centuries ago, have lost their peculiar habits and customs, and nearly their language. The Laplanders, and their herds of rein-deer, pass the winter in the higher parts of the province, but in the summer they leave it, and go to the mountains. No part of this country rises to 2200 feet above the level of the sea, which, according to Von Buch, is the height on which these animals find, in summer, the climate and pasture adapted to them.

The inhabitants of Angermanland are of a middling size, and do not attain the large stature of the Dalecarlians; but they are stout, vigorous, and, at the same time, quick in their motions and work. They are gifted with great talent, and show it in some arts, especially in architecture and carving. Many churches are built by simple peasants, and the rules of acoustics exactly observed. Their manners are frank, courteous, and graceful, more than those of the other inhabitants of Sweden. They are of a cheerful temper, good-natured, and hospitable. Their houses have the appearance of neatness and prosperity, and this appearance is by no means fallacious: for the people are actually more prosperous and wealthy than other Swedes, inasmuch as they are also more laborious and industrious.

The town of Hernösand is the seat of a bishop, whose diocese extends over the whole north of Sweden: besides Hernösands-Län, he has the inspection of the clergy in Östersunds-Län, Umea-Län, and Pitea-Län.

(See Von Buch's *Travels through Norway and Lapland*; Dr. Clarke's *Travels in various parts of Europe, Asia, and Africa*; Schubert's *Travels through Sweden, Lapland, Norway, Finland, and Ingermanland*; and Forsell's *Statistical Tables*; Map of Forsell.)

ANGERMUENDE, a circle in the Prussian province of Brandenburg, containing 25,000 inhabitants. Also the capital of the preceding circle, built on the shore of a small lake; it has a population of 3000 souls, produces woollens and linens, and raises some tobacco. It lies forty miles north of Berlin.

ANGERS, an important town in France, in the department of Maine and Loire, of which it is the capital now, as it once was of the province of Anjou. It is on the banks of the Mayenne, (chiefly on a gentle declivity rising from the east or left bank,) a little below its junction with the Sarthe, and a very few miles above its influx into the Loire. In the ancient parts of the town the streets are narrow, and many of the houses are built of wood, though in some the wood is concealed by a thin covering of slate; several have open galleries in front and deep projecting roofs, which appear calculated to afford the shelter required by the climate; the galleries are light and carved in stone, and the vine, which grows luxuriantly in the district, is frequently seen entwined round their Gothic mouldings, or running across the street from house to house. The more modern quarters are regularly and well built. Among the principal edifices are the castle and the cathedral. The former on a steep rock, at the base of which the Mayenne flows, has walls of great height and thickness, flanked by eighteen massive circular towers, the work of early ages; the chapel and palace within the castle, built by René of Anjou, in the fifteenth century, are of much later date than the rest of the building. It is defended on the side of the town by a deep moat. The town itself is surrounded by ancient and extensive walls, of dark brown stone, and strengthened by towers. The cathedral, dedicated to St. Maurice, stands on an eminence in the centre of the town; it has two lofty spires. The architecture of the interior exhibits exquisite work, and there is fine painted glass and tapestry of great antiquity. The tomb which contained the remains of René, king of Sicily (above mentioned), and of his daughter, Margaret of Anjou, queen of our Henry VI., was destroyed at the revolution, during which many convents (they were numerous in Angers) were destroyed, the ruins of which still remain. There are the fragments of a Gothic bridge over the Mayenne, which once served to connect the town with some fortifications on the opposite bank; and a church, remarkable for its curious and ancient architecture, is in the state in which it was left by our King John, who committed great devastation in this place. There are several public walks, as the 'Turcie,' the 'Champ de Mars,' and 'Le Bout du Monde,' (the world's end,) &c.

The manufactures of Angers are of sail-cloth, camblet,

serge, handkerchiefs, hosiery, &c.; and there are establishments for bleaching wax, and refining sugar. Besides the articles from their own factories, the inhabitants carry on a trade in the agricultural produce of the surrounding district, corn, wine and brandy, flax, hemp, wax, honey, and dried fruits. In the neighbourhood are extensive late-quarries, which give employment to 3000 workmen, and furnish annually 80,000,000 slates. The population of the town is about 30,000, which is rather less than that given in the *Encyclopédie Méthodique*, (Paris, 1782,) viz., 31,000, showing a diminution within the last half century. In 1670, before the revocation of the edict of Nantes, it is said to have been 50,000.

Angers is the see of a bishop, and the seat of a '*cour royale*' (assize court). It has an '*académie*,'* '*collège royal*,' (high school,) a school for the deaf and dumb, and a '*séminaire*,' (place of education for the priesthood,) a public library of 26,000 volumes, a museum of natural history, a fine collection of French paintings, a botanic garden, an agricultural society, and a royal school of arts and trades. The hospital of St. John, said to have been erected by our Henry II., has an extensive Gothic hall, used as a chamber for the sick, of great width and height, with a double row of light columns supporting the roof. There are two theatres.

The traveller Bernier, and the poet and philologist Menage, were natives of Angers. In the time of its subjection to the Romans, the town was called Juliomagus and subsequently Andecavi. It is 178 miles S.W. of Paris; latitude $47^{\circ} 28' N.$, longitude $0^{\circ} 33' W.$

The arrondissement of Angers contains 59 communes and 92,810 inhabitants. Its extent is equal to 436 square miles, or 279,040 acres.

ANGERSTEIN GALLERY. [See NATIONAL GALLERY.]

ANGINA PECTORIS, literally, 'a contraction or tightening of the chest,' a disease so named from the anguish felt in the chest. This disease is characterized by a sudden attack of severe pain in the lower part of the chest, commonly inclining to the left side; the pain is sometimes so severe, that the patient feels as though he must die: the pain generally extends to the left arm, and occasionally also to the right; it is often attended with a sensation of fainting or of suffocation, and with palpitation of the heart, but frequently these latter symptoms are absent; the pulse is commonly quick, weak, irregular, or intermittent, though sometimes it is little affected; the countenance is commonly pallid, and the expression anxious and depressed. This attack comes on in paroxysms, which last from a few minutes to half an hour and more. There is no regular interval between the paroxysms, and no distinct warning of their return. They usually come quite suddenly, from slight causes, and often when no cause can be assigned. The health at first is tolerably good during the intervals, but in the progress of the disease a great variety of uneasy sensations distress the patient even when the paroxysm is absent, chiefly those which indicate a disordered state of the digestive and respiratory organs.

Much investigation has been instituted to ascertain the seat and nature of this disease; and although physicians are not yet unanimous in their opinion in regard to either, yet sufficient evidence has been accumulated to determine both with a high degree of probability. It seems upon the whole to be established that it is primitively a nervous affection, and that the nerves in fault are those which supply the lungs and heart—the lungs in consequence of the disease of its nerves being unable perfectly to decarbonize the blood, and the heart, in consequence of the disease of its nerves, not being duly nourished, and consequently not being able to carry on the circulation with the requisite energy and regularity. On inspection of the organs after death of those who perish by this disease, in the immense majority of cases appreciable disease is discoverable both in the lungs and in the heart, but more especially in the latter. The most frequent morbid appearances in the heart are ossification of the coronary arteries (the nutrient arteries of the organ); ossification of the valves of the heart; preternatural accumulation of fat on its external surface; enlargement of its cavities; and, above all, change of structure in its muscular substance, which becomes pallid, soft, flabby,

thin, and easily torn. This change in the muscular substance of the heart is by far the most constant morbid appearance; but even this, as well as the other organic changes, must be considered as the effect rather than the cause of the disease, in whatever degree these organic changes may be the cause of death.

Angina pectoris is most frequent at the meridian of life and beyond it; it may occur in adolescence, but it is very rare at that period. It is much more frequent in the male than in the female. Out of one hundred cases, seventy were upwards of fifty years of age, and seventy-nine were males. It is remarkably under the influence of mental causes, if it be not in the first instance induced by them. When it has once occurred, a paroxysm is readily produced by any emotion, whether of a pleasurable or a painful nature, but more especially by the latter. Anxiety of mind, any depressing passion, or anger, places a person subject to this disease in the most imminent danger. Many persons have died suddenly, instantaneously, under the influence of such emotions. There is conceived to be a close connexion between this disease and gout. Without doubt it is very often found in persons who are subject to gout, and the less the gout affects the extremities, in its regular and decided form, the more frequently and severely such persons suffer from angina pectoris.

It is of the nature of this disease to proceed progressively from bad to worse. At first it is a temporary evil of short duration, recurring, perhaps, only at distant intervals; but if it be neglected, the intervals become shorter and shorter, and the paroxysms more and more severe. Complete success often attends the early, active, and judicious treatment of it. This, therefore, is eminently one of those diseases, the first accession of which should excite serious alarm, and induce every one to adopt without delay, and with the greatest regularity, the means best fitted to prevent the recurrence of it.

Those means are, in the paroxysm, absolute rest. The paroxysm often comes on in walking or during some bodily exertion—the patient has the feeling that the continuance of such exertion would prove instantaneously fatal; and it is really highly dangerous. Unless in very severe cases, the paroxysm usually goes off spontaneously, in a few minutes, on sitting perfectly still, or, which is often better, on lying down. If the pain do not quietly subside, vigorous friction with a stimulating liniment should be applied over the whole chest, and the patient should instantly take some warm antispasmodic and stimulant medicine, such as two ounces of the camphor julep, with a dram of ether or of the aromatic spirit of ammonia. But much more active measures may be necessary: and this is a disease so serious in its nature, and requiring so much delicacy and skill in the management of it, that the patient ought to place himself under the best medical guidance he can procure as quickly as possible. It is during the interval that the most effectual treatment must be employed. It is impossible to discuss here the remedies which the physician should resort to, the reasons which should determine his choice, and the different states which should modify the treatment in adaptation to individual cases. But it is very important to state, that angina pectoris is one of those diseases in which the concurrence of the patient with the efforts of the physician is indispensable. Unless the patient resolve and firmly adhere to his resolution strictly to conform to the plan prescribed in diet, in exercise, in every locomotive movement, in sleep, temperature, and medicine, but above all in the regulation of the mind, the physician can do but very little for him.

ANGIOSPERMIA. [See DIDYNAMIA.]

ANGLE OF CONTINGENCE, or CONTACT, the opening made by a curve and its tangent. [See CURVATURE.]

ANGLE (CURVILINEAR), the rectilinear angle made by the tangents of two curves at the point where they meet, as ABC.

* Although there is only one institution in France designated 'university,' yet that term will convey to the English reader the best idea of what the French term an '*académie*.'

ANGLE (HORARY), the angle formed with the meridian of any place by a great circle, which passes through a star and the pole.

ANGLE OF INCIDENCE, REFLECTION, REFRACTION, ELONGATION, ELEVATION, THE VERTICAL.—see these several terms.

ANGLE, PLANE, SPHERICAL, SOLID, PARALLACTIC.—see these terms.

ANGLE OF POSITION, usually the curvilinear angle made by two great circles drawn through a star to the poles of the ecliptic and equator. It may be used to signify the angle made by lines drawn from any point under consideration to any two points which are used in determining the position of others.

ANGLE (RECTILINEAR), from the Latin word *angulus*, of the same signification. The notion (for it can hardly be called definition) is the *opening* made by two straight lines which cut one another. The term *inclination* is also used synonymously with angle: thus, the angle or opening of two lines is called their inclination to one another.

To investigate a more precise definition for this word, we must recollect that any species of relation is entitled to the term *magnitude*, and becomes the object of arithmetic or geometry, so soon as it can be shown that the notion implied in one or other of the words equal, greater, or less, is always derivable from the consideration of two such relations. Take the two angles or openings made at the points A and B by the straight lines A P and A Q at A, and by B R and B S at B, and transfer the first figure to the second, so that the point A shall fall upon B, and the straight line A Q upon B S; or rather, let as much of A Q as is equal to B S fall upon B S, and let the remainder of A Q form a continuation of B S; also let A P and B R be made to lie upon the same

side of B S. We have now no longer any control over the position of A P with respect to A Q, since the first figure is not to undergo any change except that of simple removal into another position. If after A Q has been placed upon B S, A P then fall upon B R, the two openings or angles at A and B are the same. If A P, in its new position, fall between B S and B R, the opening or angle at A is less than that at B; and if A P fall further from B S than B R does, the angle at A is greater than that at B. The angle at A is called the angle P A Q, and that at B, the angle R B S. Hence the notion of one angle being twice or three times, &c., as great as another may be fixed. For example, the angle

M A P being made up of the two M A N and N A P, each of which is equal to the angle D B C, is twice D B C; the angle Q A M is three times D B C; R A M is four times D B C; and so on. Similarly, the angle D B C is one-half of P A M, one-third of Q A M, &c. The angle made by two lines does not depend upon the length of these lines: if a part D E be cut off from B D, the angle is not altered, that is, the angle E B C is the same as D B C. If B e and B d be respectively equal to B E and B D, and if B C e d turn round B, the same quantity of turning which brings B e into the position E E, will bring B d into that of B D.

When we cast our eyes on two angles, the sides containing which are nearly equal in both, we judge of their comparative magnitude by the spaces which are included between the lines. But this is not a notion capable of being rendered rigorous, because one boundary of the space is indefinite. Nevertheless we may correct this method of judging, and produce a precise idea of an angle, if we admit the propriety of comparing with one another spaces which are absolutely infinite in extent. The longer the lines are, the more nearly is the preceding notion absolutely correct, because the space

at and near the mouth of the angle, which for want of a definite boundary is doubtful as to whether it is or is not to be considered a part of the angular opening, becomes less and less with respect to that about which there is no doubt. If then we suppose the lines which contain the angle to be produced without end, the infinite spaces so imagined will be correctly in the same proportion to one another as the angles. The objection to introducing this into geometry is the real or supposed want of rigour in the comparison of unbounded spaces. [See INFINITE.] It must be remarked, however, that the disputed theory of parallels follows immediately and rigorously from the preceding, (see *Library of Useful Knowledge, Study of Mathematics*, pp. 77, 78; and Lacroix, *Éléments de Géométrie*, p. 23, note,) and it is therefore in the choice of every person to decide for himself whether he will add the words in italics to the first of the two following axioms, and prove the second, or omit the words in italics, and assume the second.

1. Two spaces, whether of finite or infinite extent, are equal when the one can be placed upon the other, so that the two shall coincide in all their parts.

2. Through a given point, not more than one parallel can be drawn to a given straight line.

In order to bound the preceding spaces, and compare angles by means of spaces or lines, it is necessary to draw arcs of circles having equal radii through the two points.

Let P Q and R S be arcs of circles having the equal radii

A Q, B S. Then the angles P A Q and R B S are in the same proportion as the spaces (called *sectors*) P A Q, and R B S, and also as the lengths of the arcs P Q and R S. This proposition, which is Euclid, vi. 33, is not so far from first principles as its position would appear to indicate. For the fifth book, on proportion, is entirely independent of, and might be considered as antecedent to, the first four books: if this were supposed, the preceding proposition might be easily made to follow book i. 23, or even i. 8. We might even place it immediately after the doctrine of proportion, by a proof founded on simple superposition, provided we assume (what is tacitly assumed in various parts of the first book of the elements, i. 4, for example) that an angle may be conceived equal to another angle before we know how to construct equal angles.

If a line setting out from A B be conceived to revolve round the point A, it will in every position form two openings or angles with its original position A B. For example, in the position A C, A B and A C will form the smaller angle B A C, and the larger angle made up of the angles C A F, F A K, and K A B. Only the former of these is usually considered in geometry, but the latter is

frequently used in analysis. When half a revolution has been made, and A B has come to A F, at first sight we might say there was no angle formed; but on looking at the preceding position A E, we see that the opening of B A and A F is greater than that of B A and A E. The half of this opening B A F, that is, B A D, is called a right angle. A whole revolution makes A B pass through four right angles, and, in analysis, if we wish to point out that the line A C is supposed to have made a complete revolution, and to have come into the position B A C for the second time, the angle made with A B is said to be

4 right angles + B A C

An angle is said to be *obtuse* when it is greater than one right angle, and less than two, and *acute* when it is less than one right angle.

For the most important properties of angles see TRIANGLE, PARALLEL, POLYGON, TRIGONOMETRY.

The methods of measuring an angle, of which we think it

necessary to take notice, are three in number. The first is the one universally employed in *theoretical investigations*, and is as follows:—in the last figure but one, the number which expresses what proportion the arc P Q is of the radius, is the number chosen to represent the angle. It is shown in geometry that if any number of arcs be drawn with the centre A, subtending the same angle P A Q, what part soever any one of them is of its radius, the same part is any other of its radius. That is, whatever circle may be chosen, the preceding measure gives the same number for the same angle. For example, if the arc P Q be equal to the radius, the angle P A Q is the angle 1. If P Q be two-thirds of the radius the angle P A Q is the angle $\frac{2}{3}$. The unit of this measure is therefore the angle whose arc is equal in length to its radius. It is customary to say that an angle or arc (for the terms are frequently confounded) thus measured, is given in parts of the radius: but this expression does not convey much meaning, and we cannot propose any better, unless it might be judged proper to say it is measured in *theoretical units*, meaning thereby in the units which are always employed in pure theory. The *theoretical unit* would then be the angle subtended by the arc which is equal to its radius.

The semi-circumference of a circle contains its radius

314159, 26535, 89793, 23816

times, very nearly. This is then the number of theoretical units contained in two right angles. The right angle is therefore

157079, 63267, 91896, 61923

and the following are the angles of one degree, one minute, and one second, to which we shall presently come:

°01715, 32925, 19913, 29577 degree
°00029, 08882, 08665, 72160 minute
°00000, 18181, 36811, 09536 second.

In the second measure, in which angles are said to be measured in *space* (the word space being here opposed to *time*, as we shall see, and not to *length*.) the whole angle traced out in one revolution, equal to four right angles, is divided into 360 equal parts, each of which is called one *degree* and marked thus ($^{\circ}$). Each degree is divided into 60 equal parts, each called one *minute* ($'$), and each minute into 60 equal parts, each called one *second* ($''$). Formerly, the second was divided into 60 equal parts called *thirds*, and so on, but it is now usual to use the tenths, hundredths, &c., of seconds. The present table therefore stands thus:

A whole revolution $360^{\circ} = 21600' = 1296,000''$
A right angle $= 90^{\circ} = 5400' = 324,000''$

Degrees.	Minutes.	Seconds.
1	60	3600
	1	60

To convert an angle from *theoretical units* into *degrees, &c. of space*, observe that the last mentioned unit is

20626 $1''$ 806217096355 in seconds
3137' 746770781939 in minutes
57° 295779513082 in degrees

and multiply the number which expresses the angle in theoretical units by the one among the preceding numbers which has the same denomination as that to which the angle is to be reduced. As many decimals may be taken as shall be considered necessary. The following table, however, will be found more convenient:

	Degrees.	Minutes.	Seconds.
1	°05729578	°03137717	°020626181
2	°11459156	°06875491	°041252961
3	°17188731	°10313240	°061879112
4	°22918312	°13750987	°082505922
5	°28647890	°17188731	°103132103
6	°34377468	°20626181	°123758884
7	°40107046	°24064227	°144385364
8	°45836624	°27501974	°165011845
9	°51566202	°30939721	°185638325

EXAMPLE. What number of minutes and decimals of minutes does the angle contain which expressed in theoretical units is 17906?

From the minutes' column take out the rows opposite to 1, 7, 9, and 6: write them so that the first figure of each shall fall under its corresponding figure in 17906, and add, but take only so many out of each row as will serve to fill up the places under the first row, increasing the last figure

of each broken row by 1, when the first neglected figure is 5 or upwards.

17906

03437747
2406423
309397
2063

06155630

Place the decimal point *three* places off the unit's column for *degrees, five* for *minutes*, and *seven* for *seconds*. This gives 6155' 630, since the present calculation is made for minutes. Further to illustrate the placing of the decimal point, let the angle theoretically expressed be .096, to be turned into degrees and decimals of degrees, and afterwards to seconds and decimals of seconds.

0° 096

51566202
3437747

0 055003949

Bring down the preliminary ciphers, and *then* cut off three places, which gives 5° 5003949. Again, for the seconds

0° 096

185638325
12375888

0 019801213

Cut off *seven* places, which gives 19801'' 213

Given an arc of a circle and the radius to determine the degrees, minutes, or seconds in the angle at the centre; divide the arc by the radius, and proceed with the quotient as above.

For the converse problem, given the degrees, minutes, and seconds in an angle, to express the same in theoretical units, the following table is given:—

	Degrees.	Minutes.	Seconds.
1	°01715329	°00029089	°00000185
2	°03430659	°00058178	°00000370
3	°05135988	°00087266	°00000554
4	°06981317	°00116355	°00000739
5	°08726646	°00145444	°00000921
6	°10471976	°00174533	°00001109
7	°12217305	°00203622	°00001293
8	°13962634	°00232710	°00001479
9	°15707963	°00261799	°00001663

EXAMPLE. It is required to express in theoretical units the angle $89^{\circ} 52' 31''$. Take out the row corresponding to each figure from the column having the same denomination, taking seven places only for a unit's figure, and the whole eight places for the tens, increasing the last figure when necessary, as before: add and make seven decimal places.

For 86° 13962634
.. 9° 1570796
.. $50'$ 0°0145444
.. $2''$ 00005818
.. $30''$ 0°0001454
.. $4''$ 00000194

15686310

and the answer is 15686340.

Given any angle, and a radius, required the circular arc subtended by that angle: proceed as above and then multiply by the radius. Thus to a radius of 100 feet, the arc which subtends an angle of $89^{\circ} 52' 31''$ is

15686340 \times 100 or 15686340 feet.

In the attempt to effect a universal change of weights and measures, which followed the French Revolution, the circle was divided into 100 degrees, each degree into 100 minutes, each minute into 100 seconds, and so on. This innovation obtained only a partial introduction, and is now almost entirely abandoned. When used, it is customary in this country to distinguish the French degrees by the name of *grades*, and to denote one grade by 1° or 1^{g} . The convenience of this method, from its close affinity with the decimal system, is certainly great: for example, grades and decimals of grades, such as $128^{\text{g}} 1329$ are converted into grades, minutes, and seconds, by mere separation of the figures: thus, $128^{\text{g}} 13' 29''$.

It is not necessary to give complete tables of reduction from the new French to the ancient system, as they would so seldom be useful; the following is all that is necessary—

1 ^h	is	0° 9	or	54'	or	3240"
1'	"	0 009	"	0' 54	"	324"
1"	"	0 00009	"	0' 0054	"	0" 324

The third method of measuring angles, in which they are said to be measured in *time*, is confined to astronomy, and is derived from the complete apparent revolution of the heavens which takes place in 24 hours. That is, if a line revolve round a point at the rate of a whole revolution in 24 hours, or a right angle in 6 hours, the times of moving through different angles are made the measures of their comparative magnitudes. Thus 4^h 32^m 60^s is the angle moved through in 4 hours, 32 minutes, and 60 seconds. The following tables are useful in turning angles measured in degrees, &c., of space into the corresponding measures in time; and the converse.

TIME INTO SPACE.				SPACE INTO TIME.			
Hours.	°	Min.	Sec.	°	h.	m.	s.
1	15	1	0 15	1	0	4	1 0 067
2	30	2	0 30	2	0	8	2 0 133
3	45	3	0 45	3	0	12	3 0 200
4	60	4	1 0	4	0	16	4 0 267
5	75	5	1 15	5	0	20	5 0 333
6	90	6	1 30	6	0	24	6 0 400
7	105	7	1 45	7	0	28	7 0 467
8	120	8	2 0	8	0	32	8 0 533
9	135	9	2 15	9	0	36	9 0 600
10	150	10	2 30	10	0	40	10 0 667
11	165	11	2 45	11	0	44	11 0 733
12	180	12	3 0	12	0	48	12 0 800
13	195	13	3 15	13	0	52	13 0 867
&c.	&c.	50	12 30	50	3	20	3 333
				60	4	0	
				70	5	20	
				80	6	40	
				90	7	0	
				100	8	40	
				200	13	20	
				300	20	0	

In these tables, where there are two headings, either the upper or under of both must be used. The following are examples.

To turn 18^h 11^m 35^s 3 into degrees, &c., of space. From the first table,

18 ^h	is	150°	0'	0"
11 ^m	"	120	0	0
35 ^s	"	2	30	0
3	"	15	0	
30 ^s	"	7	30	
5	"	1	15	
0 ^s 3	"	4	5	

18^h 11^m 35^s 3 is 272° 53' 49" 5

To turn 97° 54' 23" into hours, &c. From the second table,

90°	is	6 ^h	0 ^m	0 ^s
7°	"	28	0	
50'	"	3	20	
4"	"	16		
20"	"	1	333	
3"	"	0	200	

97° 54' 23" is 6^h 31^m 37^s 533

In astronomy 30° is sometimes called a sign, in allusion to the arc of the ecliptic, through which one of the signs of the zodiac extends: Thus 2° 30' 4' 12" means 63° 4' 12".

ANGLE (TRISECTION OF). [See TRISECTION.]

ANGLES, or ANGLI. The earliest record of this people we find in Tacitus' book on the Germans (chap. xl.); but this author only mentions their name, states a few particu-

ars relative to their religions, and intimates that they were a branch of the Suevi. Having spoken of the Semnones as the most ancient and illustrious tribe of the Suevi, he thus continues: 'But the Langobards are ennobled by their small number; being surrounded by a multitude of the most valiant nations, they live in a state of security, not by submitting to them, but by fighting battles and braving dangers. After them follow' (in this description he is proceeding north-westward) 'the Raudigni, the Aviones, the Angli, the Varini, the Eudoses, the Suardones, and the Nuithones; all these are protected by woods and rivers. Singly, these nations present nothing that is remarkable, except that they in common worship *Hertha*, that is, Mother Earth, believe that she interferes with human affairs, and journeys in a chariot among the nations. In an island in the ocean there is a holy grove where a consecrated vehicle is kept, covered with a vest: nobody but the priest is permitted to touch it. He knows when the goddess is present in this sanctuary, and putting cows to the vehicle, he honours her with great devotion. These are days of rejoicing, and festivals are kept in whatever place the goddess visits, and honours with her presence. During these days they do not go to war, nor take arms in hand; hostile weapons are laid aside: peace and quietness only prevail, and are cultivated till the priest brings back to her temple the goddess satiated with the converse of mortals immediately thereafter the chariot and the vests, and if we choose to believe it, the goddess herself are washed in a secret lake. Slaves perform this service, who are instantly swallowed up by the lake. From this a mysterious fear arises, and a holy wonderment at what that can be which is beheld only by men who must lose their lives. This portion of the Suevi extends into those parts of Germany which are *less known*. This description at all events will convince most readers that Tacitus knew very little about these nations. Lindenbrog and Leibnitz (*Scriptor. Rerum Brunsvicens.* tom. i. p. 81) have preserved fragments of the ancient laws used in common by the Angli and the Varini. D'Anville has in his map assigned to them the same district which they occupied in the fifth century before their emigration to England, and parts of which the modern Angles still occupy. He allots to them the greatest portion of modern Schleswig and some part of Holstein, making the German ocean their western boundary, the Saxons their nearest neighbours on the south, the Varini on the south east, and the Jutes on the north. It is impossible to fix with accuracy any boundaries for the Angli from the account given by Tacitus, but his statement appears perfectly reconcilable with D'Anville's map and the Saxon Chronicle; and it is remarkable that D'Anville in every respect agrees with the last-mentioned record, although it may be doubted whether he knew it, or paid any attention to it. The difficulties raised by German critics and historians, such as Haus and Dörfer, that the Angles, if inhabiting only the district of modern *Angeln*, were too insignificant a nation to occupy Great Britain, are indeed idle: for 1st. it has never been asserted that their domain did not extend beyond the boundaries of modern *Angeln*; 2d. the numbers which Hengist and Horsa first led over to England to the assistance of Vortigern against the Pihts were not so great, as to render it impossible even for a small tract of land, inhabited by a warlike race of men, to produce them; 3d. it was never asserted that the Angles *alone* occupied England, but that soon after their first attempt the Saxons and the Jutes joined them, or co-operated with them; 4th. these critics do not sufficiently attend to the circumstance, that the occupation of England was effected as much by circumvention as by open force, and that the Angles obtained new allies in the Pihts whom they at first came to expel. It is, therefore, needless to extend the boundaries of the Angli to the Elbe and Travemünde: or even to spread them over the whole of the Cimbric Chersonesus (Modern Jutland). [See SAXONS.]

ANGLESEY, or ANGLESEA, an island in the Irish sea, on the north-west coast of Wales, in which principality it is included, and from the main land of which it is separated by the narrow strait, (or, as it is sometimes, though incorrectly, termed, river.) Menai. This strait has a direction very nearly north-east and south-west, with little variation throughout its course. It is thought that Anglesey was once united with the main by an isthmus, at a place called Pwll Ceris, where may still be traced a line of small rocks crossing the channel. It appears also that the Menai is

wider than formerly, lines of stones having been observed below the present high-water mark, which seem to have

rounded by an oak grove. In the neighbourhood are the remains of a square entrenchment, with a double rampart and moat, called *Caer-leb*, and some other relics of Druidical structures. *Caer-leb* is supposed to have been the residence of the archdruid.

[Cromlech in the Park of Plas Newydd.]

been once boundaries or fences between the sea and the land. (Rowlands's *Mona Restaurata*.) From the south-west end of this channel, the coast runs in a north-west direction to the farthest point of Holyhead Island, which is separated from the rest of Anglesey by a sandy strait, across which the Holyhead road is carried by a long embankment or causeway, in the centre of which is an opening for the water, arched over. The general direction of the coast on the north-east side of Anglesey is similar to that on the south-west side, (viz., north-west and south-east,) except near Beaumaris, where the land juts out into the sea. The remaining part of the coast from the extremity of Holyhead Island first curves inward, forming Holyhead bay, and then runs east to beyond Amlwch. The length of a line drawn from south-west to north-east, along the shore of the Menai from Aber-Menai Ferry to Trwyndŷ Point, opposite the little island of Priestholm, is 17 miles: a line drawn at right angles to the above from Carnel's Point, in the north-west, to the Menai, is about 20 miles long; and these may be taken as the breadth and length of the island. A much longer line may, however, be drawn, running nearly east and west, from the extremity of Holyhead Island to Point Trwyndŷ, mentioned above; this distance is about 27 miles. (Evans's large *Map of North Wales*, Llwynygroes, 1795.) The number of square miles of surface is variously given. The population, in 1831, was 48,300. There are several smaller islands round the coast. Holyhead, the largest of these, is at the western extremity; Priestholm, or Puffin Island*, at the eastern; the others are insignificant. This island had, in early times, the names of Ynys-Dowell, (the shady or dark island,) Ynys-Fon, (the farthestmost island,) and Ynys-y-Cedeirn (the island of heroes). By the Latin historians it is called *Mona* (which name it shared with the Isle of Man); the name of Anglesey, (Angle's ey, Englishman's Island), it received from the Saxons. It was a great seat of Druidical superstition. Suetonius Paulinus, the Roman commander, landed here (A.D. 61) in spite of the resistance of the natives, and the terrors which the Druids sought to strike into the hearts of the invaders: he cut down the sacred groves, and gave a blow to the Druidical superstition, from which it never recovered. The island was abandoned by the Romans for a time in consequence of the great revolt under Boadicea, and again conquered by Agricola A.D. 76. Several Druidical remains still exist, cromlechs (flat stones resting upon others) and *carneada* (heaps of stones): of two cromlechs in the park of Plas Newydd, the seat of the Marquis of Anglesey, the larger has its upper stone 12 feet 7 inches long, 12 feet broad, and 4 feet thick, supported by five tall stones. There is at Tre'r-Dryw, in the parish of Llanidan, a large circular inclosure 180 feet in diameter, surrounded by a mound of earth and stones evidently brought from other parts, for the bottom of the bank, within and without, is level with the ground on which it is raised (Rowlands). It is supposed to have been the seat of a Druidical consistory. Near are the remains of a cromlech and a *Gorseddau*, or heap of stones, now dispersed, and of a large circle of stones. Rowlands supposes the whole to have been sur-

Egbert, monarch of the West Saxons, conquered the island in the former part of the ninth century, but the princes of North Wales having recovered it, Aberfraw, one of its towns, became the seat of government, and continued to be so till the final subjugation of Wales. During the reign of our William II., (Rufus,) near the close of the eleventh century, Anglesey was again attacked and ravaged by the English, in retaliation for some depredations committed by the Welsh borderers. It was laid waste in the following century during the civil contests of the Welsh themselves; unsuccessfully invaded by the Irish in the time of Henry III. A.D. 1245; and finally subdued by Edward I., a detachment of whose army was cut off by an unexpected onset from the inhabitants after they had appeared to submit. It was again made the scene of contest in the struggle between Charles I. and his parliament. [See BEAUMARIS.]

The climate of Anglesey is rendered by the sea breezes milder than that of the adjoining part of Wales; snow seldom lies long, even in the depth of winter; but the air is, from the same cause, loaded with frequent mists in autumn, at which season intermittent fevers prevail. The surface of the island is comparatively flat, and the absence of wood, as well as of quickset hedges, gives it a barren appearance. The air is so unfavourable to the growth of trees, that in most parts the gentry can with difficulty raise a plantation around their own houses. There are, however, considerable woods in the neighbourhood of Beaumaris, and at Plas Newydd, the seat of the Marquis of Anglesey, on the Menai Strait. The limited extent of the island does not admit the formation of any considerable stream. Many rivulets descend from the interior, but none of them have any claim to notice. The coast forms several harbours, the principal of which are Beaumaris and Holyhead. That of Amlwch has been formed by excavating the rock. Anglesey was formerly a place of considerable trade, and the names of ports and havens yet remain, the use of which has long been given up.

The soil of the island is various: the lands on the sea-coast, especially on the western side, are sandy: the low grounds are chiefly covered with a black soil, approximating to peat earth, from which the peasantry dig turf for fuel, and in which they frequently find large trunks of trees, hard and black as ebony, buried several feet under ground. The more prevalent soil is, however, a stiffish loam, which, when manured with sand, produces abundant crops. The sand chiefly used as manure is that from the western side of Redwharf Bay, on the east coast; it has a large intermixture, amounting to two-thirds, or from that to four-fifths, of sea shells. Various kinds of marl are found in the island, but the use of these as manures has declined: lime is used abundantly. The chief agricultural productions are oats and barley; of wheat the proportion is small, and of rye still smaller. Potatoes are grown in greater quantity than in any other part of North Wales, and the cultivation of the turnip is on the increase. Pasturage is, however, the great object of the farmers' attention, for only one-eleventh of the enclosed lands is estimated to be under tillage. Cattle from

* This island takes its name from the number of the puffins which frequent it. During part of the summer it swarms with these and other birds of passage.

one of the staple productions of the island, and numerous herds are exported. These, before the erection of the bridge, were compelled to swim over the Menai strait. The yearly export is estimated at about 8000 head, but such numbers are of course liable to change. The dairy is so little regarded, that the produce of it is hardly sufficient for the consumption of the island. The Anglesey sheep are the largest native breed in North Wales; they have white faces and legs, and are generally without horns. The export is from 5000 to 7000 head annually. The export of hogs used to be considerable, but the quantity of Irish pigs brought to England has, in a great degree, caused it to be given up. The horses are in no repute. (Davies's *General View of the Agriculture of North Wales*.)

The coasts of Anglesey supply an abundance of fish; some of which are not common elsewhere. Shell-fish are abundant.

The mineral riches are also great. The Mona and Parys copper mines, on the north-east coast, began to be worked about 1762, but at first with little success; they have since produced immense wealth to the proprietors. (See AMLWCH.) Mr. Pennant supposes these mines to have been worked by the Romans, and traces of the ancient operations were perceived by him. Lead ore, rich in silver, has been found also in Parys Mountain. Limestone ranges traverse the island; marbles, both white and variegated, are procured; mill-stones are quarried at Redwharf and Penmon; and there are coal-mines at Mallaeth, but they do not appear to have been worked with much success. They are, however, remarkable in a geological point of view, because they afford the only known instance in this country of a coal formation in the slate. The coal-field is irregular and uncertain. Several unprofitable trials have been made, and occasionally coal has been worked to a considerable extent. In one pit a vein three feet and a half thick was found at a depth of only twenty-five yards. A singular phenomenon occurs in this formation: large alluvial holders of coal, some of which weigh a ton or upwards, are found scattered upon the surface. (See COAL FIELDS.) It may be observed, that Anglesey is the only part of the whole principality of Wales in which granite has been observed, and there only in a small spot near the centre. The inhabitants do not carry on any great manufacture: they buy wool at Caernarvon and Bangor fairs, and make coarse blue cloths, blankets, flannels, &c., just sufficient for their own use.

The main road to Holyhead, the usual place of embarkation for Dublin, runs through the island. It crosses the Menai Strait over a magnificent suspension-bridge, the under side of the roadway of which is about 100 feet above high-water mark, so as to admit the passage of the largest vessels which navigate the strait; and the distance from centre to centre of the pyramids of masonry from which the bridge is suspended is 580 feet, rather more than the width of the strait at low water, but considerably less than the width when the tide is up. (Provis's *Historical and Descriptive Account of the Menai Bridge*.)

The communication between the island and the main was formerly entirely by ferries, of which there were five or six; that of Porthaethwy, or Bangor, now superseded by the Menai Bridge, being the principal.

The county of Anglesey is divided into three cantrefs, a division which originated at a very early period; and these cantrefs are subdivided each into two comots (cwmwds). Of the period when the subdivision was made, there appears to be some doubt. For civil purposes, these comots are equivalent to hundreds. It is in the diocese of Bangor and in the province of Canterbury, and in the North Wales circuit.

The market towns are Beaumaris, (population in 1831, 2497,) the county town, on the south-east coast (see BRAUMARIS); Holyhead (population 4282), the great place of embarkation for Ireland, situated on an island of the same name, on the west coast (see HOLYHEAD); Llanuerch-y-Medd, on the road to Amlwch, with a market, once the most considerable in Anglesey, but of less extent since the opening of that at Llangefni; Llangefni, a few miles from the Menai Bridge, on the road to Holyhead (population 1753); Aberfraw, on the south-west coast, once the residence of the Welsh princes (population 1367); and Newborough, not far south-east of Aberfraw (population 804); but the markets of the last two seem to have come into disuse, while a customary one has grown up at Amlwch (population

6285),* a place of greater importance than either. (See AMLWCH.) Holyhead, Amlwch, and Llangefni, are now united with Beaumaris in the privilege of returning a member to parliament; and the county returns another. The county election and that for the united boroughs are both held at Beaumaris; and the poll for the county is taken at Beaumaris, Holyhead, and Llangefni.

The chief gentlemen's seats are Plas Newydd, on the Menai, the seat of the Marquis of Anglesea; and Baron Hill, near Beaumaris, the seat of Sir R. B. Williams Bulkeley, Bart. There are few antiquities except Druidical, the chief of which have been noticed above. Beaumaris castle will be noticed in the article BRAUMARIS; there are also the remains of a priory at Llanvaes, and of another at Penmon, both in the same neighbourhood. The conventual church of the latter is used as the parish church. An agricultural society was established in the island in 1808. The measures in use here differ from the common ones; the acre of land is about two-thirds of the statute acre, and the yard of cloth contains forty inches. (Rowlands's *Mona Antiqua Restaurata*; Pennant's and Bingley's *Tours in North Wales*; Davies's *Gen. View of the Agric. of North Wales*.)

ANGLO-SAXONS. [See SAXONS.]

ANGO'LA, a country on the west coast of Africa. According to M. Degrandpré, a French officer of marine, whose *Voyage à la Côte Occidentale d'Afrique, fait dans les années 1786 et 1787*, appeared at Paris in two volumes, 8vo., in 1801, the name is often used to comprehend the whole extent of coast from Cape Lopez Gonsalvo in lat. 0° 44' S. to S. Felipe de Benguela, in 12° 14' S. The whole of this space appears to be considered as one country by the natives; but by them it is called, not Angola, but Congo, and is divided into the separate districts of Loango, Congo Proper, Angola, and Benguela. The country properly called Angola commences only about lat. 6° 20' S., where it is divided by the river Danda from Congo, and is bounded on the south by the river Coanza, in lat. 9° 20' S. The country immediately to the south of the Coanza is commonly considered to be part of Benguela, although that name appears to be sometimes used as applicable only to the country to the south of the river Catumbela, immediately above S. Felipe de Benguela, at most to that south from the river Longa in lat. 11°. Anciently, Benguela, which afterwards became a separate kingdom, is said to have formed one of the provinces of Angola, and to have extended as far south as to Cape Negro, in lat. 16° S. This is the account given by Father J. A. Cavazzi de Monto Cuculo, a Jesuit, who resided in Angola for many years as a missionary, and whose description of the country may be found in Labat's *Relation Historique de l'Ethiopie Occidentale*, 5 vols., 12mo., Paris, 1732. The proper name of Angola is said to be Dougo-Angola; and Dougo is the abbreviation most in use among the natives, or at least among those on the coast.

The coast of Angola was first discovered by the Portuguese navigator, Diego Cam, in 1486. Very soon after this the Portuguese began to form settlements both along the banks of the Zaire, and at various points of the coast to the south of that river. It was not, however, till 1578 that the town of Loando San Paolo, commonly called St. Paul de Loando, the capital of Angola, was begun to be built. Since then, the Portuguese governor has resided here, and has been called governor of Angola, instead of governor of Congo, as formerly. In 1640, the Portuguese were driven from St. Paul by the Dutch, who retained possession of the place till 1648, when it was recovered by its former masters. It has ever since remained in the hands of Portugal.

Mr. Bowdich, in his *Account of the Discoveries of the Portuguese in the Interior of Angola and Mozambique*, states, on information derived from Count Saldanha de Gama, who had been governor-general of Angola, that the Portuguese settlements extend into the interior for about seven hundred miles from that coast. It is not to be understood, however, that the whole of this territory is, in any sense, under the dominion of the crown of Portugal. It only possesses a few forts, and some commercial establishments, called *Féiras*, or fairs, at great distances from each other. Two of the fairs are seven hundred miles inland, and are under the superintendence of a Portuguese resident. The Portuguese colonists and the natives meet at these stations for the pur-

* The population given is that of the parishes. These are often more extensive than the towns; that of Amlwch contains part of the town of Llanuerch-y-Medd, which is in different parishes.

poses of exchange. In one of Mr. Bowdich's maps; Cahenda, which is called the most distant of these fairs, is placed between the 18th and 19th meridians; but in another, two fairs are set down near each other, in about long. 22° E. Cahenda is on the south bank of the river Manibella, which appears to be the origin of the Bonga. There is, or was, a capuchin mission here. Lower down the river is Bangoa Quitamba, in long. 17°, where a carmelite mission is stated to have been established. The forts in the interior of Angola, laid down in Mr. Bowdich's map,—which was constructed in 1790, partly from personal inspection, by Lieutenant-colonel Furtado, an officer of engineers,—are Fort Massangano, at the junction of the river Lucala with the Coanza, about long. 16° 15' E. from Greenwich; Fort Cambambe, higher up the Coanza; Pungo Antlongo, at the junction of the Gaugo, or Moeonga, which flows from the south, with the Coanza, a little beyond the 18th meridian; Fort Pedras, in the same vicinity, but not on the river; and Fort Ambaca on the Lucala, about long. 17° 35'. At Massangano there is a garrison of a hundred infantry, and one of sixty at each of the other forts, formed of natives, but commanded by Portuguese officers.

The force kept up at Loando, according to Count Saldanha, is always composed of one regiment of the line, a thousand strong, three hundred cavalry, and two hundred artillery. Descriptions of this town may be found in a *Voyage to Congo made in the Years 1666 and 1667*, by the fathers Angelo and Carli, and in Merolla's *Voyage to Congo in 1682*. Translations of both are printed in the 16th volume of Pinkerton's *Voyages*, and also in Churchill's *Collection*. The city, which in Mr. Bowdich's map is placed in lat. 8° 45' S., is built partly on the mainland, and partly on the Island of Loando, which lies about a mile from the shore, and according to Merolla is ten leagues in length. Bowdich says, that it varies from one hundred to three hundred yards in breadth. St. Paul de Loando was formerly celebrated for the magnificence of its churches and other ecclesiastical buildings. Cavazzi speaks of it as being surrounded, instead of bastions, by temples and monasteries. Besides a cathedral, it contained in those days a convent, an hospital, and a Jesuit's college of great extent. It was formerly the seat of a bishopric; but the bishop, Count Saldanha thought, had taken up his residence in one of the Azores. Both Captain Owen, in H. M. S. the *Leven*, and Captain Vidal, in the *Barracouta*, touched here in 1825, in the course of their survey of the African coast. Captain Vidal, sailing towards the north, arrived off St. Paul, on the afternoon of the 8th of November, when guns were fired at the ship from a large battery hewn in a rocky cliff, and presenting a double tier of artillery. The *Leven* arrived on the 6th of December, and both ships remained till the 19th of that month. The present town is described as situated considerably to the north of the ancient town and port, the former of which is in ruins, and the latter blocked up. The churches and other public buildings were found to be in a state of great decay, and the garrison is stated to consist of only six hundred men. The soldiers are said to be mostly convicts. Mention is made, however, in another place, of a respectable corps of cavalry, which, perhaps, is not included in the number just quoted. The principal part of the city stands on an eminence, which juts out towards the island, and on the extremity of which the largest citadel is placed. There are two other batteries besides this. The low-lying part of the town, however, is the most crowded. It is inhabited, for the most part, by the negroes of the country, and consists merely of a crowd of mean hovels. Bowdich states the whole population of St. Paul at 8000. The entire length of the town is described, in Captain Owen's *Voyage*, as extending for about a mile and three-quarters along the shore. The new harbour is three miles and a half long, and deep and commodious. The market was found to be well supplied with fruit and vegetables, and bullocks and goats were also in great plenty. The country around is described as dusty and parched; but the town is well supplied with excellent water brought daily in tank-boats from the river Benga, which flows into the sea some miles to the north of St. Paul. The old accounts say that plenty of good water is found by digging in the Isle of Loando. This vicinity, according to the account in Captain Owen's *Voyage*, is the only part of the west coast of Africa, to the south of the Gambia, where horses will thrive.

The most detailed account that has been given of the geo-

graphy of Angola is that furnished in Labat's book, principally from the work of Father Cavazzi. But of the seventeen provinces, into which he describes the country as having been antiently divided, only the following seven belong to what is properly called Angola:—Loando, that in which the capital is situated; Danda, adjacent to the river of the same name, described as abounding in corn, fruit, and venison; Benga, on the banks of the Benga, (otherwise called the Zenza,) and altogether inland; Mosecho, between the Lucala and the Coanza, being the province in which the two forts of Massangano, and Cambambe are situated; Ilamba, between the Danda and the Benga, divided into the lower province next the sea, and the higher, called otherwise Lumbio, farther inland; Oarii, to the east of the former, and Embacca, or Membacca, comprehending the upper region of the Lucala, being the province in which the fort called Ambaca by Mr. Bowdich is situated. Various additional particulars may also be collected from Mr. Bowdich's book. Nearly five hundred miles beyond the most distant Portuguese fair is Cassange, where it is stated that, during the government of Count Saldanha, a respectable merchant of the name of Da Costa, who had at one time commanded the militia in the interior, established himself, and lived many years in perfect harmony with the natives. To the north of the Cassanges are the Cachingas, and to the east of them are the Domges, with whom they are always at war, and who are said to maintain a trading connexion with the Portuguese settlement of Mombaca, on the opposite coast of the continent. The natives say, that the Congo and the Coanza have both their source in a great lake, which lies on the eastern limits of Cassange; and also, that there is in that region a third river larger than either of these, which they call the Casati. The Coanza, it appears, has been actually traced by the people of the country to the distance of fifteen days' journey beyond the Quindonga islands, in long. 20° 30', through the territories of the Mogan-guelas and Songhos, two dependencies of Cassange. The islands of Quindonga in the river were taken possession of by a Portuguese force during the government of Count Saldanha. The district in which they lie is called Mattemba, and is to the east of Upper Ilamba, already mentioned. In this neighbourhood, according to some authorities, are the Giagas, or Jagas, whose atrocities make a great figure in all the old accounts. But Mr. Bowdich says that Jaga is an epithet which is borne by the Cassanges, and that it denotes a race who were originally nomadic warriors, in contradistinction to Jova, which means a stationary people. The Giagas mentioned by the old writers certainly resided far to the west of Cassange. To the north of Mattemba, and separated from it by the Lunini, a branch of the Congo, is the district of Ginga, the ancient capital of which, Cabasa, is reported by the natives to be four days' journey north of the Coanza, and three days' journey south of the Congo. It is placed in Mr. Bowdich's map, nearly in 8° S. lat., and on the same meridian with the Quindonga islands. It is necessary to observe, however, that very little dependence is to be placed upon these notices, the very vagueness of which indicates that they have been in great part derived from nothing better than the loosest rumours, while a comparison of the accounts given by different authorities would show them to abound in contradictions and inconsistencies. Both Cavazzi and Father Canneattini, who resided for some time in Angola as a missionary, and wrote a Grammar and Dictionary of the language of the country, published at Lisbon in 1804 and 1805, make the Giagas to be the people of Mattemba, or Matamba, and to have been so called from one of their queens, Gingha, or Anne Zingha, or Gongo Amena, the history of whose wars with the Portuguese, in the seventeenth century, occupies a large space in Cavazzi's narrative.

The language spoken throughout the whole of Angola Proper is the Bunda, which appears to be merely a dialect of the Congoese, or that spoken as far north as Cape Catharin. It is reported by tradition to have originated in Cassange, and to have been introduced into the parts nearer the coast by conquest. A Grammar and Dictionary of this tongue have been compiled, as we have mentioned above, by Father Canneattini; and some account of its peculiarities is given by Mr. Bowdich from these works. The most important which he notices are that the singular and plural of the nouns, the voices, tenses, and persons of the verbs are distinguished by prefixes, and the article varies in case and number with the noun. A language

nearly the same appears to be spoken as far east and south as Mooloa, in 19° S. lat. and 32° E. long.; and it is probably not so entirely different from that used in Benguela as Mr. Bowdich asserts. In the account which he gives of the journey made through that country by Gregorio Mendez in 1785, it is stated that at Bumbo, in 14° 40' S. lat. and 14° 45' E. long. the jargon spoken by the natives was found to be easily intelligible to those who understood the Bunda language.

The government, laws, and religion prevailing among the natives of Angola are, in their general features, the same with those of the other negro tribes of Africa. The supreme authority in each district is in the hands of a single ruler, who is subject to no regular control. A tax is levied by the Portuguese from the inhabitants of Loando, and of the other small districts where they have erected forts. Ample details respecting the native superstitions may be found in Labat's volumes. In the course of the sixteenth century various missions were sent out by successive popes with the object of diffusing the knowledge of Christianity among the inhabitants of this part of Africa; and by dint of force as well as of persuasion, a good many converts were made. There is reason to believe, however, that the number of negro Christians in Angola is now very inconsiderable. The most enduring labours of the pious and intrepid missionaries are the accounts which several of them have given to the world of the country which their zeal induced them to visit.

The writer who, in recent times, has professed to give the fullest account of the climate and natural productions of Angola, is M. Degrandpré. But his statements really do not refer to Angola, properly so called, at all, but to Congo; the most southerly port which he had visited being Ambriz, which is only in 7° 20' S. lat., about a whole degree distant from the confines of Angola. This, he says, was the nearest port to St. Paul at which the Portuguese would suffer foreign ships to touch. From other authorities it appears that the country, though hilly, is not so much so as a great part of Benguela. Cavazzi describes the confines next Congo as defended by high mountains and sandy deserts. There are no considerable mountains, however, in the space between the Danda and the Coanza until you proceed up the country as far as to the higher Ilamba. The hills then rise beyond each other in successive terraces. The rivers, with the exception of the principal branch of the Coanza, all appear to originate in this district, or in those farther to the east. Most of them have been already mentioned, and they all fall into the sea either by the Danda, the Benga, or the Coanza. In the higher Ilamba, Cavazzi states, are iron-mines, being the same, we suppose, which are mentioned by Mr. Bowdich as having first begun to be wrought in 1770, but as having been soon after abandoned, on account of the inconvenience occasioned by the frequent inundations of the river Lucala. The attempt to work them, however, was resumed, under the direction of Count Saldanha, with more success, a hundred and fifty bars of iron being brought monthly from these mines to St. Paul, besides what was disposed of in the interior. In other parts gold dust is said to have been formerly found; but Mr. Bowdich states that there is none now. Mines of copper are said to exist somewhere in the interior; but what the Cassanges sell to the Portuguese comes from Mooloa, which, as already mentioned, is far to the south of Angola. Petroleum is found in abundance in the province of Danda.

The rains are stated to be so irregular, that sometimes there are none for three years. On the other hand, there is occasionally a heavy rain which lasts for many days.

The principal commerce of Angola is carried on with Brazil, to which country many thousands of slaves have for a long period been annually exported. Mr. Bowdich has printed some accounts relating to the trade between Angola and Lisbon during the years 1803 and 1804, from which it appears that the only imports into Lisbon from Angola were, in the former year, 289 quintals of ivory, valued at 2,336,000 reis, and in the latter 750½ quintals, valued at 4,779,000 reis. The exports to Angola from Lisbon are stated as consisting of wine, brandy, oil, pork, and other provisions; silks, linens, cottons, flannels and other woollens; hats, glass, gold and silver ornaments, earthenware, hardware, muskets, drugs, paper, and sundry other articles, such as might be supposed to be required for the use of the colonists, to the amount (including some imports from Asia) of 480,789,312 reis in 1803, and of 586,978,145 reis in 1804. These two

sums would amount severally in English money to about 130,000*l.* and 160,000*l.* Such a consumption of foreign commodities would not indicate either a large population of European colonists, or an extensive demand for such foreign productions by the natives; but it is probable that there were also some imports from Brazil.

The physical geography of this portion of Africa, and of the adjacent regions, will be treated of under the head of Congo.

ANGO'RA. [See ANCYRA.]

ANGOSTU'RA, a town in South America, on the banks of the Orinoco, in the Republic of Colombia, at a distance of about 240 miles from the mouth of the river, in 8° 8' 11" N. lat., and 63° 55' 21" W. long. The town is built on the southern bank at a place where the bed of the river is narrowed on both sides by rocks, and to this circumstance it owes its usual name, signifying the *Strait*; its proper name is *Santo Tomé de la Nueva Guayana*.

The town lies between the foot of a hill and the river, and the houses stand partly on the bare rock; they are, in general, lofty, agreeable, and the greater part built of stone. On the tops are terraces, where people sleep in the season of the greatest heat, without receiving from the dew any injury to their health or sight. The streets are regular, and for the most part parallel to the course of the river. In 1807, Angostura had a population of about 8500 persons, among whom were 300 negroes. At present it is said not to exceed 3000.

Opposite to the town, on the left bank of the river, there is a fort, called *San Rafael*, which is surrounded by a number of houses. This place connects the parts of South America north of the river with Angostura. In the middle of the river, between both places, is a rocky island, called from its situation *Del Medio*, (the middle,) which sometimes, though rarely, is under water during floods. To the southwest of the town, but contiguous to it, is another fort, called *San Gabriel*. The narrowest part of the river lies between the two forts, and here its breadth was found by Baron Humboldt to be 2130 English feet; opposite the town it was 3134 feet. When the waters are high, the river inundates the keys, and it has happened that careless people have become the prey of alligators even in the streets.

Though at so great a distance from the ocean, the town is only about 191 feet above the level of the sea. To the east of it as far as the mouth of the river, a level plain extends; but still more extensive are the plains on the west, which stretch up to the base of the Cordilleras, near Pamplona and Santa Fe de Bogotá. The western plains are known by the name of *Llanos* (levels). In the rainy season, from April till November, these plains are mostly inundated. Notwithstanding its trifling elevation above the level of the sea, and its tropical situation, Angostura enjoys a mild and equal temperature. It seldom happens that Fahrenheit's thermometer rises above 86° in the hottest time of the year; and from the beginning of November to the end of April, it rarely attains 77° during the day, and generally descends only to 69° or 70° at night. This is, in part, to be attributed to the trade-winds, which, according to Depons, blow very regularly from the month of November to the month of May; this, we believe, is a single instance where these winds extend to such a distance from the sea, and are not broken when they reach the land. The low coast at the outlet of the river, and the level plain between the sea and the town is, doubtless, the cause of this phenomenon. In the remainder of the year, the tradewinds are interrupted by calms, more or less frequent and long. Earthquakes have not occurred; sometimes a wind blows with the violence of a hurricane; but it does not last long, and terminates in rain.

The trade of Angostura, though at present nearly annihilated by the disturbed state of the country, will probably revive and become very great; before the beginning of the civil wars it was considerable. In this respect it is very advantageously situated. The channel between the town and the island *Del Medio* has 200 feet of water, when low, and on the increase of the river 50 or 60 feet more. But large vessels cannot sail up to the town on account of the shoals, which are very frequent in the lower part of the Orinoco. only such as do not draw more than eight feet can navigate it with ease. The best vessels require fifteen days to sail from its mouths to Angostura; but otherwise the mouths of the Orinoco have an advantage over every other part of Colombia. A voyage from Europe to *Punta Barima* (at

the southern embouchure) is performed sometimes in eighteen or twenty days, and the return to Europe takes from thirty to thirty-six days; besides, as the mouths of the river are placed to the windward of all the islands, the vessels of Angostura can maintain a more advantageous intercourse with the West Indies, and especially with Trinidad, than either La Guayra or Porto Cabello.

The inland trade of Angostura extends to a great distance to the west: the numerous large rivers which run from the eastern declivity of the Cordilleras to the Orinoco are navigable up to the foot of the mountain-range, and facilitate the transport of every sort of commodities: thus, the produce of the rich country about Varinas is not conveyed to the northern coast, which, though not very distant, is separated by a high range of mountains, but it descends the Orinoco and its tributaries, though the sea in this direction is more than four times as distant. The trade of Angostura with the country round Varinas was very active, and the town received from it considerable quantities of cacao, indigo, cotton, and sugar. It sent back the produce of the manufacturing industry of Europe. Humboldt saw long-boats depart from Angostura for Varinas, the cargoes of which were valued at eight or ten thousand Spanish dollars. These boats went first up the Orinoco to Cabruta at the mouth of the river Apure; then along the latter river to San Vincente, and hence on the river Rio Santo Domingo as far as Torunon, which is the port of Varinas Nuevas. The little town of San Fernando de Apure is the magazine of this river trade, which doubtless will become very considerable as soon as tranquillity is completely established in the republic. Many of the other rivers falling into the Orinoco will in future send similar commodities to Angostura, but the country on their banks is as yet uncultivated, and occupied only by savage nations. The Llanos themselves, though they are not cultivated, nor probably fit for cultivation, afford some very valuable articles of commerce. For the greatest part of the year they are covered with a fine rich grass, and innumerable herds of cattle, horses, and mules pasture on them. Great numbers of them were annually exported from Angostura to Trinidad and the other islands of the West Indies. The hides, also, and jerked meat form a considerable article of commerce. (*Travels of Baron Humboldt and Depons.*)

ANGOULEME, a city of France, on the left bank of the river Charente, and on the road from Paris to Bordeaux, 287 miles from the capital. It rises on a hill projecting into the valley of the Charente, from the heights which bound it. The air is pure, and the prospect from the ramparts, which have been changed into public walks, is extensive and fine.

The houses in the older parts are ill-built, and the streets narrow; but the 'Quartier Neuf' is much better in these respects. Among the principal buildings are the cathedral, the bridge over the Charente, and the obelisk raised by the late (Bourbon) government to the Dauphiness, whose husband took the title of duke from the town.

The chief manufactures are of paper, which is in good repute, woollen stuffs, and earthenware, coarse and fine: there are also distilleries and sugar works. To these productions of industry, some authorities add linens, copper utensils, and white wax.

It was formerly the capital of the province of Angoumois, but now of the department of Charente. It is also the seat of a bishop, whose see includes the department in which the town is situated, and who is a suffragan of the archbishop of Bordeaux. Before the revolution, it contained ten convents and two abbeys. In one of the last was the burial place of the former counts of Angoulême. It now has a royal naval school, a high school, a library, and a museum of natural history. Population 15,306.

An English traveller, Colonel Keatinge, who visited Angoulême in 1814, describes it as the Chester of France: the ancient houses on the banks of the Charente, a smoothly-flowing river, form a picturesque mass of buildings. Its beauty, however, appears to diminish on a nearer approach, when the bad construction of the place becomes more obvious.

It is a town of great and, indeed, unknown antiquity. It was the Iculisma of the Romans, and its ancient designation may be readily traced in its present one. In the ninth century, it was ruined by the Normans, and twice taken by the Huguenots in the sixteenth century.

Among the more eminent natives of Angoulême were Balzac, and Montalembert, the engineer. Two others have

acquired celebrity by crimes arising from the fierce religious contentions which agitated France in the sixteenth century;—Poltrot and Ravaillac, the assassins of the Duke of Guise and of Henry IV., respectively. (*Malte Brun; Balbi; Dictionnaire Universelle de la France.*)

The arrondissement of Angoulême contains 114 communes, and about 119,000 inhabitants.

ANGOT, a province of Abyssinia. [See AMHARA, ALVAREZ, and the travels of Alvarez.]

ANGOULEME (CHARLES DE VALOIS, DUKE OF), the natural son of Charles IX. of France and Marie Touchet, was born on the 28th of April, 1573, about a year before the death of his father. Being educated for the church, he was, at the age of fourteen, made abbot of Chaise Dieu, and two years after grand prior of France, that is, head of the order of the Hospitaliers of St. John of Jerusalem, or Knights of Malta, in that kingdom. This same year, however, having received by the bequest of Catherine de' Medici the earldoms of Auvergne and Lauraguais, he relinquished his ecclesiastical condition; and henceforth he appears chiefly in a military character. He was one of the first to give in his allegiance to Henry IV., in whose cause he fought with distinguished gallantry, at Arques, at Ivry, and at Fontaine Franoise. After the termination of the war, however, he is charged with having been concerned both in the conspiracy of the Marshal de Biron in 1602, and in that fomented in 1604 by the Marchioness de Verneuil, Henry's mistress, who was Angoulême's half-sister, being a daughter of Marie Touchet. For his share in the first of these attempts he was sent to the Bastille, but was soon set at liberty; on the next occasion sentence of death was passed on him, but the punishment was commuted by his royal master into perpetual imprisonment. In 1606, the possessions which had been left him by Catherine de' Medici were taken from him by a decree of the parliament, and bestowed upon the Dauphin, afterwards Louis XIII. In 1616, however, he was released by that king from his long imprisonment; and in 1619 he was made Duke of Angoulême, having till then borne the title of Count of Auvergne. He was also appointed general of the light dragoons of France, and in 1620 was sent on a special embassy to the court of the Emperor Ferdinand II. He afterwards resumed his military career. It was he who in August, 1628, commenced the famous siege of Rochelle, where the Huguenots held out against the royal forces, till they were obliged to surrender after an obstinate defence of nine months. After this he served for some years in Languedoc, Germany, and Flanders, in the war against the house of Austria which occupied the last years of Louis XIII. and the commencement of the reign of his successor. He died at Paris on the 24th of September, 1650. The following works by the Duke of Angoulême were published during his life: *Les Harangues prononcées en l'Assemblée des M.M. les Princes Protestants d'Allemagne*, par le Duc d'Angoulême, octavo, 1620; *La Générale et Fidèle Relation de tout ce qui s'est passé en l'île de Ré, envoyée par la roi à la reine sa mère*, octavo, 1627; and *Relation de l'Origine et Succès des Scherifs, et de l'état des royaumes de Maroc, de Fez, et de Tamlant, écrit en Espagnol par Diego de Torrès, et traduit par M. C. D. V. D'A.* (M. Charles de Valois d'Angoulême,) quarto, Paris, 1636. The last is reprinted in the third volume of Ablancourt's translation of Marmol Caravajal's *Description of Africa*, three volumes, quarto, Paris, 1667. The *Mémoires très particuliers du Duc d'Angoulême* were published at Paris in duodecimo, in 1667, by Jacques Bineau, along with some other narratives relating to the same period of French history. The volume was reprinted in 1696; and the Duke's memoirs are also to be found both in the first volume of the *Mémoires particuliers pour servir à l'Histoire de France*, four volumes, duodecimo, 1756, and in the third volume of the *Pièces Fugitives*, published by the Marquis d'Aubais and M. Menard, in three volumes quarto, in 1759. In 1667 an account of the Duke's embassy to Ferdinand II. was published at Paris in a folio volume, by Henry Comte de Béthune, grandson of Philip Comte de Béthune, who was associated with Angoulême on that occasion, and who took indeed the chief management of the negotiation. The Duke of Angoulême was married, first, on the 6th of March, 1591, to Charlotte, daughter of the constable Henry de Montmorency; and, secondly, on the 25th of February, 1644, to Franoise de Nargonne, who survived him many years, dying on the 10th of August, 1715, at the age of ninety-two. He left two sons by his first wife, the eldest of whom,

Henry, was in 1618 consigned to a lunatic asylum, when the other, Louis Emanuel, who had been educated as an ecclesiastic, like his father, relinquished the church for the camp. He succeeded his father as Duke of Angoulême, but at his death, in 1653, left only a daughter, who died in 1696 without issue. It is said that at the beginning of the last century, Bouthillier, bishop of Troyes, was in possession of a collection of manuscript letters by the elder Duke of Angoulême, from the 19th October, 1633, to the 20th December, 1643, and also of a collection of those of his son. (*Biog. Univ.*)

ANGOUMOIS, a district in France, which was united with that of Saintonge, in one province or military government, until that mode of division was superseded at the revolution by the division into departments; it coincided, though not exactly, with the department of Charente. It is watered by the river Charente, which rises within its limits, and pursues a very winding course through it; and by several tributaries of that stream, among which are the Tardoire and the Bauliat, and the Touvre. The Tardoire comes from the province of Limousin, and its waters, after heavy rains, unite with those of the Bauliat; but at other times, both these streams, before their junction, are swallowed up and lost in pits (either open or filled with a sand, through which the water filters) which lie in their course. The water thus accumulated in subterranean reservoirs, is supposed to supply the stream of the Touvre. The Vienne, a feeder of the Loire, just passes through the eastern extremity of this province.

The surface of Angoumois is far from level; but its hills, which are of nearly a uniform height, rise to no great elevation. The climate is healthy, great heat and cold prevailing only for a short time; and the vegetable productions arrive at great perfection: but the soil is so variable in its fertility, and so large a portion of it is barren, that the district cannot be designated as productive, and the coolness of the spring is often very injurious to the vines, the cultivation of which is carried to a great extent. The white wines are delicate; and the brandy (designated from the town of Cognac, in this province) is highly esteemed. Grain of all sorts is raised; wheat, rye, oats, barley, maize: and the most fertile of the arable lands have yielded abundant harvests for ten or twelve years without requiring any manure; some are not even allowed to remain fallow. The fruits are of the finest quality, especially the peaches and pears; walnuts and chestnuts are abundant. The cultivation of the mulberry-tree has been attended to, in order to raise the silk-worm; flax is grown for the sake of the linseed; and to these productions we may add saffron.

Angoumois is a district of considerable interest to the geologist, and rich in mineral treasures. Stone, proper for building, is found in many places, and mill-stones are dug in the hills which border the valley of the Anguienne, a branch of the Charente. Iron mines are abundant; there is a mine of antimony at Menet, and extensive quarries of gypsum (*plâtriers*), in the neighbourhood of Cognac. See article 'Angoumois' in the volumes 'Géographie Physique' of the *Encyclopédie Méthodique*.

The province was anciently governed by counts, but having fallen to the kings of France, was ceded by John*, after the battle of Poitiers, to Edward III. of England. The inhabitants, however, drove out the English, and put themselves again under the French dominion a few years afterwards, namely, in 1371 or 1372. (*Encyclopédie Méthodique*, *Dictionnaire Universelle de la France*.) [See CHARENTE, ANGOULÊME.]

ANGRA, the capital of Terceira, one of the Azores, is on the south coast of the island, 38° 38' N. lat., 27° 15' W. long. Angra stands on an inlet, from which it derives its name; *angra* being a Portuguese word, signifying a small bay or inlet. Angra has always been the residence of the governor: it is also an episcopal town, and contains a cathedral, five parish churches, four monasteries and four convents, and an arsenal. It is fortified and defended by a castle. The old accounts describe Angra as well built, with broad and straight streets: from about 1533, it became a city. It is the residence of French, English, and Dutch consuls, and carries on some trade. The population is probably 15,000 or 16,000.

From the 15th March, 1830, till the recent events in Portugal, Angra was the residence of the regency which

governed in the name of Donna Maria. During this time, its fortifications were strengthened. [See TERCEIRA.]

ANGRAB, a branch of the river TACAZZE, in Abyssinia.

ANGUILLA, or Snake Island, so called from its figure, is one of the Antilles, situated in 18° 8' N. lat. and 63° 12' W. long.

This island was first settled by the English, in 1650, and has since continued in their possession. It is so low and flat, that it cannot be seen at a greater distance than four or five leagues. The soil is sandy and unproductive, and the place is deficient both in wood and water. It produces a little sugar and cotton, some tobacco and maize. The town is on the east side, near the north-east end; it is a small place, with very little commerce. The bay in which it stands is so shut in by reefs, as to be of little value as a harbour. Anguilla is very near the north side of the island of Saint Martin: the channel between the two, which in some parts is not more than four miles wide, affords good anchoring ground, in from seven to twenty fathoms water. Several small, low islets lie to the west of Anguilla; the largest of these, Dog Island, has a few inhabitants.

Anguilla is about twenty miles long, and six broad, and contains between 700 and 800 inhabitants. (Purdy's *Colombian Navigator*; Livingston's *Derrotero de las Antillas*.)

ANGULAR VELOCITY. [See VELOCITY.]

ANGUS [See FORFARSHIRE.]

ANHALT is an ancient principality in the north of Germany, the name of which is derived by some from 'Burg an der Halle' (castle on the steep), and by others, from 'Burg von Stein ohne Holt,' or castle of stone without wood. It lies between 51° 35' and 52° 6' of N. lat., and 11° 38' and 12° 34' of E. long.; it is inclosed almost on every side by the Prussian territories, viz., by Brandenburg on the north, Prussian Saxony on the east and south, the earldom of Mansfeld on the south-west, and the territories of Brunswick, and the Prussian circle of Magdeburg, on the north-west. It is watered by the Elbe, which flows through it from east to west, and by its tributaries, the Mulde and Saale: it produces corn, fruit, flax, hemp, tobacco, timber, silver, copper, iron and coals, rears a considerable quantity of cattle and sheep; and contains a population of 133,000 souls, of whom upwards of 130,000 are Protestants, both prince and people having embraced the Reformation, and dissolved their monastic institutions, at so early a period of its propagation as between the years 1521 and 1532. Occupying an elongated tract, the largest portion of which lies on the right bank of the Elbe, and of which the greatest length is sixty miles, with a breadth varying from twelve to sixteen, this triple duchy contains nineteen towns, four villages with markets, and 249 other villages. Of the towns, four possess a population exceeding 5000 souls: viz., Dessau about 10,000; Zerbst 8000; Coethen 6500; and Bernburg 5800. The form of government is monarchical, and the sanction of its diets is required to the imposition of taxes, though the fundamental laws rest on the various ordinances promulgated by its princes. This principality, which is exceeded in fertility by no state in Germany, and forms a richly-cultivated plain, excepting where the acclivities of the Hartz Mountains project in the direction of Bernburg, was formerly a compact territory, and its rulers derived their origin from Ascanius, grandson of Japhet, the son of Noah, whose descendants are reputed to have migrated from the marshes of Ascania, in Bithynia, and, at last, to have settled among the forests of Germany. Hence, the princes of Anhalt to this day designate themselves 'Counts of Ascania.' Their ancestral seat was the stronghold of Anhalt, lying on the Hartz, which is said to have been built by Esico of Ballenstaedt, in 940. Its only remains, at the present day, are the crumbling fragments of some of its vaults, and a noble ash, rising from the midst of them, over which floats a red and white banner. There is an inscription to the following effect against its trunk:—'Among ruins and shady foliage,—in memory of a noble ancestry and their achievements, prowess, and piety—with mourning, at the evanescence of earthly things,—and with joyfulness, at the imperishable existence of justice, virtue, faith, hope, and love,—posterity lifts up its regards to a higher sphere. In fact, there is no family in Germany which has produced a

* At the peace of Bretigny, A. D. 1360, four years after the battle of Poitiers.

greater number of brave and skilful warriors than the House of Anhalt; beginning with Bernhard, who declined the imperial sceptre in 1198, because he deemed himself 'too corpulent' for such a dignity; or from Wolfgang, one of the staunchest soldiers of the Reformation, who, on being reinstated in his possessions after he had been expelled from them by its opponents, exclaimed, 'Though old and poor, I would give a thousand florins could I but gibbet—a Pope, down to Leopold, ('biter of bulls,' as he was christened by Prince Eugene, on account of his detestation of the papacy,) who led the Brandenburg troops to victory in the Low Countries and Italy, created the Prussian infantry, and invented the iron ramrod. He stood foremost of five field-m Marshals who distinguished themselves in the Prussian service in the first half of the last century. Upon the death of Joachim, which happened in 1586, (the inheritance of the several branches of the House of Anhalt having been united in his person,) his four sons divided the principality between them; and thence arose the respective sovereignties of *Dessau, Bernburg, Zerbst, and Coethen*.

The third of these became extinct in 1793, and was shared in equal portions among the three surviving branches. Their erection into duchies is of recent date; the prince of Bernburg having been created duke in 1806, and the princes of Dessau and Coethen having been raised to the same dignity in the following year. The three duchies possess, in conjunction with Oldenburg and Schwartzburg, a single vote in the minor assembly of the diet of the Germanic Confederation, but each of them a distinct vote in its plenary assemblies; they furnish a contingent of 1024 men to the army of the Confederation. Their united revenues (according to Malchus) amount to 1,196,000*l.*, and their public debt to 290,000*l.* (See *BERNBURG, COETHEN, and DESSAU*.)

ANIHOLT is a small Danish island, with a lighthouse, between the shores of Jutland in Denmark and Helmsund in Sweden, in the Kattegat, 56° 38' N. lat., 11° 35' E. long. It was taken by the English during the last war, and an ineffectual attempt to recapture it was made by the Danes in 1811. Its inhabitants do not exceed 100 in number, and subsist by catching seals and fish.—Also, the name of a small town on the old Yssel, in Westphalia, nine miles north-east of Nimeguen, with a handsome palace, the residence of the prince of Salm-Salm. Population 1700. By the treaty of Vienna, it was placed under the sovereignty of Prussia.

ANIELLO, TOMMASO, called by corruption Masaniello, a young fisherman, and a native of Amalfi, lived at Naples towards the middle of the seventeenth century, under the government of the Duke d'Arcos, Viceroy of Philip IV. of Spain. Naples was then suffering all the evils of delegated absolute power; its treasures went to Spain, its youth were sent to fill up the ranks of the Spanish army, and both were wasted in ruinous wars for the ambition and selfish views of a distant court. The people were oppressed with taxes, and suffered from the injustice and wanton tyranny of the officers and other agents of a foreign power. Besides the taxes which were laid upon every possible object of necessity or luxury, besides the sale of the crown lands as well as of the communal ones, and the adulteration of the currency, every new viceroy that came was instructed to demand a *gratuitous gift*, for the service of his master. The nobility assembled in their *sedili*, which were the only shadow remaining of the ancient representation of the country, were applied to by the viceroy to vote the amount, and distribute the quota of the gift among the various districts and families. In this manner alone more than one hundred millions of ducats had been paid by Naples into the Spanish treasury from the reign of Charles V., that is to say, in the course of a century. In the year 1647, the Duke d'Arcos, in order to defray the expenses of a war against France, thought, as a last expedient, to levy a tax on fruit and vegetables, the common articles of food of the Neapolitan people. The edict which announced this fresh impost occasioned the greatest ferment, especially among the poor classes of inhabitants. An old priest of the name of Genoino, who had been in prison for some former offence, contributed to inflame the general discontent. Masaniello, who was then about twenty-five years of age, and who, by his humour and natural quickness, was a great favourite among the people of the *mercato*, the great market-place of Naples, spoke loud among his friends against the new tax. His wife had been arrested some time before at the gates of the city, as she was trying to smuggle in some flour, which, like everything else, was a

taxed article. She was kept in prison several days, and her husband had to pay in order to obtain her release. Masaniello had, accordingly, as we might expect, conceived a violent hatred against the Spanish government.

Masaniello was at the head of a troop of young men who were preparing for the great festival of our Lady of the Carmel, by exhibiting sham combats, and a mock attack on a wooden castle. On the 7th of July, 1647, he and his juvenile troop were standing in the market-place, where, in consequence of the obnoxious tax, but few countrymen had come with the produce of their gardens; the people looked sullen and dissatisfied. A dispute arose between a countryman and a customer who had bought some figs as to which of the two was to bear the burden of the tax. The *eletto*, a municipal magistrate, acting as provost of the trade, being appealed to, decided against the countryman; upon which the latter, in a rage, upset the basket of figs on the pavement. A crowd soon collected round the man, who was cursing the tax and the tax-gatherers. Masaniello ran to the spot, crying out 'No taxes, no more taxes!' The cry was caught and repeated by a thousand voices. The *eletto* tried to speak to the multitude, but Masaniello threw a bunch of figs in his face, the rest fell upon him, and he and his attendants escaped with difficulty. Masaniello then addressed the people around him in a speech of coarse, hot, fiery eloquence; he described their common grievances and miseries, and pointed out the necessity of putting a stop to the oppression and avarice of their rulers. 'The Neapolitan people,' said he, 'must pay no more taxes!' The people cried out, 'Let Masaniello be our chief!' The crowd now set itself in motion, with Masaniello at their head; it rolled onward, increasing its numbers at every step; their rage fell first on the toll-houses and booths of the tax-collectors, which were burnt, and next on the houses and palaces of those who had farmed the taxes, or otherwise supported the obnoxious system. Armed with such weapons as they could procure from the gunsmiths' shops and others, they proceeded to the viceroy's palace, forced their way in spite of the guards, and Masaniello and others of his companions having reached the viceroy's presence, peremptorily demanded the abolition of all taxes. The viceroy assented to this; but the tumult increasing, he tried to escape, was personally ill-treated, and at last contrived, by throwing money among the rioters, to withdraw himself into the Castel Nuovo. The palaces were emptied of their furniture, which was carried into the midst of the square and there burnt by Masaniello's directions. Masaniello was now saluted by acclamation as 'Captain-general of the Neapolitan people,' and a platform was raised for him in the square, where he sat in judgment in his fisherman's attire, holding a naked sword in his hand. Thence he issued his orders, and his will was law. The citizens in general, besides the populace, obeyed him, a sort of commonwealth was organized, and the men were armed and distributed into regiments. The few Spanish and German troops of the viceroy were defeated, and obliged to defend themselves within the castles. The viceroy in this extremity proposed Cardinal Filomarino, the archbishop of Naples, who was a man of abilities, and withal popular, to act as mediator between him and the people. Articles were drawn up under Masaniello's direction, by which all imposts upon articles of consumption were abolished, and the privileges granted by Charles V. restored, besides an amnesty to all concerned in the insurrection. It was agreed that these were to receive the viceroy's signature, and an early day was fixed for the purpose. The cardinal, accompanied by Masaniello, dressed in splendid attire and mounted upon a fine charger, proceeded to the Castel Nuovo, followed by an innumerable multitude. The viceroy received Masaniello with every mark of deference, and the conditions were examined and accepted. As Masaniello loitered within the castle, the populace outside grew impatient and tumultuous, when the chief of the people appeared at a balcony, and by a sign of his hand silenced them immediately; at another sign, all the bells tolled and the people shouted *Vivas!* and again, as he placed his finger across his lips, they all became mute. The viceroy being now convinced of the astonishing power of this man, the negotiation was soon concluded, after which the Duke d'Arcos put a gold chain round Masaniello's neck and saluted him as Duke of St. George. Masaniello returned in triumph to his humble dwelling, and peace was momentarily restored.

But Masaniello's mind gave signs of fatal decay: his sudden and giddy elevation, the multiplicity of questions that

were referred to him, his total inexperience of business, the heat of the season, his want of sleep,—all helped to derange his intellects. He had already complained of a sensation 'like that of boiling lead in his head;' he became suspicious, and was in continual dread of traitors, especially after the attempt made by a troop of banditti who had mixed with the people to shoot him on his tribunal in the market-place. The wretches were of course put to summary death, but the fears of Masaniello continued, and he ordered every man, even ecclesiastics, to leave their cloaks and long robes, and appear in short clothes in the streets. Meantime the chief of the people was administering justice from a low window of his house, with a loaded blunderbuss in his hand, and his door surrounded by guards. He showed himself capricious, absurd, and cruel, though cruelty does not appear to have been a vice natural to his character. He began to lose his credit with the multitude; the rebel government besides required money; and, as the only expedient, taxes upon eatables were resorted to again from sheer necessity. Masaniello evidently had no fixed or regular plan; his only idea was to remove the taxes and to humble the nobility, but he had no notion of setting aside the sovereignty of the King of Spain. In his hatred against the Neapolitan nobility, he devoted to destruction sixty palaces, only twenty-four of which, however, were burnt. He pronounced sentences of death with a frightful volubility. His lazzaroni were animated with similar feelings: they carried boat-hooks in their hands, which they said were for the purpose of pulling the gentlemen from their horses. Masaniello at times felt his growing weakness: he talked of abdicating his power and returning to his fishing-nets; but he had gone already too far. Some wretches, among whom was the old priest Genoino, who had been bribed to effect Masaniello's ruin, encouraged him in his mad career. On the 14th of July, being the eighth day of the insurrection, Masaniello took it into his head to proceed on a party of pleasure by sea to the Cape of Posilipo. The viceroy ordered his barge to be got ready for him; and Masaniello went, accompanied by musicians and followed by an immense multitude, who crowded to meet him at his landing. On arriving, he went to mass, it being Sunday, and then threw himself into the sea with his clothes on. After this he sat down to supper, at which he swallowed an enormous quantity of the strongest country wine, and was carried home in a state of intoxication. Next day he repaired, as usual, to his judgment-seat; the people still clung to him, and he was still all-powerful: but he behaved so outrageously on that day, that his friends became convinced of his insanity, and watched him during the night. On the morning of the 16th, being the great holyday of the Virgin, Masaniello escaped from the care of his friends and ran to the church del Carmine, where the archbishop was performing mass. At the end of the service, Masaniello ascended the pulpit, with a crucifix in his hand, and harangued the numerous audience. He earnestly and pathetically reminded them of what he had done for them, he tore his clothes, bared his breast, and showed his body, extenuated by watching and continual anxiety. He entreated them not to abandon him into the hands of his enemies. The people were affected by his address, but all at once poor Masaniello relapsed into one of his fits of aberration; he lost the thread of his discourse, and talked incoherently and wildly. The people began to laugh, and many left the church; Masaniello was taken down from the pulpit by the priests; the archbishop spoke to him kindly, and advised him to rest and calm himself awhile in the adjoining convent. He was taken into one of the cells, where a change of clothes was given him, and he lay down on a couch and rested a few minutes. He soon started up again, and stood looking out of a window in a melancholy mood upon the tranquil and beautiful bay of Naples, which lay stretched before him, thinking, perhaps, of the happier times when he used to glide on the waters in his fishing-boat, when all at once cries were heard in the corridor, calling him by name. Armed men appeared at the cell-door. Masaniello turned towards them: 'Here I am—do my people want me?' A discharge from their arquebuses was the wretches' answer; and Masaniello fell, exclaiming, 'Ungrateful traitors!' and expired. His head was cut off, fixed on a pole, and carried to the viceroy, the body dragged through the streets by a troop of boys, as he had himself foretold a few days before, and then thrown into a ditch. The revolt, however, was not yet quelled: the people, after appointing the Prince of Massa for their chief, whom they soon after murdered, chose Gennaro Annese, one of the vil-

lains who had plotted against Masaniello's life. This chief was soon superseded by the Duke of Guise, who came to try his fortune at Naples as the representative of the ancient house of Anjou. [See GUISE.]

ANIMAL, the general name for living organized beings. This is not intended as a definition: we purposely abstain from attempting one. The classification of animals according to Cuvier's system, is given under the head of **ANATOMY, COMPARATIVE**.

ANIMAL MAGNETISM, a pretended agent of a peculiar nature, supposed to be capable, in some mysterious mode, of producing the most powerful effects on the human body. The rise and progress of animal magnetism affords one of the most striking examples on record of the influence, through the imagination, of the mind upon the body, and at the same time, one of the most curious cases of knavery and credulity in the history of the delusions of the human mind. A brief account of it may be not without amusement and instruction.

It was in the year 1734 that **Mersburg** in Swabia had the honour of giving birth to **Anton Mesmer**, the discoverer of animal magnetism. This celebrated man studied physic at Vienna, and took his degree of doctor of medicine in the university of that place, in the year 1776. On that occasion he published an inaugural thesis on the *Influence of the Planets on the Human Body*. It chanced that the professor of astronomy at Vienna, a Jesuit, named father Hehl, the friend of Mesmer, had great faith in the influence of the loadstone on human diseases, and had invented steel plates of a peculiar form which he impregnated with the virtues of the magnet, and applied to the cure of diseases 'with extraordinary success.' Mesmer, who had his own notion of the virtues of the magnet, availed himself of his friend's steel plates to employ the magnet according to his own peculiar views. Wonderful were the results; on the communication of which to father Hehl, his friend published an account of them; but in this account he attributed all the cures to the form of the plates, and spoke of Mesmer as a physician whom he had employed to make his experiments. Mesmer, expressing great indignation at this representation, accused Hehl of treachery, and of endeavouring to turn to his own advantage a discovery with which he had been entrusted in the confidence of friendship. Hereupon arose a violent controversy which ended in the total defeat of Mesmer, who, as if deriving fresh energy from discomfiture, went on working greater cures than before, and making incomparably greater noise about them. Nevertheless, being deserted by all men of science, who universally regarded him as an impostor, he was obliged to quit Vienna. After travelling some time in different parts of Germany and Switzerland, continuing every where to work wonderful cures, at last in a lucky hour he set out for Paris, where he arrived in the year 1778. His first care, on reaching this new and favourable theatre for his exploits, was to procure public apartments for the treatment of patients. And thither speedily flocked peer and peasant in such numbers that his apartments were crowded, and hundreds were ready to attest the wonderful cures wrought upon their own persons by the great magnetizer. In the general excitement, it would have been wonderful if no regular member of the medical faculty had become a convert. Mesmer found a highly useful one in a certain M. d'Eslon, who openly professed his conversion to the system, and who practised it with so much success that he is said to have received in fees from his patients no less a sum than 100,000*l*. The disciple in this proceeded further than was altogether satisfactory to the master. Mesmer complained bitterly that he was betrayed and ruined; and that the fruit of long study and incessant watchings, which it had been the labour of his life to bring to perfection, was snatched from him by another. He now applied to the government, and succeeded in obtaining the patronage of the queen. 'A château and its lands, where he might be enabled to continue his treatments at leisure and independently of persecution,' was what he asked. A life-rent of twenty thousand francs per annum, and in lieu of the château and its lands another sum of ten thousand francs a year to enable him to select a proper situation for the treatment of his patients, were actually offered him. The offer, however, was coupled with one condition, namely, that three persons named by the government should witness and report upon his proceedings. Nevertheless it was stipulated that, even if the report of these persons should prove unfavourable, the sums promised him should not be

forfeited, while, if favourable, he might look for the most splendid rewards. But Mesmer was sharp-sighted enough to foresee that the report would not be favourable, and that the reward would not be continued if undeserved. He therefore suddenly quitted France and repaired to Spa. Thither he was followed by several patients of rank and fortune, who, on condition that he would communicate to them his doctrine and practice, bound themselves to find one hundred persons who would pay him each 2400 francs for his instructions. The sum actually raised by this subscription amounted to 340,000 francs, nearly equal to 14,000*l.* sterling. On receiving this sum, Mesmer returned to Paris and recommenced his public treatments. Meantime his disciples, who had paid thus liberally for his instructions, formed themselves into what they termed *Sociétés de l'Harmonie*, for the purpose of gratuitously propagating the doctrines of animal magnetism. But the master disputed their right to do this: the disciples, on the other hand, maintained that they had purchased the privilege; at all events they resolved to exercise it, and set about doing so; and now Mesmer, seeing no prospect of making any further personal advantage by his discovery, quietly put the money in his purse, quitted France, retired to his native place, and gave himself no further trouble about the success or the failure of animal magnetism.

Such is the history of the discoverer: of the discovery Mesmer himself gives the following account:—'Animal magnetism is a fluid universally diffused; it is the medium of a mutual influence between the heavenly bodies, the earth, and animated bodies: it is continuous, so as to leave no void; its subtilty admits of no comparison: it is capable of receiving, propagating, communicating all the impressions of motion; it is susceptible of flux and of reflux. The animal body experiences the effects of this agent; by insinuating itself into the substance of the nerves it affects them immediately. There are observed, particularly in the human body, properties analogous to those of the magnet; and in it are discerned poles equally different and opposite. The action and the virtues of animal magnetism may be communicated from one body to other bodies, animate and inanimate. This action takes place at a remote distance, without the aid of any intermediate body; it is increased, reflected by mirrors; communicated, propagated, augmented by sound; its virtues may be accumulated, concentrated, transported. Although this fluid is universal, all animal bodies are not equally susceptible of it; there are even some, though a very small number, which have properties so opposite, that their very presence destroys all the effects of this fluid on other bodies. Animal magnetism is capable of healing diseases of the nerves immediately, and others mediately. It perfects the action of medicines; it excites and directs salutary *crises* in such a manner, that the physician may render himself master of them; by its means he knows the state of health of each individual, and judges with certainty of the origin, the nature, and the progress of the most complicated diseases; he prevents their increase, and succeeds in healing them, without at any time exposing his patient to dangerous effects or troublesome consequences, whatever be the age, the temperament, and the sex. In animal magnetism nature presents a universal method of healing and preserving mankind.' (*Mémoire sur la Découverte du Magnétisme Animal*, par M. Mesmer, Paris, 1779, pp. 74, et seq. *Ibid. Avis au Lecteur*, p. 6.)

The mode of bringing the magnetised under the influence of the magnetic fluid was peculiar. In the middle of each room in which the persons to be treated were collected was placed a large circular vessel, made of oak-wood about a foot or a foot and a half in height: the interior of this vessel was filled with pounded glass, iron filings, and bottles containing magnetised water arranged symmetrically: the cover or upper part of the vessel was pierced with numerous holes, in which were placed polished iron rods of various lengths, bent and capable of being moved: this was called the *baquet* or magnetic tub. The patients were placed in successive rows around the *baquet*, and each had one of the rods of iron, the end of which he applied to the part of his body which was supposed to be the seat of his disease: a cord passed around their bodies united the patients to one another, and sometimes they formed a second chain by taking hold of each other's thumbs. A piano-forte was placed in the corner of the room, and various airs were played upon it, sometimes accompanied with the sound of the voice and song. The magnetizer held in his hand a

polished and pointed rod of iron from ten to twelve inches long. The *baquet* was a reservoir of magnetic virtues; its interior arrangement was for the purpose of concentrating the magnetic fluid; the rods were the conductors for transmitting it. The cords around the bodies of the patients and the other chain of connection by the thumbs were for increasing the effects of the fluid by communication. The magnetizer had previously charged the piano-forte with magnetic fluid; the person playing on it was incessantly giving out more; the sound conducted it to the patients. The purpose of the music was to put the patients into a state of quiet; to give them agreeable sensations, and thus to dispose them to receive the magnetic action. The purpose of the magnetizer's rod was to concentrate to a point the fluid which issued from him, and thus to render it more powerful. The sick persons arranged in great numbers and in several rows around the *baquet*, thus receive the magnetism by all these means; by the iron rods which convey to them that of the *baquet*; by the cords wound round their bodies; by the connexion of the thumbs which communicate to them that of their neighbours; by the sound of the piano-forte or of an agreeable voice diffusing the magnetism in the air; by the finger and rod of the magnetizer moved before their faces, above or behind their heads, and on the diseased parts, always observing the direction of the poles; by the eye of the magnetizer; but above all by the application of his hands and the pressure of his fingers on the hypochondria and on the regions of the abdomen; an application often continued for a long time, sometimes for several hours. Meanwhile the patients in their different conditions present a varied picture. Some are calm, tranquil, and experience no effect; others cough, spit, feel slight pains, local or general heat, and have sweatings; others again are agitated or tormented with convulsions. These convulsions are remarkable in regard to the number affected with them and to their duration and force; and are characterized by the precipitous involuntary motions of all the limbs and of the whole body, by the constriction of the throat, by the leaping motions of the hypochondria and the epigastrium; by the limness and wandering of the eyes; by piercing shrieks, tears, sobbing, and immoderate laughter. They are preceded or followed by a state of languor and reverie, a kind of depression, and even drowsiness. The smallest unforeseen noise occasions shudderings; even a change of tone and measure in the airs played on the piano-forte influences the patients, a quicker motion agitating them more and renewing the vivacity of their convulsions. Nothing is more astonishing than the spectacle of these convulsions; one who has not seen them can form no idea of them. The spectator is equally astonished at the profound repose of one part of the patients and the agitation of the rest; at the various accidents which are repeated and the sympathies which are established. Some patients devote their exclusive attention to each other, rushing towards one another, smiling, speaking with affection and mutually soothing their *crises*. All are under the power of the magnetizer; it matters not in what state of drowsiness they may be—his voice, a look, a gesture brings them out of it.

Such is the account of M. Bailly, who, together with Lavoisier, Franklin, and other distinguished men were appointed by the French government to examine into these splendid pretensions. These commissioners report:—'That this pretended agent certainly is not common magnetism, for that, on examining the *baquet*, the grand reservoir of this wonderful fluid, by means of a needle and electrometer, not the slightest indication of the presence either of common magnetism or of electricity was afforded; that it is wholly inappreciable by any of the senses or by any mechanical or chemical process; that they tried it upon themselves and upon many others without being able to perceive anything; that on blindfolding those who seemed to be most susceptible to its influence, all its ordinary effects were produced when nothing was done to them but when they imagined they were magnetized, while none of its effects were produced when they were really magnetized, but imagined nothing was done; that, in like manner, when brought under a magnetized tree nothing happened if the subjects of the experiment thought they were at a distance from the tree, while they were immediately thrown into convulsions if they believed they were near the tree, although really at a distance from it; that, consequently, the effects actually produced were produced purely by the imagination; that these effects, though some cures might be wrought, were not with-

out danger, since the convulsions excited were often violent and exceedingly apt to spread, especially among men feeble in body and weak in mind, and almost universally among women; and finally, that there were parts of the operation of magnetizing which might readily be turned to vicious purposes, and that immoral practices had already actually grown out of them.

Notwithstanding such a report from men so well qualified to form a judgment, animal magnetism continued to flourish to such a degree, that Dr. Franklin, writing some time after this report had become public, and adverting to the proneness of mankind to credulity, states that Mesmer was at that time getting more money in the shape of fees than all the regular physicians in Paris put together. To this day the belief of it is common, if not general, in Holland, Germany, and other continental nations. The thing never took root in England. There was at one time some danger of it, but it was prevented by the skilful management of a physician of eminence. A man of the name of Perkins had invented a wonderfully convenient instrument for collecting, condensing, and applying animal magnetism, composed of a metallic substance, and called the metallic tractor. For this instrument he had obtained a patent, and its virtues he set forth in a work bearing the following title—*The Efficacy of Perkins's Patent Metallic Tractors in various Diseases of the Human Body and Animals; exemplified by two hundred and fifty cases from the first literary characters in Europe and America. With a Preliminary Discourse in Refutation of the Objections made by Interest and Prejudice to the Metallic Practice.* Dr. William Falconer, of Bath, having made tractors of wood so exactly resembling the patent tractors that it was impossible for the eye to distinguish between the one and the other, tried, in conjunction with Dr. Haygarth, the effect of these fictitious tractors on a large scale on patients in the Bath Hospital, and produced precisely the same effects with the fictitious as with the genuine, affording a demonstration that whatever effects were produced, were produced solely by the imagination. The publication of these cases put an end to the virtues of the metallic tractors in England; but we have little cause to congratulate ourselves on a greater exemption from credulity than our continental neighbours, as we all know by very recent instances. Nothing can prevent the success of such impostors, or put an end to the grievous evils they occasion, but the diffusion among the people of sound knowledge relative to the functions of the animal economy, the nature of diseases, and the mode in which remedies operate in their prevention and cure. See *Report of Benj. Franklin and other Commissioners charged by the King of France with the Examination of Animal Magnetism as now practised at Paris. Translated from the French, with an Historical Introduction*, 8vo. 1785; *The Foreign Review and Continental Miscellany*, No. IX. Nov. 1829, art. Animal Magnetism.

ANIMAL PHYSIOLOGY. [See **PHYSIOLOGY.**]

ANIMALCULES, in zoology, is the name which has been applied to small animals of various classes, which cannot be distinctly seen without the use of a microscope, as the minute radiata animal of the coral, the worms found in paste, vinegar, and vegetable infusions, or the smaller crustacea found in pools, as the *minoculi*. Some of these will be referred to under their proper heads; and a general notice of them will be found under **INFUSORIA**.

ANIO. [See **TEVERONE.**]

ANISE. [See **PIMPERNELLA.**]

ANJAR, a small district in the province of Cutch, in Hindostan. It came into possession of the English in 1816, and was again transferred to the Rao of Cutch in 1819, in consideration of an annual sum of 88,000 rupees to be paid to the East India Company out of the surplus revenues. The government of the district is still, however, virtually exercised by the Company, by means of a resident commissioner deputed from the presidency of Bombay.

The country of Anjar is extremely arid, and suffers much from scarcity of water, which cannot be obtained without sinking wells to a great depth; the soil also is so loose and sandy as to present obstacles to forming tanks. It has been the custom, that any person who sinks a well at his own expense, in an uncultivated tract, should become entitled to appropriate to his own use the whole of the land which he could irrigate by means of its water. The Bombay government having an interest in the prosperity of the cultivators, has caused several tanks to be constructed, in con-

sequence of which tillage has been extended, and the district much improved. (*Report of the House of Commons on the affairs of India, Session 1832; Hamilton's East India Gazetteer.*)

ANJAR, the capital of the district of the same name, is in 23° 3' N. lat., and 70° 11' E. long.

The town is built on the side of a hill, about ten miles from the Gulf of Cutch. The fortifications are not strong, the walls being only six feet in thickness, and without a ditch. Anjar was besieged and taken in 1816 by a British corps. In 1819 it experienced the shock of an earthquake, by which nearly one-half of the houses were thrown down, and about 200 persons were killed. The population in the following year was estimated at 10,000 souls. (*Hamilton's East India Gazetteer.*)

ANJOU, one of the provinces or military governments into which France was divided before the revolution. It includes the present departments of Maine and Loire, with portions of several of the surrounding ones, especially of Sarthe, Mayenne, and Vienne. It comprehends a part of the valley of the Loire, by which river it is traversed in a direction from east to west, and it is watered also by the navigable rivers Loir and Sarthe, which, entering the country from the north-east, unite their streams and fall into the Mayenne, (also navigable,) which, rising in Normandy and crossing Maine, enters Anjou from the north. The Mayenne, having received the Sarthe and Loire, passes the town of Angers, and falls into the Loire. Another feeder of the Mayenne, the Oudon, which flows from the north-west, is also navigable; so that few countries are more favoured by nature with the means of water-conveyance than the part of Anjou north of the Loire. The part south of that great river has only one navigable stream, the Thouet, which falls into the Loire at Saumur, near the western extremity of the province.

Anjou is bounded on the north by Maine, on the east by Touraine, on the south by Poitou, and on the west by Bretagne. Its form is very irregular, especially in the east, where the district of Saumurais runs out to the south-east between Touraine and Poitou. Its capital was Angers, (see **ANGERS**), and nearly the whole country was included in the bishoprick of which that town was the seat.

The climate of Anjou is healthy and mild; and the soil, which is agreeably diversified with hills and plains, is rich in various productions. (*Encyclopédie Methodique; Dict. Univ. de la France, &c.*)

ANJOU, the **DUKES** and **COUNTS** of, were amongst the earliest noblesse of France. Some chronieler gives the title to the famous Roland. Charles the Bald, it is said, bestowed the province upon one of his courtiers, from whom the first family of counts, in general named Fulke, were descended. One of this name was amongst the peers who raised Hugh Capet to the throne; and his descendants gallantly defended their county against the lords of Champagne, of Poitou, and of Normandy. A count of Anjou, also styled Fulke, joined the early crusades, and became King of Jerusalem. His son Geoffrey married (in 1127) Matilda, or Maud, daughter and heiress of king Henry I. of England, to the crown of which kingdom he gave as heir, Henry Plantagenet. Thus merged the first house of Anjou. Soon after the conquest of the province, by the French, it was bequeathed by Louis VIII., in 1226, to his fourth son, Charles of Anjou, who commenced the second house of Anjou, and raised it to a height of grandeur and renown no longer proportioned to the little province from which it derived its title. He espoused the daughter of Raymond Berenger, last count of Provence, and through her inherited that extensive fief, including the greater part of the south of France. He accompanied his brother St. Louis in his crusade to Egypt, when he was taken prisoner with that monarch, but soon afterwards ransomed. His government of Provence was marked by rapacity, overbearing cruelty, and contempt for the privileges of his subjects. Such, however, was the prince whom the pope selected for the throne of Naples, in opposition to Manfred and Conradin, the last of the Hohenstauffen. The pontiff was induced to select Charles as his champion by the report of his great wealth, and Charles was forced to accept by the ambition of his wife, who could not endure that she alone of all her sisters went without the title of queen. Charles of Anjou therefore made his preparations in men and money for the conquest of Naples, whilst his ally, the pope, opened to him his spiritual treasures, by preaching a crusade in favour

of Charles against Manfred. The Angevin prince invaded Italy with an army of 30,000 men, in 1265, but that year, and almost another, passed away, before the French entered the kingdom of Naples. Manfred, with a force of Neapolitans, Saracens, and Arabians, took post not far from Beneventum in the plain of Grandella. The French accepted with alacrity the battle that was offered, and it was fought with the utmost gallantry on both sides. The Neapolitan nobles, however, at last deserted their prince, who instantly tearing his crest from his helmet to prevent his being recognised, rushed into the thickest of the fight and was slain. The victory declared for Charles, who made the most cruel use of it. Not only was no mercy shown in the field, but the neighbouring town of Beneventum was given up with its population to the brutal fury and avarice of the soldiers. After this consummation of his crusade, Charles of Anjou made his triumphant entry into Naples. His government bore the same stamp with his conquest; it was but a succession of oppression and rapine. The pope himself was obliged to reproach the new sovereign of his choice, with employing 'none but robbers and brigands, to whom adultery and rape were as familiar as spoiliations.' Such is the pope's record of the effects of the crusade preached by himself.

Charles of Anjou, as head of the Guelphic party in Italy, was more than sovereign of Naples. Ramifications of the two great parties disputed Tuscany also, and Charles marched to chase his enemies, the Ghibelins, from that country. In this enterprise also he succeeded, and the Guelphs of Florence procured his nomination as political chief of that city for a period of ten years.

The Ghibelin party, however, rallied. They summoned young Conradin, nephew of Manfred, from Germany to support their cause, and the young prince advanced with a small but valiant army of Germans into Italy. Recalled to the south by the disaffection of the Neapolitans, Charles was able to offer no effectual resistance to Conradin, till the invader penetrated through the Abruzzi into the kingdom of Naples. 'Never was a country,' says Sismondi, 'more formed for a protracted war of defence by its mountains and its shepherd rice, yet the fate of Naples has always been decided by battle in the plain.' (See ABRUZZO.) So was it now. The armies met at Tagliacozzo, 5000 on the German, and 3000 on the Neapolitan side. Of these 3000, Charles placed 800 in ambush, and with them waited till the Germans, having routed the rest, were scattered in the pursuit. He then quitted his ambush, and gained an easy victory. Conradin was taken in flight. Charles did not blush to bring his young competitor to a mock trial, when he was of course condemned to death. This infamous sentence pronounced against the rightful prince, so stirred up the indignation even of Charles's friends, that his very son-in-law, Robert of Flanders, struck the judge, whilst in the act of pronouncing the sentence, with a blow that proved mortal. But this did not prevent young Conradin, together with his friends, amongst whom was the duke of Austria, from being brought to execution, which took place in one of the great squares of Naples. Charles of Anjou was present with all his court. When Conradin laid down his head for the executioner, he flung his glove amongst the weeping crowd, thus challenging an avenger. The glove was picked up and carried to don Peter of Aragon, who had married the daughter of Manfred, and who, under this claim, became the competitor of the House of Anjou.

For the time, however, Charles reigned without opposition, not only over Naples, but over the whole of Italy. An interregnum of the pontificate left Rome at his disposal, whilst almost all the cities of Lombardy imitated Florence in acknowledging him as their protector, and in swearing allegiance to him. Had Charles limited his views to Italy, he might perhaps have formed an independent kingdom of that country, but his boundless ambition drew him off to other enterprises, and instead of founding his dominion in Italy, he began to aspire after that of the East. His superstition, too, seemed to lead him astray; he was guilty of great crimes, and he could not neglect an opportunity of washing them away. This induced him, when his brother St. Louis set out upon a new crusade, to assume the cross. Charles, however, arrived at Tunis only in time to take command of the army which the death of St. Louis had left without a leader, and having satisfied his vow, Charles hastened to make peace on condition that Tunis should be tributary to Sicily. Gain was ever his first object. In re-

turning, he confiscated all the vessels of his allies, the Genoese, which had been wrecked in a storm, claiming them as waifs, although they had been damaged in the service of transporting his army.

But Charles's power, and his dream of founding an empire in Italy, were overthrown by the hands that had raised him. A pope was elected, (Gregory X.) who had at heart the interest of Christianity, more than those of a party. Instead of crushing the Ghibelins, he sought to reconcile them to the Guelpha, and in order to remove the anarchy of Germany, he procured the nomination of an emperor in the person of Rodolph of Hapsburgh. This was raising a dangerous rival to Charles, who had hitherto ruled the north of Italy in the character of *Imperial Vicar*, conferred on him by the pope. But old, bereft of spirit, and conscious of the general hatred borne to him, Charles was unable to make any effectual resistance. After a year or two of vain manœuvres and complaints, he was obliged to give up the great object of his ambition, and cede to Rodolph the hold which he had usurped over the north of Italy.

A vacancy of the pontificate enabled Charles to rally his party, and recommence his machinations for empire. By surrounding the conclave which met at Viterbo, and getting rid of the cardinals obnoxious to him, he succeeded in procuring the nomination of a pope in his interests. From Martin IV., (so the pontiff was called,) he obtained the preaching of a new crusade, directed however, not against the north of Italy, but of Greece. It was by occupying the throne of Constantinople, that Charles hoped to rise superior to Rodolph, and make good eventually his imperial claim on Italy itself. Whilst engaged in preparations for this great project, Peter of Aragon was making similar preparations for attacking Sicily and Naples. Peter gave out that he, too, was proceeding upon a crusade, but the French and papal courts divined his intentions, and gave due warning to that of Naples.

Charles had raised an enemy amongst his own subjects more active and deadly than any kingly rival. This was John of Procida, a Sicilian noble, a partizan of the house of Hohenstauffen, and who had suffered confiscation and exile on that account. This man never rested, even during the years of Charles's greatest triumph and power, from exciting disaffection towards him. For this purpose he visited Sicily to form a league amongst the nobles and people of the island against the French. He undertook to negotiate with Genoa, with Venice, and with the pope himself, a league for that purpose. He journeyed even to Constantinople, represented to the emperor Palæologus the designs of Charles, and succeeded in procuring for the king of Aragon a subsidy from the Greek. Peter fitted out a powerful fleet. But an accident in the mean time set fire to that train of disaffection and rebellion which John of Procida had prepared in Sicily.

It was on Easter Monday, in the year 1282, a day consecrated in Catholic countries to a mixture of gaiety and religion, that the citizens of Palermo set out according to custom to hear vespers at the church and village of Monteleale, not far distant. The French soldiers and authorities unsuspectingly joined the procession, and, according to their custom, did not refrain from taking liberties with the young females whom they met or whom they accompanied. One Frenchman, more bold than the rest, under pretence of searching for arms, forbidden to a Sicilian, seized a young girl, and thrust his hand into her bosom. The betrothed of the girl instantly pierced the Frenchman with his own sword. This act was a signal, it corresponded so fully to the intentions and feelings of all present, that the cry of 'Death to the French' ran from mouth to mouth. The deed accompanied the word, and every Frenchman in the procession was assassinated, whilst the vesper bell was still sounding. Excited by blood, the assassins rushed back to Palermo to complete their massacre. Not a Frenchman, save one, escaped: all, to the number of 4000, were butchered; and even Sicilian women, who had married Frenchmen, suffered the same fate, in order that the progeny of the hated strangers might be eradicated from the island.

This massacre, notorious under the name of the *Sicilian Vespers*, was of course the signal of revolt. John of Procida hastened to Peter of Aragon, who after some delay landed in Sicily, and assumed the title of its monarch. His admiral, Roger de Loria, sailed for Messina, to which

place Charles had laid siege, and experienced no difficulty in capturing Charles's fleet, and defeating all his projects of vengeance. The Angevin prince, in despair, acknowledged these disasters as the just judgment of Providence, and only prayed that his inevitable ruin might not at least be precipitate. His anger against his competitor was not the less outrageous. Despairing or impatient of the tedious method of warfare, Charles challenged Peter of Aragon to single combat; and Peter, whose object was to gain time, accepted the challenge. Bordeaux was fixed on as the place of combat, which was to take place between the monarchs in person, each supported by a hundred knights; and it was solemnly agreed on, that Sicily was to be the prize of the victor. On the day appointed, the 15th of May, 1281, Charles of Anjou appeared at the head of a hundred knights, whilst his brother king Philip the Hardy of France, approached with an army. Peter, however, demurred. He complained of the presence of a French army, of the insecurity of the place of rendezvous, not guaranteed, as was agreed on, by Edward of England. The king of Aragon, therefore, either did not make his appearance, or appeared but for a moment to make his protest, and instantly retreated to Spain. Thus the challenge of Charles served, as might have been expected, to delay, rather than hasten, a decision.

Charles now set about collecting a new fleet and forces in Provence, to which the pope contributed, as usual, the promise of an indulgence, and the sacred name of a crusade. But whilst thus engaged in recruiting, the fleet which he already possessed at Naples was defeated by Roger de Loria, and his son, who commanded it, was taken prisoner. Charles hastened to repair this fresh disaster; but in vain. The vigour of his character, as well as of his cause, was gone; and whilst endeavouring to muster ships and form a junction between his fleets, Charles of Anjou died at Foggia in the kingdom of Naples, at the age of seventy-five years, in the early part of 1285. Villani, the Florentine historian, has sketched his character minutely, calling him 'sage, severe, and magnanimous, much dreaded, more feared than any prince for royal dignity, of few words, but great activity, sleeping little, laughing never, and taking no pleasure in mines or poets, or courtesans.' Charles of Anjou had, in fact, many great qualities; and no prince certainly had ever greater opportunities. Had he made the most of them, he might perhaps have founded an empire in Italy. His reign, however, not only destroyed his own hopes of such an achievement, but that of his countrymen ever after. Henceforth the hatred borne to the French by the Italians was greater than the hate borne by them to the Germans, who have ever since preserved, with the exception of a few intervals, their predominance in the peninsula.

The posterity of Charles of Anjou continued, notwithstanding, to fill for a time the thrones of Naples and also that of Hungary. It is rather as monarchs of these countries, than as counts of Anjou, that their history is to be read or written, since of course they had become utter strangers to this province, and to France itself.

In consideration of this, king John of France reunited Anjou to the crown, giving it soon after in appanage to his son, Louis, who thus commenced the third house of Anjou. The county was elevated into a duchy, by an ordinance of John, in 1360, and Louis is thus the first of the ducal house. He was born in 1339, was taken prisoner with his father at the battle of Poitiers, and remained long in England. Wornied at length with captivity, he fled from that country, and refused to return, notwithstanding all the persuasions of John, who entreated him to keep his parole and return. After the death of king John, the duke of Anjou was entrusted with many commands by his brother Charles V., in all of which he displayed rapacity and cruelty. The title of Anjou seemed contagious in conveying these qualities. Still Charles at his death appointed Louis regent of the kingdom, who made use of his power to further his own personal interests. Instead of consulting the prosperity of France, the regent sought to amass wealth for the purpose of afterwards conquering the kingdom of Naples, to which Jeanne, the heiress of the last house of Anjou, had given him a title by adoption. The pope, as usual, seconded the attempt of the French prince, and Louis was accordingly crowned king of Sicily and Jerusalem at Avignon in 1382. He then led his armies to the conquest of Naples, but they perished, as Louis did himself, by disease, in 1384.

His son, Louis II., duke of Anjou, was also crowned

king of Sicily by the pope. Three times he essayed to render himself master of Naples, and on one occasion he defeated his rival, Ladislas, in battle. But all his efforts, united to the papal support, were unable to lessen the repugnance of the southern Italians to the French. Far from conquering Naples, he was unable to defend Anjou from the English, who continually ravaged it. He died in 1417.

Louis III., son of the last duke, attacked Naples, in 1420, with some success, but was beaten off by his competitor, Alphonso of Aragon. In 1423, he renewed the attempt, aided by the duke of Milan. The armies of this prince brought Louis in triumph to Naples, but while he was victorious in Italy, Alphonso was ravaging Provence. Louis, however, still persisted in prosecuting his conquest; he laid siege to Tarentum, but died soon after at Cosenza, in 1434.

He was succeeded, not so much in his kingdom as in his claim, by his brother René, surnamed the Good king René, who not only failed in recovering the Italian empire of his family, but was dispossessed of Anjou itself by Louis XI. [See RENÉ.]

From the days of Louis XI. the title of Anjou lay dormant, whilst the sovereigns of France themselves prosecuted their claims to Italian dominion, as heirs of the Angevin princes. With Francis I. these hopes expired. His successor, Henry II., bestowed the duchy of Anjou upon his third son, who bore this title when elevated to the throne of Poland. As this prince, however, succeeded to the throne of France, he is better known under the name of Henry III., to which the reader is referred. Henry's younger brother, at first duke of Alençon, succeeding to the title of Anjou, is best known under this latter name.

This prince was born in 1554, and was first christened Hercules, a name that was afterwards changed for that of Francis at confirmation. He had the small-pox very young, and was so 'horribly spoiled' that his mother, Catharine of Medicis, took a dislike to the boy, and sent him to Amboise to be educated apart from his brothers and from the court. Having once visited this place, Catharine spoke of him as 'a little *moricaud* (black), who had nothing but war and tempest in his head.' The young prince naturally returned his mother's aversion; and this may have been the original cause of his liberality of opinion, since it threw him into the confidence and friendship of Catharine's enemies, the Huguenots. The duke of Alençon, such was the title he first bore, was much attached to Coligny, their leader, who exerted himself to draw the young prince to his party. According to queen Margaret's Memoirs, the Huguenots had promised her brother Francis, at a very early epoch, to procure for him the principality of Flanders; and when the negotiations between Elizabeth and the first duke of Anjou were growing hopeless, Coligny mentioned to Walsingham, how much more desirable a husband for Elizabeth the duke of Alençon would prove than his brother. The idea was acted upon afterwards; and the duke of Montmorency in person proposed prince Francis as a husband to the queen of England. She wrote over for an account of his person, which was far from favourable. He was too young, it seems, and too small; and though Catharine de Medicis wrote to remind Elizabeth that heroes were of small stature, Du Guesclin himself, the famous constable, being no more than four feet high, and added in excuse of her son's youth, that his beard was beginning to grow, still Elizabeth showed herself more politic than amorous. The massacre of St. Bartholomew, which soon after occurred, created a distance and aversion between the two courts.

On that occasion the duke of Alençon maintained an honourable part. He so openly expressed his abhorrence of the event, and his admiration for Coligny, that he became as much an object of suspicion as any of the Huguenots. He was sent against La Rochelle, as to a school of martial orthodoxy, where he was nearly killed by a shot from the ramparts. Returning to court, he found himself more a captive than anything else, with Henry of Navarre, the future Henry IV., as his companion. Rivalry in their amours prevented the princes from agreeing perfectly, but the duke of Alençon not the less joined in all the projects and conspiracies of the Huguenots. They now conceived other hopes for him. Charles IX. was lingering under a mortal malady; his brother, the next heir, was in Poland. The Protestants hoped to elevate the duke of Alençon to the throne in his place; thus exchanging a monarch whom they detested, for one who favoured their own opinions.

A plot was accordingly formed. A Huguenot insurrection was to take place; the duke of Alençon, Henry of Navarre, and the prince of Condé were to fly secretly from court and join it. The queen herself was to be surprised at St. Germain. This promising scheme utterly failed through the perfidy and weakness of him whom it was designed chiefly to benefit. The duke of Alençon, instead of escaping at the appointed moment, hurried to his mother's feet, and confessed the whole affair. The consequence was the arrest of all who were implicated, and the failure of the enterprise. To render the act more base on the part of Alençon, the whole weight of vengeance fell upon his confidants and followers.

Whatever had been the motive which had influenced the duke of Alençon in betraying his friends, he reaped no advantage from the act. Catharine of Medici took him and Henry of Navarre with her, when, after the death of Charles IX., she went to welcome Henry III. on his return from Poland. She presented them as prisoners to the new king, who at first seemed severe, but inflicted no punishment. The duke of Alençon continued at court, the rallying point of opposition to Henry; opposition, however, which was as trivial as the character of the two princes.

At length the duke of Alençon, becoming reconciled to the Huguenots, who once more trusted him, entered into more manly schemes of vengeance. He escaped from court in the autumn of 1575, and placed himself at the head of the armies raised by the reformers. The king had not the vigour requisite to march against his brother; and he knew, perhaps, that under such a chief his enemies were not much to be dreaded. Instead of an army, Catharine surrounded her person with a score of beauties, and proceeded to entice the mutinous princes to colloquies, where seduction was the means of negotiation. A truce first, and a peace afterwards, were the fruit of a year's show of hostility. The duke of Alençon secretly proposed to desert his party once more; but the Huguenot chiefs insisted upon favourable terms, which they obtained, in name at least, in 1576. The duke, on his part, obtained advantages equally favourable; letters patent being soon after issued, which gave him the duchies of Anjou, Touraine, and Berri.

In this arrangement, however, the negotiators on both sides may be said truly 'to have reckoned without their host.' The Catholics, disgusted with the weakness of the monarch, formed the *league*, which soon rendered the articles of peace null. The Protestants on their side, little trusting to empty promises, kept armed and in an hostile posture, and Henry of Navarre was now rising amongst them to fill the place of honour that the now duke of Anjou had ceded. War, in consequence, recommenced, and, strange to say, the duke of Anjou himself appeared in command of a Catholic army.

In perusing the history of these times, it is difficult to say where most fickleness is found, whether in princes, or in the people. After having turned against the Huguenots, and even sacked one of their towns, the duke of Anjou was still trusted by them, and when overtures were made to him by the malcontents of the Low Countries, several of the leading Protestants forsook Henry of Navarre for the banner of the duke of Anjou. Sully himself was of this number. Henry was afflicted by this desertion, but remarked, that Anjou had 'so little courage, so little address, and so false a heart, that he would soon throw away all the advantages that fortune placed at his command.'

Catharine of Medici and Henry III., reconciled to their son and brother, now laboured to procure for the duke of Anjou those very prizes that Coligny had before sought to give him—the sovereignty of Flanders, and the hand of queen Elizabeth. When the States asked for French aid, every facility and support was given by the king towards the raising of an army for his brother; at the head of this the duke of Anjou marched against don John of Austria. He had at first some success, but not being so well received by the Flemings as he expected, his career of conquest was suspended. In pursuance of the other part of his scheme, he had deputed to Elizabeth his envoy, Simier. The French manners and gallantry of this personage quite won the English queen, who threw off much of her habitual prudery, and began to entertain serious thoughts of marrying Anjou. She made him a present of a considerable sum of money, and went so far that articles of marriage were drawn up. Fortune seemed on all sides to favour the duke.

He was elected sovereign of the Netherlands in 1581, and took possession of Cambray in spite of the prince of Parma. Thus, crowned with honour, the duke hastened over to England to terminate in person his suit with the queen. Nothing could be more brilliant or warm than his reception. When he stooped to kiss the hand of Elizabeth, she substituted the English custom of offering the mouth. Agreements of the closest alliance were concluded, and in token of her affection she gave him a ring, which she placed upon his hand in public. In the midst of all this graciousness, however, clouds began to arise. Leicester and other counsellors were jealous and averse; the people of London grew clamorous in their dislike of a popish prince, a dislike much increased by the conduct of the French, which was turbulent and licentious. One of them drew his dagger and pursued a foe into the private cabinet of the queen; and nearer acquaintance enabled both Elizabeth and the English to form a true judgment of their proffered allies. The queen at length hesitated. The habitual caution of her character got the better of her temporary whim; and at the end of three sleepless nights she sent for her suitor in order to put an end to his hopes by demands that amounted to a refusal. She wanted Calais, she could not tolerate his religion, and not satisfied with her own arguments, she called in Hatton to repeat them to the prince. The duke naturally railed at the inconstancy of women, especially of the English, and was about to depart instantly; but Elizabeth did all to soften his disappointment and her own. She detained him for months, feasted, and promised, and avoided him; beguiling both him and, perhaps, herself with hopes of a union which her prudence could never permit.

At length the duke of Anjou took his departure from England to govern the Netherlands. Bred up at the French court, however, he had no idea of a sovereign whose authority was to be shackled in any way, either by the institutions of a country, or even by his own most solemn oaths. The son of Catharine of Medici was not to be thus restrained. The duke of Anjou appeared to assume the sovereignty of the Netherlands with the determination to usurp despotic authority, and trample on the citizens as well as the family of Orange.

Unaccustomed to the free display of popular and personal independence, he mistook the rival influence of the prince of Orange, and of the citizens in the several towns, for insults to his dignity and treason to his rights. Instead of making use of such means to overcome them, as were allowed and might have succeeded with the Flemings, he formed a conspiracy similar to those which disgraced the annals of France at that epoch. He proposed, in fact, to seize the Flemish fortresses by means of his soldiers, and thus to bridle the turbulence of an independent people. But he mistook the character of the people. The Flemish citizens mastered his soldiers everywhere; the people of Antwerp especially made a successful resistance, and not only Anjou himself, but the French were expelled by the united force, and amidst the general execrations of the country. It was thus that another prince of Anjou had caused his countrymen first to be detested, and then driven from Italy. The name is linked with the chief political failing and chief disasters of the nation.

From this hour the duke of Anjou sunk into insignificance. He was too low in fortune and in character to mingle, or to have influence in any party, or in any struggle. He expired soon after, in 1584, at Château Thierry, bequeathing to his royal brother his creditors, 'whose sustenance and tears and suffering,' they being chiefly his own servants, 'he dragged with him to the grave.' Such were the words of his testament. His brother Henry, in lieu of paying the 300,000 crowns, to which his debts amounted, preferred expending 200,000 on a pompous funeral.

ANJOUAN. [See ANZOUAN.]

ANKER, a measure of wine and spirits, particularly of the latter, formerly in use, containing 10 old wine gallons, or 8½ imperial gallons, that is, 2310·62 cubic inches. This measure is also in use in various parts of Europe, and the comparison between the ankers of different places is in the table underneath. A full account of the other measures connected with it may be found in Kelly's *Cumbist*.

ANKARSTROEM (JOHN JAMES), a Swede, born in 1759, of a family then recently ennobled. He was placed in the king's guards as ensign, but left the service when only twenty-four years of age, having obtained the honorary or brevet rank of captain in the army; he then retired to his patrimonial estate in the country. He seems to have been early dissatisfied with Gustavus III. on account of the change that king had effected in the constitution of the country. At the Diet of 1772, Gustavus curtailed the power of the senate, or high nobility, who were till then possessed of an almost unlimited authority, and he was in this attempt supported by the other three orders, especially by the citizens and the peasants, who were tired of the irresponsible oligarchy of the senators; but the king having thus wrested the power from the nobles, took it to himself, and ruled almost absolutely. This caused as much dissatisfaction among the popular estates as his former measures had caused among the high nobility. (See **GUSTAVUS III.**) Ankarstroem, who did not himself belong to the high nobility, seems to have sympathised more in his political discontent with the popular orders against the absolute power attained by the king. He was accused of having spoken against the king before an assembly of peasants, and although the charge could not be proved against him, he was confined first in the castle of Wisby, in the island of Gothland, and afterwards transferred to other fortresses: he was, however, at last released. Ankarstroem was present at Stockholm in 1789, when the king, after suppressing the senate and arresting the most refractory members of the nobility, came in person to their Chamber, which he had previously surrounded with his soldiers in order to force them to assent to his innovations. Ankarstroem spoke with great vehemence, even in the king's presence, against the violation of the constitution, and his speech made a considerable impression on the assembly. The execution of colonel Hæstko, an officer of the army of Finland, who had opposed the king's orders and refused to act on the offensive against Russia, on the ground that the war had not been sanctioned by the estates of the kingdom, seems to have filled the measure of Ankarstroem's resentment against Gustavus. It appears that it was then that he first thought of murdering the king, without being connected with any other conspirators; but falling in afterwards with several disaffected nobles, among others counts Horn and Ribbing, he communicated to them his purpose, and they encouraged him in his determination. They first tried to seize the king at Gella, where he had convoked the Diet for 1792, but being thwarted in their design, they at last determined to strike the blow at a masked-ball where the king was to be present, on the 16th March, 1792. Count Horn agreed that he should point out the king among the crowd to Ankarstroem. Gustavus received an anonymous note warning him not to go to the ball, but he disregarded the advice, and went in a domino dress. As he was pacing down the hall, leaning on count Ersen's arm, Horn, followed by Ankarstroem, accosted the king, saying, "Good day, fair mask." At these words, which were the signal agreed upon, Ankarstroem fired a pistol loaded with two balls, and dangerously wounded the king in the thigh. He was not then recognized, and went out of the hall unmolested. After the assembly had dispersed, a pistol and a dagger were found on the floor. The armourer whose name was on them, deposed that he had lately sold them to Ankarstroem, who was then arrested in his house; on his first examination he was subjected to the torture, but he was afterwards tried before the ordinary tribunals. He acknowledged his crime, but denied having any accomplices. He, however, confessed that several persons knew of his determination. He was condemned to be publicly whipped with rods for three successive days, and then to be beheaded after having his right hand cut off.

The king had expired a few days after receiving the wound. Ankarstroem went to the scaffold with resignation; he was then only thirty-three years of age. Many other persons were arrested and tried; two of them destroyed themselves, but none were executed. Counts Horn and Ribbing, and colonel Lilientholm, were banished for life. The report of Ankarstroem's trial was published at Stockholm.

ANKLAM, a strong town of Hitler Pomerania, in Prussia, lying on the river Peene, twenty miles south-east of Greifswald. Its port enables it to carry on a brisk intercourse with other countries, and it possesses considerable manufactures of woollens, linens, leather, and tobacco. By the census of 1831, its population appears to have amounted to 6286.

Anklam is the capital also of a circle of the same name in the government of Stettin, which circle contains 22,500 inhabitants.

ANNA BOLEYN. [See **BOLEYN.**]

ANNA COMNE'NA, the daughter of Alexius Comnenus I., emperor of Constantinople, born Dec. 1, 1083, best known as the author of the *Alaxiad*, a work written in Greek, containing the history of her father's life. She was the favourite child of Alexius, and her talents were sedulously cultivated by an education comprehending the study of eloquence, poetry, mathematics, natural science, and the philosophy of Plato and Aristotle (see her preface to the *Alaxiad*); and the voice of loyal admiration soon pronounced that her acquirements surpassed those of her most skilful masters. She married Nicephorus Bryennius, a man of high birth, and of high literary attainments. Presuming on parental partiality, she solicited Alexius to name her husband for his successor, to the exclusion of her brothers, John and Isaac; and in this attempt she was assisted, if not mainly prompted, by her mother, the empress Irene. Pressed on this subject, the dying emperor uttered some allusion to the vanities of the world, which drew from Irene the unfeeling speech, 'You die, as you have lived, a hypocrite.' Alexius died Aug. 15, 1118, and John Comnenus, the lawful heir, possessed himself of the royal signet, and became master of the palace, and of the empire. Disappointed ambition drove Anna to conspire against her brother's life. All was prepared, but fear or remorse induced Bryennius to absent himself at the moment of action; and in her passionate disappointment the princess exclaimed, that 'nature had mistaken the two sexes, and endowed Bryennius with the soul of a woman.' On the discovery of the meditated treason, the life and fortune of Anna became justly forfeited. Her life was spared by the clemency of John, the best and greatest of the Comnenian princes; but her palace and treasures were confiscated, and bestowed upon a friend of the emperor who proved how well he deserved favour, by declining the gift, and interceding for the criminal. The guilty princess escaped with no further punishment than a forced retirement from the world, and exclusion from the splendour and intrigues of a court. Thus thrown on herself, she relieved the heaviness of her solitary hours by composing the *Alaxiad*, a history of her father's life and reign in fifteen books, from 1069, twelve years before he ascended the throne, to his death in 1118. She completed it in 1118, and died in the same year. The *Alaxiad* is distinguished by an air of filial piety both as regards the person and the fame of Alexius. Aware that she was exposed to the suspicion of partiality, she professes to have compared her own impressions, drawn from the intimacy of relationship, with all that had been said and written by the most competent judges. She describes herself as having lived in melancholy solitude for the last thirty years, without hope, and without fear, forgotten by the world and forgetful of it, and declares truth to be more dear to her than even her father's memory. But the internal evidence afforded by the style does not confirm these high pretensions. The book is overloaded by rhetorical display, and by the affectation and misplaced obtrusion of science. Individuality of character is lost in indiscriminate panegyric, and the likeness is rendered suspicious by the barefaced flattery of the portrait. The most curious and important part of Anna's history, as of her father's reign, is that which relates to the first crusade. It is often at variance with the Latin authorities, and on no point more so than on the character of Alexius. The comparison of these conflicting statements, with due allowance for the prejudices of each party, affords some chance of approximating to the truth.

The *Alexiad* forms a part of the collection of Byzantine

historians. The first complete edition of it was published at Paris, 1651, by the Jesuit, Poussines, with a Latin translation and glossary. It has been translated into French by the president Cousin. A series of valuable notes on it, by the learned Du Fresne, will be found at the end of the *Historia* of John Cinnamus, containing an account of the reigns of John and Manuel Comnenus. There is a German translation of the *Alexiad*, in the historical collection of F. Schiller, Jena, 1790.

ANNA IWANOWNA, empress of Russia, was the second daughter of the czar Iwan or John I., the elder brother of Peter the Great, and for some time his associate on the throne. She was born on the 8th of February, (O.S.) 1694. In 1710 she was married to Frederic William, duke of Courland, who died in 1711. On the death of the emperor, Peter II., on the 29th of January, 1730, without issue, it was pretended by the Dolgorouckis, who for some time had been the ruling favourites of the late monarch, that he had left a will appointing their sister, the princess Catherine Dolgoroueki, to whom he had been betrothed, his successor. The project of raising that lady to the throne, however, miscarried, in consequence, it is said, of a want of union among the heads of the powerful family by whom it had been contrived. The duchess dowager of Courland was elected by the council of state, the senate, and the principal military officers then at Moscow, who assembled in the Kremlin immediately after the emperor's death for the purpose of determining who should wear the crown. The object of the persons who composed this meeting unquestionably was to reduce the government of Russia to a limited monarchy, or rather, perhaps, to an aristocratical form. They did not, however, take their measures with either the good management or the boldness requisite for so great an undertaking. For the present they deemed it necessary to name a successor to the late emperor, and the duchess Anna was unanimously fixed upon, being, it is believed, indebted for this preference to her residence at so great a distance from the capital as would give the projectors of the revolution time to strengthen themselves in their position before she could make her appearance. Her elder sister, the duchess of Mecklenburgh, who was then in Moscow, was passed over on the pretence that she had forfeited her claim to the throne of Russia by having married a foreigner. The princess Elizabeth also, the daughter of Peter the Great, who afterwards became empress, was in the palace; but although her surgeon, on hearing of the death of the emperor, ran immediately to her chamber, and pressed her to present herself to the people and assert her title to the crown, she could not be prevailed upon to leave the room.

The Empress Anna, however, was not simply called upon to assume the vacant throne. Seven articles or conditions were attached to the invitation that was sent to her, to which she was required to give her consent before being permitted to reign. These conditions went to subject the crown entirely to the power of the nobility; and it was possibly calculated by their authors that Anna would at once reject them. To take her by surprise, all those present at the meeting were forbidden, under pain of death, to reveal to any one what had been done. One individual, however, the count Jagouzinski, defeated this scheme by sending a courier to the duchess, who, in spite of the guards placed on the road, contrived to reach Mittau, where she was, just in time to make her acquainted with what had taken place before the deputies from the council of state arrived. The advice sent by Jagouzinski was, that she should unhesitatingly promise whatever was asked of her, and leave the rest to him. She followed this counsel, and immediately set out for Moscow.

She arrived in the capital on the 20th of February. For a few days she dissembled her designs. But on the 8th of March, having previously made all the necessary arrangements to secure success, she assembled the council of state and the senate in the palace, at all the avenues of which her guards had been stationed with their pieces loaded, and displaying before them the papers which she had signed, declared her promises annulled as having been fraudulently obtained, and announced herself empress and autocrat of all the Russias, with the full authority and prerogatives which her ancestors had enjoyed. The revolutionary party, struck with surprise and consternation, acquiesced without an attempt at resistance; while by the people generally the intelligence of what had taken place was received with tumultuous rejoicings. Thus terminated the last of the only two at-

tempts to limit the royal power which are recorded in the history of Russia; the former, which was equally unsuccessful, being that which was made in 1613, on the election of the czar Michael Federowitz, the founder of the reigning house. The banishment of the Dolgorouckis, the dismissal of the council of state and the nomination of another, and the remodelling of the army, quickly followed these events. In January, 1732, the empress left Moscow and took up her residence at Petersburg.

One of the first acts of the new reign, after these domestic matters had been arranged, was to enter into a treaty with Denmark, with which power Russia had been in a state of hostility since the time of Peter the Great. Another treaty was also soon after made with Persia, by which several of the conquests of Peter the Great, which had been found only sources of expense to Russia, were restored to that power. About the same time an embassy arrived at Petersburg from China, being the first which had ever been sent from that country to any European court.

This peaceful policy, however, was soon interrupted. On the 11th of February, 1733, Augustus II. king of Poland died suddenly at Warsaw, and the three powers of France, Austria, and Russia, were immediately embroiled in a contest respecting the succession to the vacant throne. France supported Stanislaus Leszczinski, who had formerly been king, but had been deprived of his crown by the result of the great battle of Pultowa, in 1709; and the two other powers joined to bring about the nomination of the elector of Saxony, the son of the late sovereign, afterwards Augustus III. Before the end of the year Russia had marched a body of 20,000 troops into Poland; and on the 22d of February, 1734, the count Lacy, who commanded them, sat down before Danzig, which held out for Stanislaus. Field-marshal Munich soon after arrived and took the command; under whose conduct, notwithstanding all the efforts of the French to raise the siege, the town was forced to surrender on the 30th of June. Count Lacy was the following year sent into Germany to assist the emperor Charles VI. with a body of 10,000 men, who advanced as far as the Rhine, and were the first Russian troops which had ever been seen in the centre of Europe.

In the course of the same year an expedition was sent to the Crimea against the Tartars inhabiting the steppes between that peninsula and the Ukraine, who had long been in the habit of making incursions into the Russian territory. This led, in 1736, to hostilities with Turkey. The war was conducted by field-marshal Munich; and the principal operations of the first campaign were the capture of Perecop on the 1st of June, after a short attack, and of Azof on the 29th, after a siege of three months, by count Lacy. Various other places of less importance were also forced to surrender; and the Turks and Tartars were beaten wherever they showed themselves. The operations of the next season were on a larger scale. On the 13th of July the town of Oekzakow surrendered at discretion to the Russian troops after a bombardment of two days, the victors, however, being indebted for their speedy success to a fire which broke out in the town and threatened its destruction. A subsequent attempt of the Turks to recover the place was unsuccessful, after having cost them 20,000 men. In the course of this year also, Austria, in conformity with a treaty which had been concluded between the two powers, came to the aid of Russia in this new war. The operations of the emperor's troops, however, were as unfortunate as those of the Russian army were the reverse; and after the war had been continued in these circumstances for nearly two years longer, in the course of which time the most important event was the capture by marshal Munich of the town of Chockzin, on the 31st of August, 1739, Austria was compelled, on the 18th of September, in the same year, to conclude the treaty of Belgrade, by which she gave up Belgrade and Servia to Turkey; and in consequence Russia, whose troops had now passed the Pruth, was also a few weeks after obliged to make peace, and to restore to the Turks Oekzakow and all her other conquests, except Azof, the fortifications of which, however, it was stipulated should be destroyed. The year before the question of the Polish succession had been settled in favour of Augustus by the treaty of Vienna, concluded on the 18th of September.

The peace with Turkey was proclaimed at Petersburg on the 26th of February, 1740. Towards the end of September the empress was taken ill, and although no appe-

ensions were entertained at first, the attack soon assumed a serious form. When she found herself in this state, she proceeded to arrange the succession; and on the 18th of October, the prince Iwan, the son of Anthony Ulrick, duke of Brunswick, and the grandson by his mother of the empress's elder sister Catherine, being then a child only three months old, was publicly declared grand duke of Russia, and successor to the throne. This matter having been settled, the empress died on the 28th of the same month.

The empress Anna had a considerable share of the ability which has long distinguished the imperial family of Russia. The manner in which she conducted herself on coming to the throne showed great decision of character, and the success with which the affairs of the empire were managed throughout her reign may be taken as a general proof of her superior talents and judgment. She was not, however, a very popular sovereign, owing principally to the many acts of oppression which were perpetrated in her name by her favourite Biron, as he called himself, his true name being *Bieren*, a minion whom she had raised from a low condition to be gentleman of the chamber in her court at Courland, and whom, having brought him with her to Russia, she eventually forced the nobility of Courland to elect as their duke. Biron was really the ruler of Russia during the whole of the reign of Anne. On her death-bed, she also appointed this person regent of the empire, till her successor should attain his eighteenth year; but her signature to the paper, by which this disposition was made, is said to have been obtained partly by fraud and partly by force. Biron did not long enjoy his dignity, having before the end of the year been seized by a body of conspirators, and soon after banished to Siberia. In one important respect, Anna did something to reform the gross habits of the Russian court, namely, by discountenancing and putting down as far as she could the drunkenness in which both men and women had been accustomed to indulge. Only one nobleman, prince Kourakin, it is said, had her permission to drink as much as he pleased. The empress also, although there was a great deal of deep play at court, never would herself play for money. Her favourite amusements were music and theatrical entertainments. It was in her reign, in 1736, that the first Italian opera was played at Petersburg. In 1739, the famous palace of ice was built by her directions, on occasion of the marriage of prince Galitzin with a peasant girl, the newly-wedded pair, as a part of the frolic, being compelled to pass the night in one of the rooms, all the furniture of which, including the bed in which they slept, was of the same material with the building itself. A full and excellent account of this reign, and especially of the military events by which it was distinguished, has been given by the baron de Maunstein in his *Memoirs of Russia from 1727 to 1741*. An English translation of this work from the baron's manuscript was published in 1770, under the superintendence of David Hume.

ANNABERG, a town in the Erzgebirg (ore-mountain district) of the kingdom of Saxony, 2800 feet above the level of the sea, containing 5500 inhabitants. It has considerable manufactures of cotton-lace, bobbinet, and ribbons, and trades in silver, tin, cobalt, and marble, which it receives from the neighbouring mines and works. Annaberg has a handsome church, orphan asylum, and high school. It is about thirty-six miles south-west of Dresden.

ANNAGOONDEY. [See BISMAGHUR.]

ANNAL, a town on the right bank of the Euphrates, about 34° 15' N. lat., 41° 50' E. long., where the river makes a small bend to the north-east. Opposite the town is a line of cultivated islands. The town consists of a long, narrow, winding street, on the bank of the river, and at the base of the hills which here line the Euphrates. This narrow strip is occupied by the town, and has numerous date groves, which overhang the clay buildings. The town contains about sixteen mills, some for irrigating the grounds and others for grinding wheat. Annah contains the remains of four ancient castles, one of which is on the largest island; there are two mosques, and a beautiful minaret, eighty feet high. There is a manufactory of coarse cloth for Arab cloaks: much wool is prepared, and some cotton. The number of houses is about 1800. On the left, or west bank, the hills rise abruptly, and are without wood: the boat-passage is along this bank as far as the last and largest of the islands, opposite to which the modern town terminates, and the remains of old Annah, or the Anatho of Isidore, commence, covering the island and extending east-

ward for two miles farther along the left bank. Nitro is procured at Annah, or near it; and Tavernier says, that chalk is dug in many places. Annah has apparently always been a town of some importance from its position in the desert, and serves as a resting-place between Bagdad and Aleppo, and between Bosrah and Aleppo.

From Annah to Aleppo is a journey, at the ordinary rate of travelling, of about 106 hours, or 15 or 16 days; from Annah to Bagdad, across the desert of Mesopotamia, 5½ days. (*Itinerary of Isidorus Characenus*, in Hudson's *Minor Greek Geogr.*; Captain Chesney's *Report on the Euphrates*; *London Geog. Journ.*, vol. iii.)

ANNALS, in Latin *Annales*, is derived from 'annus,' a year. Cicero, in his second book, *On an Orator (De Oratore)*, chap. xiii., informs us, that from the commencement of the Roman state down to the time of Publius Mucius, it was the custom for the Pontifex Maximus, or high priest, annually to commit to writing the transactions of the past year, and to exhibit the account publicly on a tablet (*in albo*) at his house, where it might be read by the people. Mucius was Pontifex Maximus in the beginning of the seventh century from the foundation of Rome. These are the registers, Cicero adds, which we now call the *Annales Maximi*, the great annals. It is probable that these annals are the same which are frequently referred to by Livy under the title of the *Commentarii Pontificum*, and by Dionysius under that of the *ἡφα ἔδροι*, or *Sacred Tablets*. Cicero, both in the passage just quoted, and in another in his first book *On Laws (De Legibus)*, speaks of them as being extremely brief and meagre documents. It may, however, be inferred from what he says, that parts of them at least were still in existence in his time, and some might be of considerable antiquity. Livy only says that most of the contents of the Pontiffs' Commentaries were lost at the burning of the city after its capture by the Gauls. It is evident, however, that they were not in Livy's time to be found in a perfect state even from the date of that event (A.U. 363): for he is often in doubt as to the succession of magistrates in subsequent periods, which it is scarcely to be supposed he could have been, if a complete series of these annals had been preserved.

The word annals, however, was also used by the Romans in a general sense; and it has been much disputed among the critics what was the true distinction between annals and history. Cicero, in the passage in his work *De Oratore*, says, that the first narrators of public events, both among the Greeks and Romans, followed the same mode of writing with that in the *Annales Maximi*; which he further describes as consisting in a mere statement of facts briefly and without ornament. In his work *De Legibus* he characterizes history as something quite distinct from this, and of which there was as yet no example in the Latin language. It belongs, he says, to the highest class of oratorical composition (*opus oratorium maxime*).

This question has been considerably perplexed by the division which is commonly made of the historical works of Tacitus, into books of annals, and books called histories. As what are called his *Annals* are occupied with events which happened before he was born, while in his *History* he relates those of his own time, some critics have laid it down as the distinction between history and annals, that the former is a narration of what the writer has himself seen, or at least been contemporary with, and the latter of transactions which had preceded his own day. Aulus Gellius (*Noctes Attice*, v. 18) has stated this doctrine, which, after his manner, he has endeavoured to support by a reference to the etymology of the word history, from the Greek *ιστοριω*, properly to inquire in person.

It must be evident that this is quite an unfounded notion. Without attempting to define at present what history properly is, which will be more conveniently done under the word itself, we may venture to assume, that it does not mean merely memoirs of events by contemporaries. And it is equally clear that there is nothing in the term annals which should make it exclusively applicable to accounts of past ages. We doubt, if Tacitus himself ever gave the name of histories to any of his writings. If he gave either work a title at all, more probably he gave to both that of annals only. We rather think it will be found, that wherever he mentions his historical writings, he refers to them by this name. It is, at any rate, by no means certain that the common division either originated with him, or was even recognised by others of his own age.

Tacitus has himself in one passage intimated distinctly what he himself understood annals to be, as distinguished from history. In his *Annals* (commonly so called), lib. iv. cap. 71, he states his reason for not giving the continuation and conclusion of a particular narrative which he had commenced to be simply the necessity under which he had laid himself by the form of composition he had adopted of relating events strictly in the order of time, and always finishing those of one year before entering upon those of another. The substance of his remark is, that 'the nature of his work required him to give each particular under the year in which it actually happened.' This, then, was what Tacitus conceived to be the task which he had undertaken as a writer of annals, 'to keep everything to its year.' Had he been writing a history (and in the instance quoted above, he insinuates he had the inclination, if not the ability, for once to act the historian), he would have considered himself at liberty to pursue the narrative he was engaged with to its close, not stopping until he had related the winding up of the whole. But remembering that he professed to be no more than an annalist, he restrains himself, and feels it to be his business to keep to the events of the year.

It is of no consequence that on some other occasions Tacitus may have deviated somewhat from the strict line which he thus lays down for himself—that he may have for a moment dropped the annalist and assumed the historian. If it should even be contended that his narrative does not in general exhibit a more slavish submission to the mere succession of years than others that have been dignified with the name of historians, that is still of no consequence. He may have satisfied himself with the more humble name of an annalist, when he had a right to the prouder one of an historian; or the other works referred to may be wrongly designated histories. It may be, for instance, that he himself is as much an historian in what are called his *Annals* as he is in what is called his *History*. In that case all we can say is, upon any interpretation of the words that may be advanced (except indeed the foolish one proposed by Aulus Gellius), that one of the titles is wrong.

In lib. iii. cap. 65 of his *Annals*, Tacitus tells us that it formed no part of the plan of his *Annals* to give at full length the sentiments and opinions of individuals, except they were *signally* characterized either by some honourable or disgraceful traits. In chap. 22 of the treatise on Oratory, attributed to Tacitus, the author expresses his opinion of the general character of the style of ancient annals; and (*Annal.* xiii. 31) he carefully marks the distinction between events fit to be incorporated into annals and those which were only adapted to the *Acta Diurna*. [See *ACTA DIURNA*.]

The distinction we have stated between history-writing and annal-writing seems to be the one that has been commonly adopted. An account of events digested into so many successive years is usually entitled, not a history, but annals. The *Ecclesiastical Annals* of Baronius, and the *Annals of Scotland*, by Sir David Dalrymple (Lord Hailes), are well-known examples. In such works so completely is the succession of years considered to be the governing principle of the narrative, that that succession is sometimes preserved unbroken even when the events themselves would not have required that it should, the year being formally enumerated although there is nothing to be told under it. The year is at least always stated with equal formality whether there be many events or hardly any to be related as having happened in it. In this respect annals differ from a catalogue of events with their dates, as, for instance, the *Parian Chronicle*. The object of the latter is to intimate in what year certain events happened; of the former, what events happened in each year. The history of the Peloponnesian war by Thucydides has the character of annals. The events are arranged distinctly under each year, which is further divided into summers and winters. All political reflections are, for the most part, placed in the mouths of the various commanders on each side.

In the *Rheinisches Museum für Philologie*, &c., ii. jahrg. 2 heft. pp. 293, &c., there is a disquisition by Niebuhr on the distinction between History and Annals, in which he limits the latter nearly as has been done above. But the greater part of the paper is taken up in endeavouring to account for the definition given by Aulus Gellius, which is illustrated in a manner perhaps more fanciful and ingenious than convincing. There is a translation of it in the Sixth

Number (for May, 1833) of the *Cambridge Philologica Museum*.

It scarcely need be noticed that the term annals is popularly used in a very loose sense for a record of events in whatever form it may be written—as when Gray speaks of

'The short and simple annals of the poor.'

In the Romish Church a mass said for any person every day during a whole year was antiently called an annal; and sometimes the same word was applied to a mass said on a particular day of every year. (See Du Cange, *Glossarium ad Scriptores Medice et Infimæ Latinitatis*.)

ANNAGOONDEY. [See BISNAGHUR.]

ANNAMABOE, or ANNAMABOO, a town with a fort belonging to the English, on the Gold Coast in West Africa. It is ten miles east from Cape Coast Castle, and six miles east from the intervening Dutch fort of Nassau. In Mr. Bowdich's map (*Mission to Ashantee*) it is placed in 5° 3' N. lat. and 5° 40' W. long. The fort of Annamaboe is considered to be the strongest on the coast. It is of a quadrangular form, and is built on a low site close to the shore, the town surrounding it in the form of a crescent, and coming down to the sea on both sides of it. The direction of the coast here, it will be recollected, is nearly due east and west. The fort of Annamaboe is commanded by an officer who holds the next rank to the governor of Cape Coast Castle. According to Captain John Adams, in his *Remarks on the Country extending from Cape Palmas to the River Congo*, (8vo. 1823,) the population of the town then amounted only to 3000 or 4000 persons, most of whom, he says, had become opulent from the trade in gold and slaves, of which this fort had long been the chief mart. Some among them are described as acting by a sort of hereditary right in the capacity of gold-takers to all ships that arrive, that is, of functionaries whose business it is to manage all negotiations and bargains between the traders and the natives, and to be responsible for the quality of the gold, by a per centage on the amount of which their services are paid. Mr. Meredith, however, in his *Account of the Gold Coast*, (1812,) speaks of the place as having been formerly much more populous. In 1807, the inhabitants, who considered themselves as belonging by their position to the nation of the Fantees, took part with them against the Ashantees; in consequence of which both the town and fort were attacked by a vast body of the latter. About 10,000 of the inhabitants of Annamaboe, according to Mr. Meredith, being two-thirds of the whole, were slain on this occasion; and about 2000 more of them took refuge in the fort. The fort was held by a garrison of only about thirty men, and with difficulty withstood the assault of the immense host that encompassed it. A ledge of rocks extends in front of this town a few yards from the shore, which makes, Captain Adams says, a good break-water.

ANNAMOOKA, island of. [See ROTTERDAM.]

ANNAN. [See COCHIN CHINA.]

ANNAN, a town in Scotland, in the former stewardry of Annandale, and in the county of Dumfries, 79 miles S. of Edinburgh 15½ E. by S. of Dumfries, and 20½ W. by N. of Carlisle, 54° 59' N. lat., 3° 14' W. long. of Greenwich.

The town is situated on the river Annan, not far from where it falls into the Solway Frith. Over this river there was formerly a bridge of five arches, now replaced by a more modern one of three; the river is navigable for vessels of 250 to 300 tons, to within half a mile of the town, and for vessels of 60 tons up to the bridge, forming a good natural harbour. The road from Carlisle to Dumfries runs along the principal street, and there are small lanes or closes leading to the right and left, but the increased size of the place has caused some new streets to be built. The houses are, in general, good; some handsome buildings have been lately erected; and the town is paved, and has a neat and improving appearance. The manufactures carried on are of cotton and leather, but not to any great extent. The trade of the place is chiefly coasting trade: there being little foreign commerce, except the annual importation of a cargo or two of British American timber. The exports are grain, malt, potatoes, bacon, freestone, and Scotch timber: the imports, coal, lime, slate, timber, herrings, salt, colonial produce, and general merchandise from Liverpool and Whitehaven.* There is a freestone quay to enable vessels to take in or discharge their lading. There is a salmon fishery in

* See Appendix to Dr. Singer's *Agricultural Survey of Dumfriesshire* (Edinb. 1812), from which these particulars of the trade of Annan are chiefly taken.

the river, and the sea yields cod, turbot, and a variety of small fish. The rise of the tide on the coast is twenty-one feet.

The parish of Annan extends three miles along the coast, and eight miles inland, and had a population, in 1831, of 5033. It is intersected by the river. It yields a considerable quantity of potatoes, and contains quarries of freestone, limestone, and granite. The living is in the Presbytery of Annan and Synod of Dumfries, and in the patronage of the earl of Hopetoun. There is a flourishing academy lately established and endowed by the heritors and the burgh council.

Annan is thought to have been a Roman station. It was held in fief, with the whole territory of Annandale, by the ancestors of Robert Bruce. This family had here a stately castle, of which the ruins may still be seen. Upon the succession of the Bruces to the throne, Annan became a royal burgh, and it now returns a member in conjunction with Dumfries, Sanquhar, Kirkcubright, and Lochmaben. (Sinclair's *Statistical Account of Scotland*, &c.)

ANNAN, a river of Scotland, which rises in the mountain range that runs along the northern boundary of Dumfriesshire. It has a general southern course in a long narrow valley, into which a number of small lateral valleys open. The Moffat Water, which is the chief branch of the river, rises in Loch Skene, at an elevation of 1300 feet. The whole course of the Annan is perhaps about forty miles.

ANNANDALE, the district on the banks of the above river, and the middle division of the county of Dumfries. It formed, under the designation of the stewardry of Annandale, one of the three jurisdictions into which the shire of Dumfries was once divided: the others were the shire of Nithsdale and the regality of Eskdale. A stewardry was a district governed by a sheriff or *steward* appointed by the king.

ANNA'POLIS, a town in Maryland, on the south-west bank of the Severn, near its outlet into Chesapeake Bay, 38° 57' N. lat., 76° 27' W. long., and twenty five miles E.N.E. from Washington. Annapolis, though only an inconsiderable place with a population of about 2260, has been the seat of government for Maryland ever since 1699. The chief building is the state house. The total tonnage of the district of Annapolis up to December 31, 1831, was only 3172, enrolled and licensed, of which 332 was employed in the coasting trade. (*Report on the Commerce and Navigation of the United States*, 2d Congress, 22d Session.)

ANNA'POLIS, a county of Nova Scotia, in the north-western part of the province, bordering on the Bay of Fundy. It contains six townships, and returns five members to the provincial parliament. The first European settlement in Nova Scotia was made by the French in this quarter, in the year 1601, at the place where the town of Annapolis Royal now stands. The French settlement was called Port Royal, and was twice taken by the English, once in 1611, and again in 1710, by expeditions fitted out from the colonies of New England. On this last occasion, the name of the town was changed to Annapolis, in honour of Queen Anne; at the same time the province, which had been called Acadia by the French, had its name changed to Nova Scotia. Under this name it was ceded to England by France in 1713, and has since continued in British possession.

The town of Annapolis remained the seat of the provincial government until 1759, when, upon the founding of Halifax by Governor Cornwallis, the government offices were transferred to the new town.

The town of Annapolis, situated in 44° 40' N. lat., and 65° 37' W. long., is built on a peninsula formed where the two rivers, Annapolis and Allen, discharge themselves into Annapolis Bay. Since the building of Halifax, it has lost much of its importance. The government buildings and fortifications have fallen to decay, and the trade of the place is much diminished.

The river Annapolis, which rises in the township of Cornwallis, King's County, runs parallel with the Bay of Fundy for about seventy miles, and falls into that bay through Digby's Gut, having previously expanded into a wide estuary, called Annapolis Bay. The river is navigable for boats and small vessels through the greater part of its course. The population of the county, at the census taken in 1827, was 11,661. (Bouchette's *British Dominions in North America*; Monson's *Letters from Nova Scotia*; McGregor's *British America*.)

ANNA'TES, from 'annus,' a year, a sum paid by the person presented to a church living, being the estimated value of the living for a whole year. It is the same thing

that is otherwise called *Primitiv*, or *First Fruits*, under the last of which terms the origin and history of the payment will be treated of. We may merely mention here that the amount of the annates in each cure was formerly regulated, in England, by a valuation of benefices, made by Walter, bishop of Norwich, under the direction of Pope Innocent IV. in the year 1254, in the reign of Henry III.—that a new valuation was made in 1292, in the reign of Edward I. and a third in 1535, in the reign of Henry VIII., according to which last, commonly called the *Liber Regis*, or *King's Book*, the clergy are at present rated. These fines went formerly to the bishop or the pope; but on the king being recognized as head of the church at the Reformation, they were transferred to the crown. In the reign of queen Anne, however, they were given up in England to form a fund for the augmentation of poor livings. In Ireland, until the act of last session for the reform of the church, they were applied in the first instance to the repair of churches, and to the augmentation of poor livings after that object had been satisfied. By the late act the demand of first fruits is abolished in that country, and in lieu of it all ecclesiastical incomes above a certain amount are to pay yearly a tax regulated by their value. In Scotland, by an act passed by the parliament of that kingdom in 1672, the heirs or executors of every holder of a spiritual benefice are allowed the first half year's stipend after that to which the incumbent was entitled at the time of his death; and this is called the *Ann*, or *Annat*. As it belongs to the executors of the clergyman, and not to himself, it can neither be assigned by him during his life, nor seized in payment of his debts. [See *FIRST FRUITS*.]

ANNE OF AUSTRIA, queen of Louis XIII. of France, and regent during the minority of Louis XIV., occupies a prominent place in French history. Daughter of Philip II. of Spain, she became the wife of the young Louis XIII. in the year 1615. It is worthy of remark, that the will and policy of the great princes who have governed France have always been counteracted by their queens or female favourites, thus exemplifying the witty saying of Louis XIV.'s granddaughter, that when queens reign, men govern, and that when kings reign, women eventually decide the course of events. The great Henry IV. of France had for his darling project the humbling of the House of Austria. His queen, Mary of Medici, was averse to this policy, and no sooner was Henry in his grave than she took measures for a reconciliation with Spain, and sealed it by a double marriage, one of which was that of young Louis XIII. with Anne of Austria. The administration, however, fell in a few years into the hands of that master-spirit, cardinal Richelieu, who resumed Henry IV.'s views of humbling the pride and ambition of the House of Austria. In this he instantly found an enemy in Anne of Austria, and a struggle ensued betwixt them, in which Anne, though a queen, and a queen regnant, was compelled to yield, as long as he lived, to the great minister.

Had Anne been a woman of greater talents or more pleasing character, it might have been otherwise, but her Spanish education, her coldness and gravity of demeanour, which only covered frivolity of thought, alienated, rather than attracted Louis XIII. Upon this feeling Richelieu worked, and he was able at once to inspire Louis with dislike and with jealousy of his queen. Her natural attachment to her native country was another fault which the cardinal represented as a crime, and his whispers as to her betraying intelligence brought upon Anne the ignominy of having her person searched, and her papers seized by the jealous vigilance of officers commissioned by Louis himself. When it was generally known that the queen was in disgrace, and was the object of Richelieu's anger and mistrust, this was sufficient to rally around her the host of malcontent nobles, with Gaston, the king's brother, at their head; they were all jealous of the minister's ascendancy, and fearful of his schemes, which menaced the remaining independence of the aristocracy. It does not appear that Anne was more privy to their plan of resistance and rebellion than she could have avoided being. But her name was unavoidably implicated, and the artful cardinal made of this a specious tale for the king's ear. He represented Anne as disgusted with her royal husband, and endeavouring to get rid of him through conspiracy, in order to place Gaston, duke of Orleans, in his stead. Louis XIII. fully believed this malicious tale, and compelled his queen to appear at the council-table, there to listen to this grave charge from

the royal mouth. In such a situation, Anne's dignity of character came to her aid. She scorned to reply directly to such a charge, but observed contemptuously, 'That too little was to be gained by the change, to render such a design on her part probable.'

What gave most force to Richelieu's tale, was the court which the duke of Buckingham had openly paid to the queen of France. Madame de Motteville, Anne's attendant, who has written the memoir of her life, gives a circumstantial account of the arrogant passion of Buckingham, and confesses that the suit of the English duke pleased the queen's vanity, if it did not touch her heart. On one occasion, after having taken leave on his return to London, he hurried back from Amiens, found his way into the queen's sleeping-room, where it was usual for her to receive visits, flung himself on his knees by the bedside, and gave full vent to a passion that shocked the attendants, as passing beyond the bounds of etiquette. Anne gave but a gentle reprimand. Neglected by her husband (who partook not of her bed for twenty-three years after their marriage), Anne was not insensible to the chivalric attachment of a noble and a statesman, and might perhaps have given some handle to malicious insinuation. At all events, she remained without influence, alienated from the king's affections and council, till death took away monarch and minister, and left to Anne, as mother of the infant monarch, the undisputed reins of power.

There was then a change of policy similar to that which had taken place on the death of Henry IV. Mary of Medicis had counteracted and abandoned all his schemes for humbling Austria, by making peace with that rival power. Anne, of Austrian blood, now did the same, from hatred to Richelieu's memory, as much perhaps as from family affections. She did this with less abruptness, indeed, than Mary, having the good fortune and good sense to have and to choose for her minister a man bred in Richelieu's school, one who had learned his address, but who had never been endowed with his disinterestedness and high views. This was Mazarin. Anne's selection of such a man for minister is the greatest proof of her discernment. As a foreigner, he was completely dependent on the hand that raised him; and consequently there was less danger of his becoming ungrateful, as Richelieu had been to Mary of Medicis. For the same reason, he was unconnected with any powerful party, and the queen made full use of his abilities, without being in danger from his ambition.

Anne of Austria's policy in this choice, though perhaps the wisest, was still not the less fraught with danger. It alienated from her at once the party of the noblesse, which, crushed by Richelieu, had made common cause with Anne in her disgrace, and now raised its head to claim vengeance and spoil. Amongst them were even the queen's peculiar friends, the duke of Beaufort, who was a kind of favourite, and the duchess of Chevreuse, the bosom companion of Anne. Mazarin's advice compelled his mistress to resist the unreasonable demands of these, her former partizans; and the consequence was a general conspiracy against the queen and her minister. Beaufort was sent to prison, and madame de Chevreuse again exiled. Mazarin, like his predecessor, might have triumphed over the noblesse alone; but this class now called to its aid a new, and hitherto neglected body, that of the citizens, or burghess-class. These were easily inflamed against Mazarin as a foreigner, and as a financier, fertile in the invention of new taxes. In addition to this, the great offices of the judicature, which had become venal, had fallen into the hands of the middle or citizen-class, and the magistracy, being possessed of the power of sanctioning or resisting the royal edicts, made common cause with the citizens, and thus a powerful combination was raised against the authority of Anne. An attempt on her part to treat the magistrates as she had treated the duke of Beaufort, by imprisoning them, gave birth to a popular insurrection, which proved successful. The queen and court were for a time prisoners in the Palais Royal, and compelled to submit to the dictates of the mob. The Spanish pride of the queen was with difficulty induced to submit to necessity. She threatened at first to fling the heads of the captive magistrates to the mob, rather than deliver their persons, and her indignation at the time provoked a powerful enemy in the future cardinal de Retz. But she was compelled to smother both pride and anger. The people had their will. The court, however, took the first opportunity of escaping from Paris

and recurring to arms. A civil war commenced between Anne, her minister, and their adherents on one side; and the noblesse, the citizens, and people of Paris on the other.

One might think that the advantage in such a quarrel must necessarily remain to the latter. But Anne and Mazarin's address, after many vicissitudes of fortune, came off triumphant. First they rallied a considerable portion of the army, and the king's name was to them a tower of strength, which enabled them to resist the formidable rebellion of the capital. The *Frondeurs* too, as the insurrectionists were playfully called, were not very earnest in their rebellion. There was no enthusiasm, no fanaticism. The resistance was rather the effect of momentary impatience and despatch, which vented itself in epigrams more than in deadly missiles. The young noblesse considered the campaign as a frolic, and however the citizens and magistrates might wish to obtain a certain measure of political freedom, similar to that for which England had so lately struggled, it was evident that the nobles looked with no favour on such schemes, and would eventually concur to mar them. Seeing this, the magistracy determined to bring about an accommodation. It was no easy task. A suspension, or rather a cessation of hostilities, was produced by the retirement of Mazarin.

He returned, however, for Anne was but a cypher without her minister; and the war again broke out. The court had secured a defender in Turenne, who triumphed even over all the valour of the young noblesse, headed by the great Condé. The result of the rebellion, and of Anne of Austria's administration, was, that the nobles and middle classes, vanquished in the field, were never afterwards able to raise their heads, or to offer resistance to the royal power, up to the period of the great revolution. Louis XIV. is, in general, said to have founded absolute monarchy in France. But it was rather the blunders and the frivolity of those who idly espoused the cause of freedom during that monarch's minority which produced this effect. Anne of Austria's triumph was that of monarchy. She, or at least the events of her regency, contributed far more to it, than all the subsequent imperiousness of Louis XIV.; and hence the epoch of Anne's administration is one of the most important in French history.

Anne must have been of pleasing exterior, as not only the account of M. de Motteville, but her portrait in the Vienna gallery, testifies. That she was unchaste does not appear, notwithstanding all the accusations of her story-telling times. Though not a woman of talents, she was at least fortunate in her regency; above all, in her choice of Mazarin. Her influence over the fate and the court of France continued for a long time; her Spanish haughtiness, her love of ceremonial, and of all the pride of power, were impressed by education upon the mind of her son, Louis XIV., who bears the blame and the credit of much that was hers. Anne of Austria died at the age of sixty-four, in the year 1666.

ANNE, queen of England, the second daughter of James II. by his first wife Anne Hyde, was born at Twickenham on the 6th February, 1664. She was educated in the religion of the Church of England; and, in 1683, was married by the bishop of London to prince George, brother of Christian V., king of Denmark. At the revolution in 1688, Anne and her husband adhered to the dominant party of her brother-in-law William III.; and, by the act of settlement, the English crown, in default of issue to William and Mary, was guaranteed to her and her children. During the

reign of William she appears to have lived in much discomfort, neglected by her sister, and treated with coldness by the king; and she sustained the heavier affliction of losing all her children in infancy, except one son, the duke of Gloucester, who died at twelve years of age, in 1699. This event, as well as the previous death of queen Mary, rendered an alteration in the act of settlement necessary; and the princess Sophia, dowager electress of Hanover, and her descendants being Protestants, were declared next heirs to the throne, in default of direct heirs to William and his sister-in-law Anne. [See SETTLEMENT, ACT OF.] The exiled king James II. died on the 16th November, 1701; and Louis XIV. of France having recognised the claims of James's son to the English throne, William III. commanded the return of his ambassador from France, and dismissed the French ambassador from England. Another cause of hostility between France and England had arisen in the recognition by Louis XIV. of the claim of his grandson, Philip of Anjou, to the crown of Spain. The PARTITION TREATIES between France, England, and Holland, in 1698 and 1700, had otherwise regulated the succession of Spain: the first treaty declaring Joseph Ferdinand, electoral prince of Bavaria, presumptive heir; and the second, upon the death of Joseph Ferdinand, declaring the archduke Charles presumptive heir. The will of Charles II. of Spain, who died November 1, 1700, by giving the crown to Philip of Anjou, had materially disturbed the balance of power in Europe established by the PEACE OF RYSWICK in 1697; and the recognition by France of this testamentary disposition, in violation of the partition treaties, united, in 1701, England, Holland, and other European powers, in the determination to resist an arrangement which seemed to bestow such a formidable preponderance upon the French monarchy. [See HAGUE, ALLIANCE OF.]

Under these circumstances, Anne ascended the throne, upon the death of William III., on the 8th March, 1702. The hostility between the whig and tory faction at home, which went on increasing in violence to the end of the reign of Anne, was in its commencement greatly mitigated by the united opinion of the country as to the justice and policy of the war with France and Spain. On the 11th May, within two months after Anne had succeeded to the throne, war was declared by England, the Empire, and Holland, against these powers. The general progress of this memorable war will be detailed under the head SUCCESSION, WAR OF. The extraordinary campaigns in the Low Countries and Bavaria, by which the military glory of England was raised higher than at any period since the days of Edward III., will be described in the life of MARLBOROUGH; the brilliant successes of the English arms in Spain under lord PETKHOBOUGH will be found in the notice of that singular commander; and the naval exploits of this war, of which the most signal examples were the capture of GIBRALTAR and PORT MAHON, will be found in our accounts of those places; and in the biographies of the English admirals, LEAKE, ROOKE, SHOVEL, and STANHOPE.

The legislative union of Scotland and England, completed on the 27th July, 1706, was one of the most important events in the reign of Anne, of which the progress and consequences will be detailed in their proper place, SCOTLAND, UNION OF.

During the brilliant course of Marlborough's conquests, the spirit of political intrigue, which was perhaps never more fully developed than in the latter years of the reign of Anne, was stifled by the enthusiasm of the people. But as the war of the succession proceeded with few indications of its being brought to an end, the great commander of the English forces gradually lost his popularity, from the belief that his own avarice and ambition were the principal causes of the burdens which the war necessarily entailed upon the nation. A formidable party, too, had arisen, who asserted the supremacy of the church and the doctrine of the right divine of kings and the passive obedience of subjects—opinions which had expelled James II. from his kingdom, and had placed his childless daughter upon the throne. These opinions, however, were supposed to be indirectly encouraged by the queen, and were exceedingly popular amongst a passionate and unreasoning people. The impeachment of Dr. SACHVEREL for preaching these opinions,—his mild punishment, which had the effect of a real acquittal,—and his subsequent triumphant progress through the kingdom, and an unerring presage of violent changes. In the year 1710 the tory supremacy was established. The

duchess of MARLBOROUGH, to whose talents and decision of character the queen had long submitted, was thrust out by the new favourite, Mrs. MASHAM. The ministry of GODOLPHIN and SUNDERLAND was displaced by that of BOLINGBROKE and OXFORD. The command of the army was taken from Marlborough and bestowed upon the duke of ORMOND. During the progress of these convulsive changes, which must have been distracting enough to the quiet temper of Anne, she was deprived of the sympathy of her placable husband. Prince GEORGE OF DENMARK died on the 28th October, 1708.

The first act of the tory ministry was to enter upon arrangements to bring the war to a conclusion. In 1711 negotiations were entered into with France, amidst the protestations of the allies of Great Britain, and these negotiations, after various difficulties, were terminated by the memorable treaty of April 11, 1713. [See UTRECHT, PEACE OF.]

By the treaty of Utrecht the succession to the crown of Great Britain had been guaranteed to the House of Hanover. But a suspicion began soon to prevail that the queen and a portion of her government secretly favoured the pretensions of the son of James II. The minority in parliament attempted to carry several measures which would bring these supposed partialities to a test. The queen was compelled to invite the Electress of Hanover to England; and upon the death of that princess in June, 1714, to issue a proclamation offering a reward for the apprehension of her brother should he attempt to land in Great Britain or Ireland. It is affirmed by a writer in the *Biographic Universelle*, upon the authority of some secret memoirs, that the son of James II. at this juncture clandestinely visited England, and in an interview with his sister concerted measures for defeating the Hanoverian succession. The tory ministry was, however, shattered by the quarrels of Oxford and Bolingbroke; the whigs carried the nation along with them in their denunciation of the peace of Utrecht, which had left the country little besides a barren glory; and the dissatisfaction with the union of Scotland threatened to break out in open insurrection. The health of the queen gave way under these distractions. On the 20th July, 1714, she prorogued parliament for a month, and falling almost immediately after into a state of weakness and lethargy, died on the succeeding 12th of August. It is said that her last words were an expression of pity for her brother.

The reign of Anne has been called the Augustan age of English literature. It produced Addison, Arbuthnot, Congreve, Pope, Prior, Steele, and Swift, writers of a high degree of excellence in their particular walks, but scarcely to be compared with the great poets of the reign of Elizabeth, or with a few other illustrious names of a succeeding generation, such as Milton and Dryden.

ANNEALING. There are certain substances, more especially glass and some of the metals, which on sudden cooling after having been melted, acquire great brittleness, and in the case of glass, a disposition to fly to pieces by moderate changes of temperature, or slight external force. This is remedied by annealing, which, with respect to glass, consists in heating it, below the point at which it softens, in what are termed *annealing ovens*, the glass being gradually removed from the hotter to the cooler parts of the furnace. The brittleness of glass has been attributed to the disturbance, attendant upon the hasty cooling, in the regular arrangement of its particles. [See GLASS.]

The metals also suffer remarkable changes as to their hardness, toughness and brittleness; this is especially the case with iron after it has been converted into steel. The alteration of structure which they undergo is not thoroughly understood; it is, however, certain that some malleable metals which crystallize on cooling, are brittle in their crystalline state, and that this structure is altered, and they are rendered tough by heating and rolling. This is remarkably the case with zinc, which is incapable of extension under the hammer, except in a slight degree, without cracking; but when it has been passed through the rollers, at a moderate increase of temperature, it becomes almost as flexible and as tough as copper. This change must be derived from some alteration of structure, and fresh arrangement of the particles, which must be considered as owing to a process, if not identical with annealing, yet bearing a strong analogy to it. [See BRASS and STEEL.]

ANNECY, an episcopal city of Savoy, on the north bank of the Lake of Annecy, stands at the extremity of a beautiful

plain surrounded by delightful eminences and lofty calcareous mountains, and at an elevation of 1456 E. feet (Saus-sure) above the level of the sea. It is 22 miles N.N.E. of Chambéry. Annecy is the principal seat of manufacturing industry in Savoy, and has between 5000 and 6000 inhabitants, with establishments for cotton-spinning, calico-printing, and a glass-house. Some iron-mines are worked in the neighbourhood.

The Lake of Annecy washes the edge of the town. Its greatest length is about nine miles and a quarter, and its average width three. The greatest depth is 196 E. feet. This lake discharges itself by several canals, said to be Roman work, all of which unite just beyond the town of Annecy in one stream, called the Thion, which empties itself into the Fier, a tributary to the Rhone.

ANNE'LIDA (Cuvier), an extensive division or class of animals, established by modern naturalists partly at the expense of Linnæus's heterogeneous class of worms (*vermes*). It was Baron Cuvier who first proposed to distinguish the annelida in 1802, chiefly on account of their blood being of a red colour, as in the leech, and circulating by means of a double system of complicated blood-vessels.

The name is derived from the Latin word *annulus*, a ring, because the animals arranged under this division always have their bodies formed of a great number of smaller rings, as in the earth-worm. Their external covering, or skin, is soft and pliable, and their bodies, having no bony skeleton, are soft, and in general more or less of a cylindrical form.

The annelida are for the most part oviparous, but the leeches and earth-worms deposit what are termed capsules, or membranous cocoons, containing many embryo young.

There is little variety in their mode of life. Some live in fresh and others in salt water; and others, like the hair-worm (*Gordius*), are amphibious. Some species construct tubes in the interior of stones, or in shells, which they perforate, or in madrepores. Some species again form calcareous cases, or cement around them various foreign substances, particularly sand. The sedentary species are timid, and when taken from their retreats can neither escape nor defend themselves. The *Errantia*, on the other hand, are frequently very nimble, and can defend themselves well by means of their bristles.

The researches of Baron Cuvier and M. Savigny did much to produce a clear arrangement of the animals under notice according to their physiological structure; and hence MM. Audouin and Milne Edwards, who have more recently investigated the structure of many species, have in part adopted the classification, slightly modified, of those naturalists. They make four divisions, groups, or orders, each differing in structure and in manners—the *Errantia*, the *Tubicola*, the *Terricola*, and the *Suctorio*.

The *Errantia* (*Nereide*, Savigny, *Dorsibranchia*, Cuvier) are, with few exceptions, essentially fitted for walking or swimming, and are rarely sedentary. They have in general a head distinct from the body, with antennæ and eyes. Their mouth is furnished with a protractile tube, more or less distinct, and in general with jaws.

The *Tubicola* (Cuvier) are essentially sedentary, and live almost uniformly in the interior of solid tubes, which their structure forbids them to quit. Their respiratory organs are usually observable on a certain number of the segments of their bodies, commonly at the anterior extremity. The feet are distinct, though short, and always armed with hooks as well as bristles. The head is not distinct, and they have no eyes, antennæ, nor jaws.

The *Terricola* always live in a hole or gallery in the ground, and are without feet, instead of which they have some short bristles to aid their movements. They have no distinct head, eyes, antennæ, or jaws. The mouth is always terminal, and sometimes furnished with tentacles.

The *Suctorio* differ from all the preceding in having neither feet nor bristles, and by being furnished at each extremity of the body with a prehensile cavity or sucker. They have no distinct head, but may almost always be observed to have eyes and jaws. They are chiefly parasites, and live at the expense of other animals.

ANNIBAL. [See HANNIBAL.]

ANNIUS of Viterbo, a well-known Dominican monk, who lived in the fifteenth century. His real name was Giovanni Nanni, but in conformity with the custom of the age he Latinized it, and dropped the first letter, in order to render it more completely classical. He was born at Viterbo, in 1432, and died in 1502. He entered early into the

Dominican order, and became famous for his acquaintance with the Eastern as well as the Greek and Latin languages. His works are voluminous: the most remarkable is entitled *Antiquitatum Rariorum Volumina XVII.*, cum *Commentariis Fr. Joannis Annii Viterbiensis*, in folio, Rome, 1498, several times reprinted. This collection professes to contain a number of historians of high antiquity, Berosus, Manetho, Mysilus the Lesbian, Fabius Pictor, Marcus Cato, and others, whose works, hitherto unknown, he professed to have discovered at Mantua. That these pretended historians were forgeries, there can now be no doubt; whether Annii was deceived or the deceiver, whether he forged them himself, or suffered from credulity and want of penetration, is a matter on which authorities are divided, and which it is of little moment to discuss now. He published two other works which excited a great sensation from the circumstances of the times, and the recent capture of Constantinople, one entitled *Tractatus de Imperio Turcorum*, the other, *De Futuris Christianorum Triumphis in Turcos et Saracenos ad Xystum IV., et Omnes Principes Christianos*, being the substance of a set of sermons preached by him at Genoa on the Apocalypse. (*Biog. Universelle*; see also Bayle and Moreri.)

ANNIVERSARY, the yearly return of any remarkable day, called, in old English, by the expressive term year-day.

Anniversary days are festivals celebrated by the Romish church in honour of the saints, one or two of whom are assigned to every day in the year. The long catalogue of saints being unknown to the church of England, anniversary days are not generally made a matter of religious observance. Some few days, unconnected with religion, are however still noticed. The birth-day of the reigning monarch is very generally celebrated by holidays and rejoicings: the anniversary of the Gunpowder Plot has been rescued from oblivion by the love of school-boys for fire-works and the pageant of Guy Fawkes; and the oaken bough still preserves the remembrance of the restoration of the Stuarts.

Literary and scientific associations generally celebrate the anniversary of their original institution, and social parties are still held in domestic life on the birth-days of heads of families; with these exceptions, the observance of particular days has greatly declined in England.

ANNO. [See HANNO.]

ANNO BOM, the smallest and most southern of the four islands in the bight of Biafra, is about four miles long and two broad. It is mountainous, and rises abruptly from an unfathomable depth to the elevation of near 3000 feet; but with the exception of one precipitous mass, the heights are of a rounded form. The ascent to this peaked summit is very steep and dangerous, owing to the looseness of the numerous stones which cover the side of the slope, and are in a state of decomposition. At the foot of this height is a small shallow lake, about three-quarters of a mile round, with a bottom of stiff bluish clay: the water was found to be very sweet.

The regular winds are from the S.W.: less rain falls here than in the other islands of the bight; the rainy season is confined to April and May, and October and November. The precise character of the climate as to health seems still doubtful. This island is chiefly visited for supplies of sheep, goats, pigs, fish, cocoa-nuts, bananas, lemons, Seville oranges, &c. Fowls are scarce. There is plenty of water on the island, but the heavy surf on the shore makes it difficult to procure. The population is about 3000, who live chiefly in a large village near the north-east point of the island, off which is the only tolerably safe roadstead for shipping round it. The natives are quite harmless. Their houses, which are small, are rudely constructed of rough boards, grass, mud, and the foot-stalks of the cocoa-nut tree. This island was discovered by the Portuguese in 1473, but is now governed by a native of the island, who is totally independent of the Portuguese, but appears to have no great authority.

Anno Bom lies in 1° 24' S. lat., and about 6° E. long.; but we are not able to state its longitude accurately. Cape Lopez is the nearest part of Africa to Anno Bom. (From *Memoir descriptive of Prince's Island and Anno Bom*, by the late Captain Boteler, R.N. *London Geog. Journal*, vol. ii.)

ANNONAY, a town in France near the northern extremity of the department of Ardèche, at the junction of two rivers, the Diaume (or Dfom) and the Canche, whose united streams flow into the Rhone, from the right bank of which Annonay is only five or six miles distant. The town

itself, which is neither large nor handsome, stands on the tongue of land between the two streams above-mentioned, by which it is separated from its suburbs. It is celebrated for its paper, which is considered the best in France; and it also has manufactories of cloths, silks, cotton, wax, and leather. It is the busiest town in the department, and its population has risen with great rapidity until it has surpassed that of any other place in Ardèche. In the *Encyclopédie Méthodique*, (published in 1782) it is called "petite ville," (a small town,) in the *Dictionnaire Universelle de la France*, (1804,) the inhabitants are given at 3800; but the latest authorities (MM. Brun and Balbi) raise it to 8000. It is about thirty-four miles in a straight line north of Privas, capital of the department.

Ammonay was the birth place of Mongolfier the aéronaut, and of the Count Boissy d'Anglais; to both of whom monuments have been erected by their townsmen.

ANNUAL REGISTER. The earliest English publication which has any claim to be considered as an *Annual Register* is Edward Chamberlayne's *Anglicæ Notitia, or the Present State of England*, which first appeared in 1668, and continued to be annually republished with the requisite alterations till the year 1703 inclusive. But this work, as its title indicates, presented merely an account of the country in its existing state, with lists of public functionaries, &c., and gave no register of occurrences. Our first history of the year, we believe, was that given in the *Political State of Europe*, which was begun in 1711 by Abel Boyer, a French refugee, and the author of the well-known *French and English Dictionary*. This publication was continued till the year 1739. Although this work appeared also in annual volumes, it was really published in monthly numbers. In 1716 was commenced the *Historical Register*, a quarterly publication, which in like manner was republished in volumes at the end of each year. The regular publication having taken up the history of public affairs only from the 9th of January, 1716, two volumes were printed together in 1724, containing an account of events from the last day of July, 1711, up to that date, being the first seventeen months of the reign of George I. With these introductory volumes, therefore, the *Historical Register* forms a chronicle of the affairs of this and other countries of Europe from the accession of the House of Hanover. The compilers, to use their own words, confine themselves to mere 'matters of fact, without making any descent thereon either of commendation or reprehension.' This work also, about the year 1737, began to appear in monthly numbers. The change was probably a dying effort, as the volume for 1738 was, we believe, the last that appeared. The *Historical Register* was printed and sold by G. Merre in the Old Bailey. The price, while it was published quarterly, was one shilling each part.

The first *Annual Register*, properly so called, which appeared in this country, was the well-known and valuable work which still continues to be published under that title. This work was projected by Robert Dodsley, the bookseller, in conjunction with Edmund Burke, who was already well-known in the literary circles of the metropolis as the author of the *Essay on the Sublime and Beautiful*, the *Vindication of Natural Society*, and other anonymous works. The first volume of Dodsley's *Annual Register* appeared in June, 1759, under the title of *The Annual Register, or A View of the History, Politics, and Literature of the Year 1758*, printed for R. and J. Dodsley, in Pall-Mall. In the Preface are enumerated the several points of novelty in respect of which the work is conceived to have an advantage over its predecessors; and of these the first-mentioned is that it is an annual, and not a monthly publication. Others are, that it takes up the history of the war in which the country was then engaged, from its commencement in 1755; that it contains a collection of state-papers, illustrative of the historical narrative; and that, by its miscellaneous department and its notices of new books, it unites the plans of the magazines and reviews. The history in this volume consists of seventy-six pages divided into thirteen chapters, the first seven of which, running to thirty-two pages, are occupied with the first three years of the war. Then follow in order the chronicle, extending to sixty-seven pages; the collection of state-papers; characters; extraordinary adventures, including an account of the sufferings of the persons confined in the Black Hole at Calcutta in June, 1756; literary and miscellaneous essays; poetry, including pieces by Akenside, William Whitehead, and the king of Prussia; and lastly,

an account of remarkable books published in 1758, among which are Jortin's *Erasmus* and Walpole's *Royal and Noble Authors*. The volume consists of 496 pages in all, besides Preface, Contents, &c. This and several of the succeeding volumes were so popular that they quickly ran through five or six editions. There is no doubt that, for some years, the historical narrative was written by Burke, who also probably edited the publication and selected the rest of its contents. He appears to have been paid for his services at the rate of 100*l.* the volume. Mr. Prior, in his *Life of Burke*, has given engraved fac-similes of two receipts signed by him for two sums of 50*l.* paid to him by Dodsley for the *Annual Register* of 1761, the first dated on the 28th of March in that year, and the second on the 30th of March in the year following. This volume was not published, as appears by the preface, till a later period than usual in 1762. These receipts are in the possession of Mr. Upcott of the London Institution. Burke took a great interest in the conduct of the *Annual Register* almost as long as he lived; and Mr. Prior states that much of it was written from his dictation for about thirty years. Latterly it was written by a Mr. Ireland under his direction. It is generally believed that the work again received occasional contributions from Burke after the breaking out of the French revolution; and certainly some of the volumes belonging to that period are written with remarkable ability. To the departments above enumerated were afterwards added others of natural history, useful projects, and antiquities; together with lists of promotions, marriages, births, deaths, and patents; but some of these heads have been since discontinued. The difficulty of bringing out the work within six months of the close of the year appears to have been very early felt. In volume third the *Chronicle* has, for the first time, a different paging from the *History*, according to the plan which is still followed, having, as is stated in the preface, been put to press before the *History* was ready, in order to expedite the publication. The work, however, gradually fell into arrear, and at length, instead of some months, it was nearly as many years after the events had taken place till their history appeared. The publication was in this state about the year 1780. Great exertions, however, were soon after made by the conductors to recover their lost ground; on one occasion, two years, 1781 and 1785, were compressed into one volume, the 27th; and early in 1801 they had the satisfaction of publishing the volume for the year immediately preceding; thus closing the century with the work completed up to that date. Since then the publication has proceeded regularly at the rate of a volume each year. That last published, being the *Annual Register* for 1832, is the 74th of the series. Of the older volumes, several have been reprinted of late years in order to complete sets. An index to the work, from its commencement to the year 1780 inclusive, was published soon after the completion of the volume for that year, and has been several times reprinted; and in 1820 a second index appeared, comprehending the former, and embracing also all the additional volumes up to that for 1819 inclusive.

In 1781 was published the first volume of the *New Annual Register*, containing the history of the preceding year. It was projected and originally edited by Dr. Kippis; after whose death, in 1795, it was conducted by the Reverend Thomas Morgan, LL.D., the coadjutor of Dr. Aikin in the preparation of his *Biographical Dictionary*. Watt, in his *Bibliotheca Britannica*, states that this publication was at one time edited by the late Mr. John Mason Good; but we do not observe that this is mentioned in Dr. Olinthus Gregory's life of that gentleman. The *New Annual Register* was continued till 1825, but it never attained the reputation of its predecessor and rival.

The *Edinburgh Annual Register* was commenced in 1808, and was continued at least till 1825. We believe it is no longer published. Some of the earlier volumes of this work were written by Sir Walter Scott and Mr. Southey; and it was throughout conducted with great ability.

Other works of this description are the *Annual Asiatic Register*, begun in 1799; the *Baptist Annual Register*, first edited by the late Dr. John Rippon; the *Historical, Political, and Literary Register* for 1769, published in 1770; and the *Imperial and County Annual Register* for 1810, in 2 vols. 8vo. 1811. The two last mentioned seem to have been dropped after the first year.

A French work, in imitation of the English *Annual Registers*, was commenced at Paris in 1818, under the title of

Annuaire Historique Annuel; and there is also the *American Annual Register*, published at New York.

ANNUALS. By this name gardeners designate all plants which, if sown in the spring, will flower, perfect their seed, and perish in the course of the same season; if two seasons are generally requisite for this purpose, they then call plants biennials—but in fact they are both of the same nature: annuals, if sown in the autumn, become biennials; and the latter, if sown early in the spring, will go through every stage of life in the same year; the only difference between them is, that biennials are rather longer in completing the term of their existence than annuals are.

Physiologically considered, such plants belong to a much more extensive body of vegetables than is usually supposed. Plants may be said to consist of two kinds, those which perish after once producing their fruit, and those which continue to grow and produce fruit year after year. To the first of these classes belong not only annual and biennial herbs, but also many palms, the agave, and several other monocotyledonous trees.

The usual method of multiplying annuals is by their seed. It is, however, possible to dispense with this mode, and to perpetuate them by cuttings, care only being taken that the part used for a cutting is not in a flowering state; in this way the fugitive beauties of such plants as balsams and the like may be perpetuated. Even cucumber and melon plants may be renovated when in the last stage of decay by their young branches being cut off and made to put forth roots; and the different races of cabbages, the qualities of which can scarcely be preserved by the precarious plan of seed-saving, may be carried forward from year to year. (See *Gardener's Magazine*, vol. ix. p. 226.)

Gardeners distinguish annuals into two kinds, hardy and tender: the first comprehends all those which will grow if their seeds are sown at once in the open border; the last consist of such as require to be raised in artificial heat. The management of both these is so simple and well known that little requires to be said upon the subject: there are, however, two or three points that deserve to be particularly adverted to. The seeds of hardy annuals are apt to be destroyed by birds, or to be scorched up by a continuance of dry weather; both these accidents may be prevented by inverting over the patch in which they are sown a common flower pot: this should be examined daily, and as soon as the plants are found to be making their appearance, it should be elevated a little by resting its rim on two or three pebbles, so as to admit air and light. After a little while the plants will be fully established, and the pots may be removed.

Two things only are to be observed in the management of tender annuals beyond the ordinary practice of every gardener. Firstly, they should not be raised in a very high temperature if they are afterwards to be planted in the open air; and secondly, the seedlings should never be transferred from the seed-pan at once to the open ground, but should always undergo the intermediate operation of being transferred into small pots. Very great care should be taken not to give them much heat, especially at night, and they should be exposed as much as possible to air after they have once rooted in their pots: unless this is attended to, they become weak and what is called drawn up—or what might be called starved—for this well-known appearance arises from the plants not having been able to consume the necessary quantity of carbonic acid gas, which is, as is well known, the matter on which they feed. Plants can only feed in free air and bright sunlight: if therefore they are prevented from doing this they are starved; for it must not be supposed that a copious supply of stimulating manure will supply the place of light and air; on the contrary, it will but augment the mischief that results from their deficiency.

ANNUITY (in Law) consists in the payment of a certain sum of money, yearly calculated, and charged upon the person or personal estate of the individual from whom it is due; for if it is charged upon his real estate, it is not an annuity but a rent. [See RENT.] A sum of money payable occasionally does not constitute an annuity; the time of payment must recur regularly at certain stated periods, but it is not necessary that these periods should be at the interval of a year; an annuity may be made payable quarterly, or half-yearly, (as is very generally the case,) or at any other aliquot portion of a year; and it may even be made payable once in two, three, twenty, or any other number of years.

Under the Roman law, annuities were chiefly such as were created by will, constituting a charge upon the heir in

favour of the legatee. (See *Digest*, lib. xxxiii. tit. 1. *Domat's Civil Law*, 2d Part, book iv., tit. 2, sec. 1.) In the middle ages they were frequently given to professional men as a species of retainer; and in more modern times they have been very much resorted to as a means of borrowing money. When the person who borrows undertakes, instead of interest, to pay an annuity, he is styled the *grantor*; the person who lends, being by the agreement entitled to receive the payments, is called the *grantee* of the annuity. This practice seems to have been introduced on the Continent with the revival of commerce, at a time when the advantages of borrowing were already felt, but the taking of interest was still strictly forbidden. In the fifteenth century contracts of this kind were decided by the popes to be lawful, and were recognized as such in France, even though every species of interest upon money borrowed was deemed usurious. (*Domat's Civil Law*, 1st Part, book i., tit. 6.) The commercial states of Italy early availed themselves of this mode of raising money, and their example has since been followed in the national debts of other countries. [See NATIONAL DEBT. FUNDS. STOCKS.]

An annuity may be created either for a term of years, for the life or lives of any persons named, or in perpetuity; and in the latter case, though, as in all others, the annuity as to its security is personal only, yet it may be so granted as to descend in the same manner as real property; and hence an annuity is reckoned among the species of incorporeal hereditaments.

A perpetual annuity, granted in consideration of a sum of money advanced, differs from interest in this, that the grantee has no right to demand back his principal, but must be content to receive the annuity which he has purchased, as long as it shall please the other party to continue it:—but the annuity is in its nature redeemable at the option of the grantor,—who is thus at liberty to discharge himself from any further payments by returning the money which he has borrowed. It may, however, be agreed between the parties (as it generally has been in the creation of our own national debt, which consists chiefly of annuities of this sort) that the redemption shall not take place for a certain number of years. The number of years within which, according to the present law of France, an annuity of this sort (*une rente constituée en perpétuel*) may be made irredeemable, is limited to ten. (See *Code Civil*, Art. 1909, &c.)

An annuity for life, or years, is not redeemable in the same manner; but it may be agreed by the parties to the contract that it shall be redeemable on certain terms:—or, it may afterwards be redeemed by consent of both parties; and where the justice of the case requires it, (where there has been fraud, for instance, or the bargain is unreasonable,) a court of equity will decree a redemption. When such an annuity is granted in consideration of money advanced, the annual payments may be considered as composed of two portions, one being in the nature of interest, the other a return of a portion of the principal, so calculated, that, when the annuity shall have determined, the whole of the principal will be repaid. Annuities for life or years, being the only security that can be given by persons who have themselves but a limited interest in their property, are frequently made in consideration of a loan. Besides this advantage, annuities for life, inasmuch as they are attended with risk, are not within the reach of the usury laws, and are therefore often used in order to evade them: the legislature has for this reason thought fit to require that certain formalities should be observed in creating them. It is enacted (by stat. 53 Geo. III., c. 141) 'That every instrument by which an annuity for life is granted shall be null and void, unless, within thirty days after the execution thereof, there shall be enrolled, in the High Court of Chancery, a memorial containing the date, the names of the parties and witnesses, and the conditions of the contract; and if the lender does not really and truly advance the whole of the consideration money,—that is, if part of it is returned, or is paid in notes which are afterwards fraudulently cancelled, or is retained on pretence of answering future payments, or if, being expressed to be paid in money, it is in fact paid in goods,—the person charged with the annuity (that is, the borrower) may, if any action should be brought against him for the payment of it, by applying to the court, have the instrument cancelled.' The same statute also enacts, that every contract for the purchase of an annuity, made with a minor, shall be void, and shall remain so, even though the minor, on coming of age, should attempt to confirm it. The pro-

visions of this act are intended to be confined to cases where the annuity is granted in consideration of a loan.

Annuities may be, and very frequently are, created by will, and such a bequest is considered in law as a general legacy, and, in case of a deficiency in the estate of the testator, it will abate proportionally with the other legacies. The payment of an annuity may be charged either upon some particular fund (in which case if the fund fails the annuity ceases) or upon the whole personal estate of the grantor; which is usually effected by a deed of covenant, a bond, or a warrant of attorney. If the person charged with the payment of an annuity becomes bankrupt, the annuity may be proved as a debt before the Commissioners, and its value ascertained, according to the provisions of the bankrupt act (6 Geo. IV., c. 16, s. 54). The value thus ascertained becomes a debt charged upon the estate of the bankrupt; and hereby both the bankrupt and his surety are discharged from all subsequent payments.

If the person on whose life an annuity is granted dies between two days of payment, the grantee has no claim whatever in respect of the time elapsed since the last day of payment [see APPORTIONMENT]: from this rule, however, are excepted such annuities as are granted for the maintenance of the grantee, and the parties may in all cases, if they choose it, by an express agreement, provide that the grantee shall have a rateable portion of the annuity for the time between the last payment and the death of the person on whose life it is granted. On government annuities a quarter's annuity is paid to the executors of an annuitant, if they come in and prove the death. (See Comyn's *Digest*, tit. Annuity; Lumley *On Annuities*.)

ANNUITY, a term derived from the Latin *annus*, a year; signifying, in its most general sense, any fixed sum of money which is payable either yearly, or in given portions at stated periods of the year. Thus, the lease of a house, which lets for 50*l.* a year, and which has 17 years to run, is to the owner an annuity of 50*l.* for 17 years. In an ordinary use of the term, it signifies a sum of money payable to an individual yearly, during life. In the former case, it is called, in technical language, an *annuity certain*, and in the latter, a *life annuity*.

It is evident that every beneficial interest which is either to continue for ever, or to stop at the end of a given time, such as a freehold, a lease, a debt to be paid in yearly instalments, &c., is contained under the general head of an *annuity certain*, while every such interest which terminates with the lives of any one or more individuals, all that in law is called a *life-estate*, and all salaries, as well as what are most commonly known by the name of life annuities, fall under the latter term. Closely connected with this part of the subject are copyholds, (which see,) in which an estate is held during certain lives, but in which there is a power of renewing any life when it drops, that is, substituting another life in place of the former, on payment of a fine—*REVERSIONS*, or the interest which the next proprietor has in any estate, &c., after the death of the present—and *life-insurance*, (see *INSURANCE*), in which the question is, what annuity must A. pay to B. during his life, in order that B. may pay a given sum to A.'s executors at his death.

If money could not be improved at interest, the value of an annuity certain would simply be the yearly sum multiplied by the number of years it is to continue to be paid. Thus a lease for 3 years of a house which is worth 100*l.* a year, might either be bought by paying the rent yearly, or by paying 300*l.* at once. A life annuity, in such a case, will be worth an annuity certain, continued for the average number of years lived by individuals of the same age as the one to whom the annuity is granted. But if compound interest be supposed, which is always the case in real transactions of this kind, the landlord, in the case of the annuity certain just alluded to, must only receive such a sum, as when put out to interest, with 100*l.* subtracted every year for rent, will just be exhausted at the end of 3 years. To exemplify this, let us suppose that money can be improved at 4 per cent. In Table I., in the column headed 4 p. c. (4 per cent.) we find 2.775 opposite to 3 in the first column, by which is meant that the present value of an annuity of one pound to last 3 years is 2.775*l.*, or 2*l.* 7*sh.* 5*d.* The present value of an annuity of 100*l.* under the same circumstances is, therefore, 277*l.*, or 277*l.* 10*s.* This is the value of a lease for three years corresponding to a yearly rent of 100*l.* The landlord who receives this, and puts it out at 4 per cent., will, at the end of one year, have 288*l.* 12*s.* From

this he subtracts 100*l.* for the rent which has become due and puts out the remainder 188*l.* 12*s.* again at 4 per cent. At the end of a year this has increased to 196*l.* 2*s.* 10*d.*, from which 100*l.* is again subtracted for rent. The remainder, 96*l.* 2*s.* 10*d.*, again put out at interest, becomes at the end of the year 99*l.* 19*s.* 9*d.*, within three pence of the last year's rent. This little difference arises from the imperfection of the Table, which extends to three decimal places only.

TABLE I.—Present Value of an Annuity of One Pound

No. of Years.	3 p. c.	3½ p. c.	4 p. c.	5 p. c.
1	.971	.966	.962	.952
2	1.913	1.900	1.886	1.859
3	2.829	2.802	2.775	2.723
4	3.717	3.673	3.630	3.546
5	4.580	4.515	4.452	4.329
6	5.417	5.329	5.242	5.076
7	6.230	6.115	6.002	5.786
8	7.020	6.874	6.733	6.463
9	7.786	7.608	7.435	7.108
10	8.530	8.317	8.111	7.722
15	11.938	11.517	11.118	10.380
20	14.877	14.212	13.590	12.462
25	17.413	16.482	15.622	14.094
30	19.600	18.392	17.292	15.372
40	23.115	21.355	19.793	17.159
50	25.730	23.456	21.482	18.256
60	27.676	24.945	22.623	18.929
70	29.123	26.000	23.395	19.343
For ever	33.233	28.571	25.000	20.000

To find the present value of an annuity of 1*l.* per annum continued for 10 years, interest being at 5 per cent., look in the column headed 5 p. c., and there, opposite to 10 in the first column, will be found the value 7.722*l.*, or 7*l.* 14*s.* 6*d.* This would be commonly said to be 7.722 *year's purchase* of the annuity. For a convenient rule for reducing decimals of a pound to shillings and pence, and the converse, see the *Penny Magazine*, No. 52. It may also be done by the following table:

TABLES II. and III.—For reducing Decimals of a Pound to Shillings and Pence, and the converse.

Dec.	s.	Dec.	s.	d.	Dec.	d.
.1	2	.01	0	2½	.001	0¼
.2	4	.02	0	5	.002	0½
.3	6	.03	0	7½	.003	0¾
.4	8	.04	0	9¾	.004	1
.5	10	.05	1	0	.005	1¼
.6	12	.06	1	2½	.006	1½
.7	14	.07	1	5	.007	1¾
.8	16	.08	1	7½	.008	2
.9	18	.09	1	9¾	.009	2¼
s.	Dec.	d.	Dec.	f.	Dec.	
1	.05	1	.004	½	.001	
2	.1	2	.008	1	.002	
3	.15	3	.013	1½	.003	
4	.2	4	.017	2		
5	.25	5	.021			
6	.3	6	.025			
7	.35	7	.029			
8	.4	8	.033			
9	.45	9	.037			
10	.5	10	.042			
		11	.046			

For example, what is .665*l.* in shillings and pence?

TABLE II.	s.	is	£0	12	0
.06	6	"		1	2½
.005		"			1½
.665			£0	13	3¾

Again, what is 17*s.* 10¾*d.* in decimals of a pound?

TABLE III.	£0	10	0	is	5
		7	0	"	.35
			10	"	.042
				¾	.003
	£0	17	10¾		.895

These conversions are not made with perfect exactness, as only three decimal places are taken. The error will never be more than one farthing.

To use Table I. where the number of years is not in the table, but is intermediate between two of those in the table, such a mean must be taken between the annuities belonging to the nearest years above and below the given year, as the given year is between those two years. This will give the result with sufficient nearness. We must observe, that no tables which we have room to give are sufficient for more than a first guess, so to speak, at the value required, such as may enable any one, who is master of common arithmetic, not to form a decisive opinion on the case before him, but to judge whether it is worth his while to make a more exact enquiry, either by taking professional advice, or consulting larger tables. As an example of the case mentioned, suppose we ask for the value of an annuity of 1*l.* continued for 12 years, interest being at 4 per cent. We find in Table I., column 4 per cent.

For 10 years	8.111
" 15 "	11.118
Difference	3.007

Since 5 years adds 3.007 to the value of the annuity, every year will add about one-fifth part of this, or .601, and 2 years will add about 1.202. This, added to 8.111, gives 9.313. The real value is more near to 9.385, and the error of our table is .07 out of 9.313, or about the 133rd part of the whole. The higher we go in the table, the less proportion of the whole will this error be.

The last line in Table I. gives the value of the annuity of 1*l.* continued for ever: for example, at 5 per cent., the value of 1*l.* for ever, or, as it is called, a *perpetuity* of 1*l.*, is 20*l.* This is the sum which at 5 per cent. yields 1*l.* a year in interest only, without diminution of the principal. We see that an annuity for a long term of years differs very little in present value from the same continued for ever: for example, 1*l.* continued for 70 years at 4 per cent. is worth 23.395*l.*, while the perpetuity at the same rate is worth only 25*l.* Hence the present value of an annuity which is not to begin to be paid till 70 years have elapsed, but is afterwards to be continued for ever, is 1.605 at 4 per cent.: which sum improved during the 70 years, would yield the 25*l.* necessary to pay the annuity for all years succeeding.

TABLE IV.—Amount of an Annuity of One Pound.

60	163.053	196.517	237.991	353.581
70	230.594	288.938	364.290	588.529

In this Table we see what would be possessed by the receiver of an annuity at the end of his term, if he put each year's annuity out at interest so soon as he received it. For example, an annuity of 1*l.*, in 40 years, at 5 per cent., amounts to 120.8*l.*, which includes 40*l.* received altogether at the end of the different years, and 80.8*l.* the compound interest arising from the first year's annuity, which has been 39 years at interest, the second year's annuity which has been 38 years at interest, and so on, down to the last year's annuity, which has only just been received. When the annuity is payable half-yearly, or quarterly, its present value is somewhat greater than that given in the preceding Table. For the annuitant, receiving certain portions of his annuity sooner than in the case of yearly payments, gains an additional portion of interest. Since 4 per cent. is 2 per cent. half yearly and 1 per cent. quarterly, and since every term contains twice as many half-years as years, and four times as many quarters, it is evident that an annuity of 100*l.* a-year, payable half-yearly, at 4 per cent., for 10 years, is the same in present value as one of 50*l.* per annum, payable yearly, at 2 per cent., for 20 years. Again, 100*l.* a-year, payable quarterly for 10 years, money being at 4 per cent., is equivalent to an annuity of 25*l.*, payable yearly for 40 years, money being at 1 per cent.

The principles on which the calculation of life annuities

depends will be more fully explained in the articles PROBABILITY and MORTALITY. Let us suppose 100 persons, all of the same age, buy a life annuity at the same office. Let us also suppose it has been found out, that of 100 persons at that age 10 die in the first year, on the average, 10 more in the second year, and so on. If then it can be relied upon that 100 persons will die nearly in the same manner as the average of mankind, or at least that in such a number, the longevity of some will be compensated by the unexpected death of others, the fair estimation of the value of a life annuity to be granted to each may be made as follows. To make the question more distinct, let us suppose the bargain to be made on the 1st of January, 1833, so that payment of the annuities is due to the survivors on new-year's day of each year. Moreover let each year's annuity be made the subject of a separate contract. The first question is, what ought each individual to pay in order that he may receive the annuity of 1*l.*, if he survives, in 1834? By the general law of mortality, we suppose that only 90 will remain to claim, who will, therefore, receive 90*l.* among them, the remaining 10 having died in the interval. It is sufficient, therefore, to meet the claims of 1834, that the whole 100 pay among them, January 1, 1833, such a sum as will, when put out at interest, (suppose 4 per cent.,) amount to 90*l.* on January 1, 1834. This sum is 86.651*l.*, and its hundredth part is .86651*l.*, which is, therefore, what each should pay to entitle himself to receive the annuity in 1834. There will be only 80 to claim in 1835, and, therefore, the whole 100 must among them pay as much as will, put out at 4 per cent. for 2 years, amount to 80*l.* This sum is 73.968*l.*, and its hundredth part is .73968*l.*, which is, therefore, what each must pay, in order to receive the annuity, if he lives, in 1835. The remaining years are treated in the same way, and the sum of the shares of each individual for the different years, is the present value of an annuity for his life. We must observe, that in the term *value of an annuity*, it is always implied that the first annuity becomes payable at the expiration of a year after the payment of the purchase money.

The value of a life annuity depends, therefore, upon the manner in which it is presumed a large number of persons, similarly situated with the buyer, would die off successively. Various Tables of these *decrements of life*, as they are called, have been constructed, from observations made among different classes of lives. Some make the mortality greater than others: and of course, Tables which give a large mortality, give the value of the annuity smaller than those which suppose men to live longer. Those who buy annuities would, therefore, be glad to be rated according to tables of high mortality or low expectation of life; while those who sell them would prefer receiving the price indicated by tables which give a lower rate of mortality. In insurances the reverse is the case: the shorter the time which a man is supposed to live, the more must he pay the office, that the latter may at his death have accumulated wherewithal to pay his executors. We now give in Table V., the values of annuities according to three of the most celebrated Tables.

TABLE V.—Present Value or Purchase-money of a Life Annuity.

95	.2	.2	.2	2.8	2.7	2.6	.6	1.0

The first of these is calculated from the Northampton Table, formed by Dr. Price, from observations of burials, &c.,

at Northampton. As compared with all other Tables of authority, it gives too high a mortality at all the younger and middle ages of life, and, consequently, too low a value of the annuity. The second is from the Carlisle Table, formed by Mr. Milne, from observations made at Carlisle. *It gives much less mortality than most other Tables, and, therefore, gives higher values of the annuities: but it has since been proved to represent the actual state of life among the middle classes, in the century now ending, with much greater accuracy than could have been supposed, considering the local character of the observations from which it was derived.* The third table is that constructed by Mr. Finlaison, from the observation of the mortality in the government tontines and among the holders of annuities granted by government in redemption of the national debt, and differs from the former two in distinguishing the lives of males from those of females. Most observations hitherto published unite in confirming the fact, that females, on the average, live longer than males, and in the annuities now granted by government, a distinction is made accordingly. The mean between the values of annuities on male and female lives, according to the Government Tables, agrees pretty nearly with the Carlisle Tables, the rate of interest being the same.

For the materials of Table V., we are indebted to the works of Dr. Price, on *Reversionary Payments*; of Mr. Milne, on *Annuities and Insurances*; and to Mr. Finlaison's *Report to the House of Commons on Life Annuities*; to all of which we refer the reader. The tables are of course very much abridged.

To use the Table V., suppose the value of an annuity of 100*l.* a-year, on a life aged 35, is required, interest being at 4 per cent., which is nearly the actual value of money. We find in the column marked 4 per cent., opposite to 35, under the Northampton Tables 14.0, under the Carlisle 16.0, and under the Government Tables 15.7 or 16.9, according as the life is male or female. These are the number of pounds which ought to buy an annuity of 1*l.*, according to these several authorities: and taking each of them 100 times, we have:—

Northampton Table . . .	1100Z.
Carlisle Table . . .	1600Z.
Government Table (males) .	1570Z.
Government Table (females)	1690Z.

We cannot suppose that the annuity could be bought for less than would be required by the Carlisle Tables.

To find the value of an annuity on a life whose age lies between two of those given in the table, the process must be followed which has been already explained in treating of annuities certain.

An annuity on two joint lives is one which is payable only so long as both the persons on whose lives it is bought are alive to receive it.

cent., w	1.3								

The preceding table gives the results of the Carlisle and Northampton Tables on the value of this species of annuity, interest being at 4 per cent. The first column shows the age of the *younger* life, and the horizontal headings are *not* the age of the elder life, but the excess of the age of the elder life above that of the younger. For example, to know the value of an annuity in two joint lives, aged 25 and 55, in which the difference of age is 30 years. In the Carlisle Table *opposite* to 25, the *younger*, and under 30, the *difference*, we find 10·3; and 8·8 in the Northampton. For the value of an annuity of 100*l.*, the first tables give, therefore, 1030*l.*, and the second 880*l.*

The value of an annuity on the longest of two lives, that is, which is to be payable as long as either of the two shall be alive to receive it, is found by adding together the values of the annuity on the two lives separately considered, and subtracting the value of the annuity on the joint lives. For the above species of annuity puts the office and the parties in precisely the same situation as if an annuity were granted to each party separately, but on condition that one of the annuities should be returned to the office so long as both were alive, that is, during their joint lives. For example, let the ages be 25 and 55 as before, and let the Carlisle Table be chosen, interest being at 4 per cent., we have then:

TABLE V.	Annuity at age 55	. .	11·3
 25	. .	17·6

	Sum	28·9
TABLE VI.—Joint annuity, 55 & 25		10·3

Difference . . 18.6

The value, therefore, of an annuity of 1% per annum on the survivor is 18·6%.

The value of an annuity which is not to be payable till either one or other of two persons is dead, and which is to continue during the life of the survivor, is found as in the last case, only subtracting *twice* the value of the joint annuity, instead of that value itself. In the preceding case it is 8 $\frac{3}{4}$. For this case only differs from the preceding, in that the annuity is not payable while both are alive, that is during the *joint* lives. Consequently the value in this case is less than that in the last, by the value of an annuity on the joint lives.

The value of an annuity to be paid to A. from and after the death of B., if the latter should happen to die first, is the value of an annuity on the life of A. diminished by the value of an annuity on the joint lives of A. and B. For the situation is exactly the same as if the office granted an annuity to A., to be returned as long as both should live. The ages and Table being as before, and the life on whose survivorship the annuity depends being that aged 25, we have:—

TABLE V.—Annuity at age 25 . . . 17·6

TABLE VI.—Joint annuity, 25 & 55 . . . 10·3

Difference . . . 7.3

whence the value of the required annuity of 1*l.* is 7'3*c.*

The following Table, extracted with abridgment from Morgan on *Insurances*, deduced from the Northampton Table, with interest at 4 per cent., gives the average sum to which the savings of an individual may be expected to amount at the end of his life, improved at compound interest from the time when he begins to lay by:—

TABLE VII.—*Probable amount of M. laid by yearly, and improved to the end of Life.*

Age.	Amount.	Age.	Amount.	Age.	Amount.	Age.	Amount.
0	137·8	25	79·2	50	29·5	75	7·2
5	159·1	30	66·0	55	23·6	80	4·8
10	137·9	35	54·6	60	18·5	85	3·2
15	111·1	40	44·9	65	14·1	90	2·0
20	91·5	45	36·6	70	10·3		

That is to say, according to the Northampton Tables, if a person were, at the age of 26, (that is, a year after 25.) to begin laying by 100*l*. a year at interest, he might expect the amount at the end of his life to be 79*½*l. for each pound laid by yearly; or 7920*l*. Or to speak more strictly, if 100 persons were to do this, they might expect that the average amount of their savings, reckoning the accumulations at their deaths, would be 7920*l*. each. As we have already observed, the mortality of the Northampton Table is greater

than the fact, and the average accumulations would be greater, from young ages considerably greater, than those shown in the preceding table.

We have seen that the security of the method for estimating the value of life annuities, depends upon the presumption that the average mortality of the buyers is known. This average cannot be expected to hold good, unless a large number of lives be taken. Therefore, the granting of a single annuity, or of a few annuities, as a commercial speculation, would deserve no other name than gambling, even though the price demanded should be as high as that given in any tables whatsoever.

In the preceding tables, we would again remark, that our object has been simply to furnish the means of giving a moderately near determination of a few of the most simple cases. We should strongly recommend every one not to venture on important transactions, without professional or other advice on which he can depend, unless he himself fully understands the principles on which tables are constructed. The liability to error, even in using the most simple table, is very great, without considerable knowledge of the subject; and most cases which arise in practice contain some circumstances peculiar to themselves, which have not and could not have been provided for in the general rules.

The following references to works on this subject may be found useful.

ANNUITIES CERTAIN. 1. *Smart's Tables of Interest, &c.* London, 1726. There is an edition published in 1760, which is said to be very incorrect. The values for the intermediate half years given in this work are not correctly the values of the annuities on the supposition of half yearly payments; in other respects it is to be depended upon. 2. *Corbaux, Doctrine of Compound Interest, &c.* London, 1823. 3. *Baily, Doctrine of Interest and Annuities.* London, 1808. *Smart's Tables* are republished in this work from the correct edition. Works on *life-annuities* generally contain principles and tables for the calculation of annuities certain.

(Seventh Edition.) 2. *Baily, on Life Annuities and Assurances.* London, 1810. 3. *Milne, on the Valuation of Annuities and Assurances, &c.* London, 1815. 4. *Morgan, on the Principles of Assurance, Annuities, &c.* London, 1821. 5. *Davies' Tables of Life Contingencies.* London, 1825. 6. *Finlaison, on the Evidence and Elementary Facts on which Tables of Life Annuities are Founded.* Printed by the House of Commons, 31st March, 1829. 7. *Gompertz, Estimation of the value of Life Contingencies, in Philosophical Transactions,* 1820.

ANNULET, in architecture. This term is applied to the small eccentric rings or bands which enrich the lower part of the moulding of the Doric capital, just where it falls into, or grows out of, the top of the shaft, or trachelium. It is formed from the Latin word signifying a ring.

ANNULUS, the geometrical name of a ring, or solid formed by the revolution of a circle about a straight line exterior to its circumference as an axis, and in the plane of the said circle.

To find the surface of a ring, measure the interior and exterior diameters in feet or inches, &c. Multiply together the sum and difference of these diameters, and multiply the product by 2.1674011, taking as many decimals as may be thought necessary. For common purposes it will be sufficiently exact to divide 200 times the product of the sum and difference twice successively by 9. If still greater correctness be required, subtract from the last result its 500th part. The result will be the number of square feet, or inches, &c., in the surface of the ring.

To find the solid content of a ring, measure the outer and inner diameters as before, multiply together their sum and the square of their difference, and multiply this product by .3084251. For common purposes, it will be sufficient to annex three ciphers to the product of the sum and the square of the difference, and to divide by 3242. The result will be the number of cubic feet or inches, &c. in the ring.

ANOA, a species of ruminating animal, so very imperfectly known, that zoologists are undetermined whether to consider it as an antelope or a species of buffalo. This uncertainty arises from the fact, that though the animal has been noticed for many years, only a few fragments of skulls and horns have been hitherto brought to Europe, and even these too imperfect to acquaint us with the zoological characters of the animal. Judging, however, from these

materials, the anoa would really appear to be a species in many respects intermediate between the buffaloes and antelopes, as at present defined; agreeing with the former in the form of its horns, and with the latter in their position.

Mr. Pennant is the first naturalist who has mentioned this animal, but he has given no account of its characters, and merely relates, that it is about the size of a middling sheep, is wild and fierce, and resides in large herds among the rocky mountains of the island of Celebes. He considers it as a small species of wild buffalo, and adds, that it is captured only with great difficulty, and is so fierce in confinement, that some of these animals, belonging to Governor Loten, in one night ripped up the bellies of fourteen stags which were kept in the same paddock with them. The next author who mentions the anoa from original documents or personal observation, is Colonel Hamilton Smith, who in the fourth volume of Griffith's translation of the *Régne Animal*, describes the head and horns, and considers the animal as a species of antelope. Colonel Smith's fragment was brought from Celebes by the late Dr. Clarke Abel, who obtained it on his return from China in the suite of Lord Amherst; but since that period various other heads have been brought to Europe, some of which are deposited in the British Museum, and in the collection of the London Zoological Society. The

[Horns of Anoa.]

horns are erect, perfectly straight and in the plane of the forehead; they are about the same length as the head, that is, about nine or ten inches, strongly depressed or flattened in front, of nearly the same breadth till within three inches of the extremities, whence they are rather attenuated to the tips which are bluntly pointed, and irregularly wrinkled, or rather crumpled throughout the greater part of their length. The head is long and narrow, terminating in a broad muzzle, and all the characters so different from those of antelopes, that we prefer, in the present state of our knowledge, describing the animal under its native name of anoa, to the risk of originating future error by associating it with a genus to which it appears to bear but a very remote analogy.

ANODYNES, from the Greek word *ἀνώδυνος* (*anódynos*), which sometimes signifies, 'that which relieves from pain.' We may consider pain as an intimation of some derangement of the system, the continuance of which would be hurtful. It therefore prompts us to take measures to remove the causes of it, which being done, the pain generally ceases. But as pain itself, from the inconvenience and suffering which it occasions, frequently aggravates the disease of which it is the accompaniment, it becomes necessary to employ means to lessen or suspend it, even though we should not be able to control the disease: these means are termed *anodynes*, and are either applied externally, or given internally.

The seat of pain is evidently in the nervous system, but its cause and origin appear to be intimately connected with the state of the circulating system, particularly with the quantity of blood contained in the arteries, and the degree of force and rapidity with which it passes through them. Hence pain may be said to be of two kinds: that which occurs when the blood stagnates in the extreme vessels, or capillaries, while the larger vessels propel it with increased force, or the state termed *inflammation*; and that which occurs when there is a deficiency of blood

In the extreme vessels, from the action of the large vessels being too feeble to propel it, as happens after long abstinence from food, or other causes of exhaustion—such as prolonged suckling of infants by mothers. The discrimination of these two kinds of pain is of great practical importance; for while the first will be relieved by bleeding and anodynes, the second will be greatly aggravated by the employment of either of these means. It is therefore to the former that the use of anodynes must be limited, in which they appear to be productive of benefit in two ways: first, by rendering the nerves of the part less sensible; and, secondly, by diminishing the violence with which the large vessels propel the blood, when the anodynes are given in sufficient quantity to influence the brain, and through it, by a process extremely complex, which we need not explain here, the contractile power of the heart and arteries. As most of the articles termed anodynes have a powerful influence over the brain, they generally produce sleep, if given in a large dose: hence they are also denominated *hypnotics*; and from causing insensibility, they are also denominated *narcotics*. The knowledge of their possessing this power should lead us to observe great caution in their administration, lest by an over-dose we should produce a fatal coma, or very profound sleep, from which the patient might never be roused.

It deserves also to be mentioned, that their frequent repetition produces an injurious effect on the frame, particularly on the nervous system, and function of nutrition; we should therefore carefully guard against acquiring a habit of having recourse to them on slight occasions, or without the sanction of a competent authority. The opium-eater not less certainly induces disease, and brings himself to an untimely end, than he who indulges in ardent spirits.

The substances used as anodynes are, with one exception, derived from the vegetable kingdom, and will be further treated of under the names of the plants which produce them. They are Opium, Hyoscyamus, or Henbane, Solanum Dulcamara, or Woody Night-shade, Atropa Belladonna, or Deadly Night-shade, Hydrocyanic, or Prussic acid, and Carbonic-acid-gas applied in the yest poultice, and other forms.

ANOLIS, in zoology, a genus of saurian reptiles, belonging to that section of the iguanian family which Baron Cuvier distinguishes by having teeth in the palate of the mouth as well as in the maxillary bones. They are readily distinguished from the iguanas, properly so called, the basilisks, and other genera of this division, by the peculiar form of the antepenultimate phalange of the toes, which is flattened beneath, and furnished with a kind of pad or cushion, grooved or striated transversely, and serving to make the animals adhere more firmly to those substances which they grasp in walking. In this particular point of their structure the anolis approach the geckoes, but it does not enable them to exercise the singular power of walking with the legs uppermost, like flies on a ceiling, which some of these reptiles possess. The toes, however, are much longer and better separated than those of the geckoes, and the claws, instead of being short and flattened, are long, crooked, and sharp-pointed. The body and tail are long and slender, as are also the legs, particularly those behind, which are rather longer than the fore legs; each foot has five toes. The whole body and tail, both above and below, are covered irregularly with small round scales, which give the skin a granulated appearance like that of fine shagreen. The head is long and straight; the forehead and face flattened and covered with numerous little pentagonal and hexagonal scales; the tongue is fleshy, short, round, undivided at the point, and not protractile, being almost throughout its whole length attached to the under jaw. The tail is in all cases as long or longer than the body, more or less compressed on the sides, with a few slight plies or indistinct foldings, each comprising two or three circular rows of scales, and in some species provided with a crest supported by the erect spinous processes of the caudal vertebrae. The teeth, as well maxillary as palatal, are small, sharp, and serrated; and the skin of the throat forms, at least in the greater number of species, a loose hanging bag, which is capable of being dilated or distended with air at the will of the animal. Finally, the ribs of the opposite sides are united in front, and form complete circular hoops round the body.

The anolis are entirely an American genus, and seem, in many respects, to supply, in the New World, the place which the chameleons occupy in the Old. The colours of their

skins change with the same or even greater rapidity, especially on the loose skin of the throat, which is constantly distended when these animals are actuated by strong passions, either of fear, anger, or love, and in this state assume an endless succession of ever-varying hues. They differ from the chameleons, however, in their more slender and graceful proportions, and in the great activity of their movements, displaying all the restlessness and celerity of the common green lizard of Europe. They frequent woody and stony situations indifferently, climb and leap with such swiftness and facility that their pace has been compared to the flight of a bird; and when overheated or fatigued by their exertions, will stop, open their mouths, and pant like a tired dog. They are extremely timid and harmless; feed for the most part upon flies and other small insects, though M. Cuvier found the stomach of one species filled with berries; and though often inhabiting the neighbourhood of marshes and other moist situations, do not appear to be aquatic. There are two small subgenera, distinguished from one another by the presence or absence of the carinated crest on the upper surface of the tail. The first of these divisions, comprehending those which have this crest, consists of a number of species definitely characterised by M. Cuvier, but formerly confounded under the denominations of *Lacerta principalis* and *Lacerta bimaculata*. The principal are,

1. The *Anolis velifer*, of Baron Cuvier, of a beautiful dark

[*Anolis velifer*.]

ashy blue colour, and perhaps the largest of the whole genus, the body measuring a foot in length, and the tail being about half as long again. The crest extends along the top of the tail for half its length from the origin, and is supported by from twelve to fifteen rays; the loose skin beneath the throat extends from the chin even to the belly, and when not distended forms a longitudinal fold along the whole under surface of the animal: and the food, from the observation of Baron Cuvier, would appear, at least occasionally, to consist of berries and other vegetable substances. It inhabits Jamaica and the Antilles generally, preferring the woods to the open country, and lodging in decayed trees or small crevices in the ground, where the female likewise deposits her eggs. It is incessantly in motion, and when pleased frequently emits a low but acute chirp; though harmless and extremely timid, it possesses a considerable share of curiosity, and allows itself to be readily caught in little rush snares, which children in the West Indies amuse themselves by placing in its haunts, alluring it from its concealment by imitating its voice.

2. The *Anolis bimaculata*, of Sparrman, little more than half the size of the former species, but with the same general form and habits, and with a similar crest upon the first half of the tail. The general colour is a greenish blue, clear on the top of the head and neck, but mixed with dark brown on the body, tail, and extremities, and marked with numerous small black spots on the head and sides, and two large ones on the shoulders, from which it derives its specific name. It is found in North America, from Pennsylvania to the shores of the Gulf of Mexico, and in the Antilles.

The second subdivision of the genus anolis consists of species without a carinated crest on the tail, but in no other respect differing from those already described. Of these the principal are,

3. The *Anolis equestris* of Merrem, of which the tail, more flattened on the sides than in the following species, still retains a slight indication of the crest which distinguishes those of the former division. The body of this species mea-

sures about a foot in length, and the tail is nearly half as long again. It is of a light tawny colour, agreeably clouded in different parts with blotches of an ashy lilac tinge, but so blended and shaded off with the ground colour of the body, as never to assume the form of distinct spots. The skin of the throat is white, and a band of the same colour passes

[*Anolis Equestris*.]

over each shoulder, and runs parallel to the back almost half way down each side. Though the crest on the tail does not appear externally, yet the spinous processes of the caudal vertebræ have the same elevated form as in the anolis of the first subgenus, and appear to be concealed only by the more fleshy form of the tail. The habitat of this species has not been exactly determined.

4. The *Anolis cepedii* of Merrem is a pretty little species, found likewise in the Antilles, about half the size of the last, of a green colour, with a short muzzle spotted with brown, and, except in the absence of the crest on the tail, very similar to the *Anolis bimaculata*. Its habits are well described by Lacepède.

5. *Anolis lineatus* of Daudin resembles the last species in its pure bright green colour, but it is rather larger, and is marked along each flank with two parallel lines of oblong black spots, the upper of which passes over the arms and thighs, and the under between the shoulders and hips. It inhabits different parts of South America.

6. The *Anolis bullaris* of Merrem, first described by Catesby in his *Natural History of Carolina*, under the name of green lizard, is a very beautiful species, of a greenish gold colour, particularly distinguished by a black band on the temples, and the elongated and flattened form of its muzzle. This and the two last-described species, as well as various others described by Daudin, prince Maximilian, and others, have the loose skin of the throat of a beautiful cherry colour when distended, and change from one hue to another with a facility and rapidity truly astonishing.

ANOMALISTIC YEAR, the interval which elapses between two successive times when the earth is at the least distance from the sun. If the earth's orbit were a perfect ellipse, this would be exactly equal to the common or tropical year; the orbit is, however, more nearly represented by an ellipse of which the axis revolves through $11''\cdot 8$ in a year. That is, if we imagine a star which is always eclipsed by the sun's centre, at the moment when the earth is at its least distance, that star must follow the sun at the rate of $11''\cdot 8$ in a year, or a revolution in 108,000 years, in round numbers. The anomalistic year, or the time between two successive eclipses of the supposed star, is 25 minutes longer than the tropical year, being 365 days, 6 hours, 13 minutes, 45 seconds.

ANO'MALY, (in Astronomy,) a term derived from the Greek ἀνωμαλος (*anomalos*), unequal or irregular, and applied in astronomy to the angle through which the radius drawn from a planet to the sun, has moved with the planet from the time when the planet was at its least distance from the sun. The term was applied to this angle, as being the angle whose irregularities were first observed; though it must be confessed that this is not a happy specimen of mathematical nomenclature.

Let S be the position of the sun, in the focus of the ellipse described by the planet, A the *perihelion*, or point of least distance from the sun, A P M the ellipse described by the planet, A Q M the circumscribed circle, P the place of the planet, and Q P N a perpendicular to the axis A M. Let C be the centre of the ellipse and circle. The planet

moves quickest at A, and slowest at M. Conceive a fictitious planet Z to move round the ellipse A P M, with the average motion of the real planet, so as, without varying its motion, to make the angle A S Z increase uniformly, and to describe the whole revolution in the same time as the real planet. Then, for the moment when the planet is at P, the angle A S P is called the *true anomaly*, A S Z is called the *mean anomaly*, and A C Q the *eccentric anomaly*. In speaking of the sun or the moon, it is the earth which is supposed to be at S, and the sun or moon at P. Also, in speaking of the satellites of Jupiter or Saturn, the planet is supposed to be at S, and the satellite at P. For a double star, one star is supposed to be at S, and the other to revolve round it.

The determination of either two anomalies from the third, is a problem of considerable difficulty, the discussion of which may be found in any mathematical work on astronomy.

ANONA'CEÆ, a natural order of plants consisting of tropical or subtropical trees and bushes, that usually abound in a powerful aromatic secretion, which renders the flowers of some highly fragrant, the leaves of others a grateful perfume, and the dried fruits of many so highly aromatic as to vie with the spices of commerce; among these last is the *Æthiopian pepper* of the shops, which is yielded by the fruit of *Uvaria aromatica*. Of others of this order, the fruit is succulent and abounds in a delicate juice, which renders it a pleasant article of food: under the name of sour sop, sweet sop, and custard-apple, many kinds are

[*Annona*.]

[*Annona squamosa*, or sweet sop.]

cultivated in the West Indies and South America. Finally, the bark of some separates readily into fibres which make excellent cordage: a large tree called, in Brazil, pindaiba, and by botanists *Xylopia sericea*, is advantageously employed for this purpose.

The natural order *anonaceæ* is known from all other dicotyledonous orders by its flowers having the calyx and sepals arranged in threes, a number of carpella occupying the centre, as in a ranunculus, and by the curious circumstance of their albumen, which here constitutes the bulk of the seed, being what is called ruminated, that is, perforated in all directions by twisting and crossing passages, like the nutmeg.

The preceding cut will give an idea of the structure of this order:—1. A calyx opened, the petals having fallen away, showing the arrangement of the stamens and carpella in the inside of the flower; 2. a stamen; 3. a seed; 4. the same cut in half to show the ruminated albumen; 5. the embryo; 6. a ripe fruit, much less than the natural size: the projections on its surface are the points of the carpella which grow together into one fleshy mass, as in the raspberry; 7. a view of the same fruit cut in half.

Of the eatable fruited kinds above referred to, the most remarkable are the sweet sop, sour sop, and cherimoyer; all species of the genus *Anona*.

The sweet sop, *Anona squamosa*, is often only a small bush, growing in all the West Indian islands, where it bears a greenish fruit covered with scales, and having the appearance of a young pine cone. Its skin is half an inch thick, and contains an abundance of thick, sweet, luscious pulp; in many parts of the Indian Archipelago, it is a favourite fruit.

The custard apple, *Anona reticulata*, is an inferior kind, resembling the foregoing, but forming a larger tree, and having a much larger dark-brown fruit, the surface of which is netted all over. The pulp is yellowish, or reddish, and of about the consistence of custard.

The sour sop, *Anona muricata*, forms in the West Indies a picturesque small tree, resembling a great bay-tree. The flowers are yellow, and have an unpleasant odour. The

green, but hoary, with short down, and very blunt. It forms a small tree about twelve or fourteen feet high, and is exceedingly valued in Peru, where it is cultivated on account of the excellence of its fruit. The flowers are very fragrant; the fruit heart-shaped, greyish-brown, or black, when ripe, with a sealy rind; the fruit is white, sweet, and rich. In the garden of the archbishop of Granada, in Spain, there were specimens of this which fruited every year, and were found to be really excellent even to a European palate.

The following spirited sketch, by Mr. Westall, of the appearance of the sour sop tree, will give some idea of the effect it would be likely to produce on the scenery of the country where it grows.

ANOPLIOTHERIUM (from ἀν, privative, πλοον, and θηρ, that is, a beast without offensive arms or tusks), in fossil zoology, a genus of extinct pachydermatous quadrupeds, discovered and characterized by Baron Cuvier. The bones of these singular inhabitants of a former world, occur in great quantities, mixed with those of the palæotherium, another extinct genus of the same order, likewise described by M. Cuvier, in the gypsum or plaster quarries in the neighbourhood of Paris, and they are occasionally, though more rarely, met with in the neighbourhood of Orleans and Genou. It was only after researches continued for many years, that M. Cuvier succeeded in uniting the disjointed and broken fragments of bones belonging to the different parts and members of this genus, so as to reconstruct the complete skeleton of the animal, and obtain a definite and correct idea of its external form and appearance. The great labour and admirable skill which he has displayed in these profound and difficult inquiries were, however, finally crowned with success, and rewarded him not only with a knowledge of six distinct species, but even enabled him, in some instances, to depict their external forms, and infer, by an admirable chain of inductive reasoning, their probable habits and economy. Without entering into the minute and profound osteological comparisons which engaged the attention of M. Cuvier, and which those who desire to pursue the subject farther will find at length in the third volume of the *Ossemens Fossiles*, we shall here give the result of his inquiries, and endeavour to supply a correct idea of the form and affinities of these antediluvian inhabitants of our earth.

The first character in which the anopliotheria differ essentially from all other pachydermata, whether extinct or recent, is found in the number and arrangement of their teeth, which consist of six incisors, two canines and fourteen molars in each jaw, making in the whole forty-four teeth. These, as in the human subject, are arranged in a continued

[*Anona muricata*, or Sour Sop.]

fruit is often as heavy as 2 lb., or even 3 lb.; it is covered all over with weak prickles; its skin is yellowish-green, and very thin; its pulp is more like pith, is as white as milk, and is sweet, mixed with a most agreeable acid.

The cherimoyer, *Anona cherimolia*, is easily known from the preceding by its leaves not being shining and bright-

and uninterrupted series, without any vacancies between the molars or incisors and the canines, a circumstance peculiar to this genus of animals among the pachydermata, and which, besides man, it shares only with the shrews and hedgehogs, mammalia, in all other respects, widely different. The canines, moreover, are perfectly similar in form and appearance to the incisors, and might easily be mistaken for lateral teeth of this description, did not their situation in the jaw, beyond the maxillary suture, prove their real nature. The four posterior molars resemble those of the rhinoceros and paleotheria, that is to say, they are quadrangular in the upper jaw, and marked in the lower, with a double or triple crescent of enamel, which penetrates their substance and shows itself on the crowns in the form of salient ridges.

This formation of the organs of mastication, intimately connected as these organs necessarily are with the food and alimentary canal, demonstrate most unequivocally that these animals fed upon vegetable substances, and that, in all probability, they differed but little in this respect from the tapirs and rhinoceroses at present existing. Other details of their structure, about to be noticed, will confirm these analogies, and afford us a still clearer insight into their habits and economy.

The second important character of the anoplotheria which must have exercised a very decided influence upon their habits arises from the conformation of the extremities. These, as in ruminating animals, were terminated by two toes, enveloped in small hoofs, sometimes without accessory or false hoofs behind, as in the camels and lamas, sometimes with one or even two small lateral toes of this description, as in the pecaries, but the bones of the metacarpus and metatarsus respectively corresponding to these two toes were not united into a single canon, as they invariably are among the ruminantia, and this is in reality the principal difference between the extremities of the latter animals and those of the anoplotheria. It is to be observed, however, that this character is not peculiar to the ruminants; the pecaries, or indigenous hogs of South America, have likewise the metacarpal and metatarsal bones soldered into a single piece, exactly resembling the canon bone of the sheep or deer, and in this respect, are intermediate between the orders of the ruminantia and pachydermata. The stomachs of the pecaries likewise partake of the complication characteristic of the former group, from which, on the other hand, the camels, in all other respects true ruminants, differ widely both by the form of their feet, and the number and arrangement of their incisor teeth. These animals are, in fact, far more anomalous among the ruminants than the pecaries are among the pachydermata, and it is to their extremities, particularly, that the construction of the corresponding parts of the anoplotheria most nearly approximates. The structure of the carpus and tarsus are precisely the same in both genera; the scaphoid and cuboid bones, which are soldered together into a single piece in all the other ruminants, being separate in the camels and lamas, as they invariably are in the anoplotheria and other pachydermata. These analogies prove that the anoplotherium, which its teeth have already shown to have been essentially a pachydermatous quadruped, approached in many of its characters to the ruminantia of the existing creation, partaking, on the one hand, of the characters of the camels and lamas, and on the other of those of the rhinoceroses and pecaries. In the less prominent details of organization, however, the different species of anoplotheria present peculiarities which have induced Baron Cuvier to distribute them in three subgenera. In all, the prolongation of the nasal bones clearly shows that the anoplotheria were not furnished with trunks like the elephants, tapirs, and paleotheria; and their head altogether, judging from the form of the skull, appears to be intermediate between that of the horse and that of the camel. The first subdivision comprehends those species which M. Cuvier calls

essentially aquatic animals. The great size of their members, the depressed and heavy proportions of their bodies, and their long tails compressed horizontally at the base, must have given them much of the external form of the otter; but they resorted to the lakes and marshes of the antediluvian world, not for the purpose of preying upon other animals, but in search of aquatic plants, whilst the depressed form of their tails shows that they must have swam and plunged with greater ease and facility than either the tapir or hippopotamus. Like these animals, their ears were probably short and erect, and their bodies sparingly covered with hair, as in all the existing pachydermata. The following outline conveys a just idea of the external figure of this animal, as drawn from the skeleton by M. Cuvier.

[Anoplotherium commune.]

The subgenus *xiphodon* differs from that just described in having the inferior molars tuberculous, and being without the additional or false hoof on the fore-feet. It contains but a single species (*A. gracile*), which, judging from the length and smallness of its limbs, and the elevation of the tarsus, must have presented in every respect a complete contrast to the *A. commune*, exhibiting the light form and graceful proportions of the gazelle. Its course must necessarily have been rapid, and probably unembarrassed by a long tail: and instead of resorting habitually to the rivers and ponds, like the former species, it must have been confined to the dry land, and, probably like the gazelles and antelopes, fed upon dry aromatic herbs, and was provided with long moveable ears to warn it of the approach of danger. M. Cuvier likewise possessed a skeleton of this species, nearly perfect, and has furnished the following outline of its external form.

[Anoplotherium gracile.]

The third subgenus, *dichobunus*, contains three species, all established from the observation of detached bones, and of the actual forms of which it is consequently impossible to give a correct idea. They differed from the species contained in the two former subdivisions, principally by having a small additional or false hoof both on the fore and hind feet; and this character is so well marked in all the three subgenera of M. Cuvier, that, besides other considerations, it would suffice, among existing animals, to distinguish three separate genera, and perhaps should do so in the present instance. The *dichobunus* were all of small stature: the largest of the three known species (*A. leporinum*) was about the size of a hare; the other two (*A. micrinum* and *A. obliquum*), about that of the guinea-pig, were in all probability the smallest of hoofed quadrupeds. M. Cuvier supposes them to have been the hares and rabbits of the antediluvian world, but their whole structure seems to approximate them more correctly to the musks of the present time, and they probably differed little from these animals either in form or habits.

Anoplotheria proper: they are distinguished by having all the lower molars marked by double or triple crescents in a longitudinal direction, without salient tubercles; and by a third, or supernumerary hoof on the fore-feet. This division comprehends two species, differing from one another principally in point of size, the one (*A. commune*) being about the size of the ass, and the other (*A. secundarium*) about that of the hog. These animals were low on the limbs, probably like the tapirs, but their long and powerful tail, equalling the body itself in length, made them still more

ANQUETIL DU PERRON (Abraham Hyacinthe) was born at Paris on the 7th December, 1731. He received his early education in that capital, where he soon displayed a predilection for the study of the Hebrew language and literature. M. de Caylus, then bishop of Auxerre, induced him to study divinity, for which purpose Anquetil visited two theological seminaries. But his fondness for the literature of the East, especially the Arabian and Persian, did not allow him long to pursue his theological studies; and he returned to Paris, where he made use of the ample stores of oriental learning collected in the *Bibliothèque du Roi*. Accidentally, a fac-simile of a few pages of the *Vendidad-Sadé* came under his eyes, and this circumstance first turned his attention and inquiries towards India and the Persia. A French army was just at that time fitted out for India. Anquetil resolved to avail himself of this opportunity to visit India, and enrolled himself as a private soldier, in which capacity he quitted Paris on the 7th of November, 1754. It was only after his departure that his friends obtained for him a small pension (500 livres) from the French government, to assist him in the pursuit of his inquiries. Anquetil disembarked at Pondichery, on the Coromandel coast, the 10th of August, 1755; hence he proceeded to Chander-nagor, in Bengal, but was disappointed in his hope of finding there an opportunity of learning the Sanskrit language. At this place he was taken ill, and the capture of Chander-nagor by the English soon obliged him to leave, and return on foot, by a journey of a hundred days, to Pondichery, where he embarked on board a vessel which was bound for Surat, but landed at Malé, on the Malabar coast, and continued his way by land, and again on foot. At Surat he became acquainted with some *desturs*, or Parsi priests from Guzerat, whose assistance enabled him to make the necessary preparations for the translation of the *Zend Avesta*, which he published after his return home. The progress of the British power induced Anquetil to leave India. He embarked for Europe in an English ship, arrived at London, visited Oxford, and on the 4th of May, 1762, returned to Paris. The Abbé Barthélémy procured him an appointment in the *Bibliothèque du Roi*, and in 1763 he was elected a member of the *Académie des Belles-Lettres*. From this time Anquetil devoted himself entirely to literary labours. In 1771 he published his principal work, a translation into French of the *Zend Avesta*, or the sacred writings of the Persia, attributed by them to Zoroaster. This work had scarcely appeared, when it was attacked with undeserved severity by Mr. (afterwards Sir William) Jones, in his *Lettre à M. A*** du P***, dans laquelle est compris l'Examen de sa Traduction des livres attribués à Zoroastre*. (London, 1771, 4to.) Jones himself seems to have subsequently felt that he went too far, when he declared the work translated by Anquetil a mere fabrication of modern times. But the question concerning the genuineness or authenticity and the exact date of these writings is not yet ultimately settled. A lithographed fac-simile edition of the beautiful manuscript of the most important of them, the *Vendidad-Sadé*, which Anquetil brought home from India, is now appearing at Paris; and several French and German Orientalists, especially Eugène Burnouf of Paris and Bopp of Berlin, have, by means of Anquetil's translation, analyzed the original language, and shown its close affinity to the Sanskrit. Of Anquetil's other works we shall here only notice his *Recherches Historiques et Géographiques sur l'Inde*, which he published in 1786; and his Latin interpretation of Dara Shekuli's Persian translation of the Sanskrit *Upanishads*, or ancient and sacred treatises on the theology of the Brahmans, which appeared under the title *Oupnekhat sive secretum tegendum*, &c. (Strasburg, 1804, 2 vols. 4to.) Anquetil died on the 15th of January, 1805. (The biographical notices in the above sketch of Anquetil's life are taken chiefly from the *Biographie Universelle*.)

ANQUETIL DU PERRON (LOUIS PIERRE), the elder brother of the subject of the preceding article. He was born at Paris in 1723, and having studied theology, was, at an early age, appointed director of the Episcopal Seminary at Rheims. From this place he was removed in 1759 to the Priory of La Roë in Anjou, and thence to that of director of the College of Senlis, which situation he held for ten years. He then became Curé of Château-Renard near Montargis, where he spent twenty years of his life, performing his sacred duties in a manner which greatly endeared him to his parishioners. The new ecclesiastical

arrangements made at the revolution transferred him from this village to that of La Villette near Paris; and here he remained till 1793; when, in the general proscription of the clergy, he was seized and thrown into the prison of St. Lazare. The catastrophe of the 9th Thermidor (27th of July, 1794) delivered Anquetil along with the other victims of the overthrown tyranny. He had before this been a corresponding member of the *Academy of Belles-Lettres*; and on the establishment of the *Institute* in 1795, he was nominated one of the members of the second class. He was soon after appointed to a place under government in the foreign office, and this he held till his death on the 6th of September, 1805, at the age of eighty-four. Anquetil had all his life been fond of literary occupation; and up to its close is said to have continued his early habit of studying regularly ten hours a day. He is the author of a considerable number of historical works, of which, however, only one or two are now held in much esteem. His best performance is considered to be a *History of the City of Rheims*, which appeared in three volumes, 12mo. in 1756-7. M. Felix de la Salle, however, is understood to have been conjoined with Anquetil in the composition of this work. His *Esprit de la Ligue*, which first appeared in three volumes, 12mo. in 1767, being a history of the troubles which distracted France after the death of Henry III., has also been several times reprinted. Another of his works is his *Précis de l'Histoire Universelle*, a considerable part of which was written in St. Lazare, and which was first published in nine volumes, 12mo. in 1797. This work has been translated into English, Spanish, and Italian, but is not regarded as having much merit. There is also a *History of France* by this writer in fourteen volumes, 12mo., the first of which appeared in 1805: he is besides the author of numerous papers published in the *Memoirs of the Institute*; and of an account of the life of his brother, the oriental scholar. (*Biographie Universelle*; *Biographie Nouvelle des Contemporains*; *Encyclopédie des Gens du Monde*, Paris, 1833.)

ANSBACH, ANSPACH, or ONOLZBACH, formed a portion of the old principality of Ansbach-Baireuth, in the southern part of Franconia, but it is at present merged in the circle of the Rezat, which surpasses every other province of the kingdom of Bavaria in relative population, trade, and manufactures. In more remote times, this principality was an appendage of the Burgraviate of Nuremberg, which fell to the house of Hohenzollern in the twelfth century, and subsequently passed into the possession of the Margraves of Brandenburg. It afterwards became the property of the collateral branch of Baireuth, and, on the extinction of that branch in 1726, descended to the subsequent Margraves of Ansbach-Baireuth. The last of this family, who intermarried with the celebrated Lady Craven, youngest daughter of Earl Berkeley, in 1767, ceded his inheritance to the King of Prussia, his feudal lord, on the 2d December, 1791. The latter, however, was compelled by the French emperor to relinquish it to him in 1806; and Napoleon shortly afterwards made it over to Bavaria, in exchange for Juliers and Berg. Baireuth, the other portion of the united principality, was also extorted from Prussia, after the disastrous conflict at Tilsit, and, by the same distributor of crowns and kingdoms, transferred to the Bavarian sovereign in 1809.

ANSBACH, formerly **ONOLZBACH**, the capital of the extinct principality of that name, and now the capital of the circle of the Rezat in Bavaria, lies in a fertile and richly-cultivated valley, traversed by the river Rezat, and is built round the confluence of that river with the Holzbach, 48° 12' N. lat., 10° 33' E. long., and about thirty miles south-west of Nuremberg. The town is embellished with handsome squares, and public, as well as private, buildings; the regularity with which the new town is constructed, combined with the attractive country which surrounds it, render Ansbach a pleasant residence. The palace of the former Margraves, a handsome structure in the Italian style, though at present a solitude, retains its gallery of paintings and library; and its grounds, which are laid out in the English taste, are still kept up for the recreation of the inhabitants. Ansbach is the seat of a court of justice and court of appeal, as well as of a Protestant consistory; it contains also one of the eighteen royal-gymnasias, or high-schools, schools of design and music, and a society of arts and manufactures. The principal manufactures of the place are earthenware, tobacco, linens, cottons, woollens, and white-lead: the number of its inhabitants, which in 1825 was 14,000, is now between 16,000 and 17,000, and in this respect it ranks as

the seventh town in the Bavarian dominions. The holy fraternity of St. Gumbert, who showed something better than a monkish taste in selecting a site of so much natural beauty for their abiding-place, may be looked upon as the founders of Ansbach. Under its native princes, it gradually grew into a busy, thriving spot; but, at the present day, it partakes in no small degree of the character of a remote quarter in the old town, which has been, not inappropriately, christened '*Ennui*.' The last Margrave, whenever he could persuade himself to abandon the more seductive charms which England, France, and Italy presented, was accustomed to devote himself to the pleasures of the chase and table at his neighbouring seat, Triesdorf, which was better known among his subjects by the name of the 'Falcon's Nest,' and was in high repute throughout the continent for its breed of horses and cattle. The peasantry of Ansbach are distinguished by a singular costume, consisting of a long black frock, scarlet waistcoat with white buttons, black leather breeches, and a Lilliputian round hat. The women of Ansbach are accounted the loveliest and most lively of the Franco-German females. Cronck, a dramatic, and Uz, a lyric, poet, who stand high in the estimation of their fellow-countrymen, were both of them natives of Ansbach, and a monument has been erected to the memory of the latter in the grounds attached to the palace. His translation of Anacreon is remarkable for its elegance and fidelity.

ANSELM, archbishop of Canterbury in the reigns of William Rufus and Henry I., commonly called St. Anselm, was by birth an Italian, and a native of Aosta, a town of the Alps belonging to the Duke of Savoy. He took the monastic habit in 1060, at the age of twenty-seven, at Bec in Normandy, where Lanfranc, afterwards archbishop of Canterbury, was prior. Three years after, when Lanfranc was promoted to the abbacy of Caen, Anselm succeeded him as prior of Bec, and when Herluin the abbot of that monastery died, Anselm became abbot of the house. Anselm came to England about A.D. 1092, by the invitation of Hugh Lupus, Earl of Chester, who requested his aid in sickness. Soon after his arrival, William Rufus, who was ill at Gloucester, also required Anselm's assistance, and finally nominated him (though with great difficulty of acceptance on Anselm's part) to the see of Canterbury, which had lain vacant so long, from Lanfranc's death in 1089, as to touch the king's conscience with remorse. Anselm, having first stipulated for the restitution of the possessions of the see as they had stood in his predecessor's time, was consecrated with great solemnity, December the 4th, 1093. In the following year, when William Rufus was endeavouring to wrest Normandy from his brother Robert, a stinted offer, as the king thought it, of 500*l.* was the first cause of the royal displeasure towards Anselm; followed by further discontent when Anselm desired leave to go to Rome to receive the pall from Pope Urban II., whom the king refused to acknowledge as pope, being inclined to favour the party of his competitor Guibert, or rather being desirous that Anselm should receive the pall from himself. At a great council held at Rockingham castle, when charges were made against Anselm, the majority of the bishops sided with the king, and renounced their canonical obedience to the archbishop, while the temporal barons supported him. During this conflict, Walter, bishop of Alba, the pope's nuncio, brought the pall into England, which it was at last agreed should be carried to Canterbury, and placed upon the altar of the cathedral, whence Anselm was to receive it as if it had been put into his hands by St. Peter himself. In short, the king pretended to be reconciled. He soon, however, took an opportunity of again quarrelling with Anselm for having furnished, as he alleged, an ill-equipped proportion of troops for the expedition against Wales. Anselm, now seeing no probability of terminating his disputes with the king, proposed a visit to Rome to consult the pope, but was personally refused the royal permission to depart. His resolution, however, was fixed: he went a second time to court to ask for leave, and was again refused, but gave his blessing to the king, and embarked at Dover. As soon as the king had ascertained that Anselm had crossed the channel, he seized upon the archbishoprick, and made every act of Anselm's administration void. The archbishop got safe to Rome, and was honourably received by the pope, whom he afterwards accompanied to Capua. Here he wrote a book upon our Saviour's incarnation; subsequent to which he assisted the pope at the synod or council of Bari, where he prevented Urban from excommunicating the king of England for his various and frequent outrages

upon religion. The king, however, by presents and promises, finally bribed the court of Rome to desert Anselm, who retired to Lyons, where (with the interval of an attendance at a council at Rome in 1099) he continued to reside till he heard of William Rufus's death, with that of Pope Urban shortly after. Henry I., immediately upon his accession, invited Anselm to return to England, but fearing his brother Robert's arrival as a competitor for the throne, he was crowned by another prelate. The archbishop was received in England with extraordinary respect both by the king and people, but refusing to be re-invested by the king, and to do the same homage with his predecessors, he again fell under the displeasure of the court; open rupture, however, was deferred till the return of the agents of both parties, who had been sent to Rome. In the interim Anselm summoned a synod to meet at Lambeth, in which it was determined that the king might lawfully marry Matilda, the eldest daughter of Malcolm king of Scotland, although she was generally reported to be a nun: he also rendered signal service to King Henry against his brother, the Duke of Normandy, who had landed at Portsmouth; and gave his aid in preventing some of the nobles of Henry's court from joining in revolt. The agents to Rome now returned. One of them refusing to dispense with Urban's canons, and the king refusing to yield his prerogative, the dispute was still kept up, and rather inflamed in consequence of the majority of the bishops and nobility siding with the king. It was now determined that fresh agents should be sent to Rome: but when they returned, the two parties disagreed as to the answer they had received from the pope: the king's bringing a verbal answer in addition to the written letter. After this, for a short period, the controversy was allowed to sleep. In 1102 another national synod was held under Anselm, at St. Peter's, Westminster, which was attended by the king and principal nobility. In the year following, at the request of the king and barons, Anselm himself took a voyage to Rome, to arrange, if possible, an accommodation; the king, at the same time, in distrust, despatching an agent of his own to the papal court, who arrived before the archbishop. The pope still continued inexorable; but wrote a ceremonious letter to the king, promising compliance in other matters, if the king would but waive the matter of investiture. Anselm, in chagrin, again took up his residence at Lyons: while a fresh embassy to Rome from the king was still more unsuccessful than the former, the pope levelling the heaviest censures of the church against different persons of the English court who had dissuaded the king from parting with the investitures. Anselm now removed from Lyons to the court of Adela, countess of Blois, the king's sister, who, during a visit which Henry I. made to Normandy, contrived an interview between him and Anselm, July 22, 1103, at the castle of L'Aigle, when the king restored to him the revenues of the archbishoprick, but refused permission for Anselm to return to England unless he would comply with the investiture. Anselm, still refusing, remained in France, retiring to the abbey of Bec; and though the English bishops, who till then had sided with the king, now changed their minds, and pressed Anselm to return, he refused, till he was further informed of the proceedings of the court of Rome. At length the ambassadors returned, and announced that the pope, adopting a middle course, refused to give up the investitures, but was willing so far to dispense, as to give leave to bishops and abbots to do homage to the king for their temporalities. This was in 1106. The king now invited Anselm to England, but the messenger finding him sick, the king himself went over into Normandy, and made him a visit at Bec, where all their differences were adjusted. Anselm, being recovered, embarked for England, and, landing at Dover, was received with extraordinary marks of welcome. To omit other circumstances of respect, it is stated that the queen herself travelled before him upon the road, in his return, to provide for his better entertainment. From this time, little that is remarkable occurred in the life of Anselm, excepting a dispute with Thomas, elected archbishop of York in 1108, who, wishing to disengage himself from dependency upon the see of Canterbury, refused to make the customary profession of canonical obedience. Before the termination of this dispute, Anselm died at Canterbury, April 21, 1109, in the seventy-sixth year of his age.

The works of Archbishop Anselm were published first at Nuremberg, folio, 1491; at Cologne in 1573, and 1612; at Lyons in 1630; by Father Gerberon, at Paris, in 1675,

reprinted in 1721; and again at Venice, 1744, in two volumes folio. In the library of Lyons there is a beautiful manuscript of his meditations and prayers. Some of his pieces in the Cologne edition of 1612, and the Lyons edition of 1630, are thought to be suppositions.

Anselm was a man of piety and learning according to the measure of the age in which he lived; but by promoting with zeal and obstinacy the ambitious views of the court of Rome, he involved both his king and country in many troubles, and set an example of opposition which was too well imitated by some of his successors. He was the first who restrained the marriage of the English clergy, by passing the ecclesiastical canons of the years 1102 and 1108. Eadmer the historian, who had been the archbishop's secretary, was the first who wrote his life; and there is another life of him by John of Salisbury, disfigured by the relation of many supposed miracles which the archbishop is said to have wrought. The canonization of Anselm took place in the reign of Henry VII. at the instance of cardinal Morton, then archbishop of Canterbury, a singular mark of veneration for one who had been dead so long. (Godwin, *de Præsulibus*; *Biogr. Brit.* edit. 1778, vol. i. p. 205; Henry, *Hist. Brit.* b. iii. c. 2; Chalmers' *Biogr. Dict.* vol. ii. p. 280.)

ANSER, the goose, a genus of birds which M. Brisson, very properly as we think, separated from the genus *Anas* of Linnæus. Brisson has been followed in this by Baron Cuvier, Vieillot, Lesson, Drapiez, and Fleming; while Latham adheres to Linnæus, and Temminck confines *Anser* to a section of *Anas*. The following are M. Vieillot's characteristics, with some slight modifications. The bill shorter than the head, and higher than wide, but as thick as it is broad, in some species bulged at the base near the forehead, straight, rounded at the point, denticulated with conical and pointed lamellæ; the upper mandible is convex and unguiculated at the tip; the lower mandible is flat and rather narrow. The wings are of moderate length, and on some species furnished with tubercles. The legs are considerably longer, and more in the middle of the body than in *Anas*, and hence geese walk better than ducks. There is no enlargement at the base of the windpipe.

The species, twenty-eight in number, will be described under Goosæ.

ANSON, GEORGE, LORD, was the third son of William Anson, Esq., a gentleman of a good family, long established in Staffordshire. Anson's inclination to the seafaring life discovered itself early. It was his greatest pleasure to read and hear stories of eminent voyagers and admirals; his father, therefore, gave him such an education as was likely to foster and improve the natural bent of his genius. In 1722, he was made master and commander of the Weazel sloop, and the year following was raised to the rank of post-captain, and to the command of the Scarborough man-of-war. In this station in the profession, he was employed on various services, which he discharged with credit.

It was at the breaking out of the Spanish war that he first became an historical character. In 1740, he was appointed to the command of a small squadron, which was ordered to sail for the South Sea, a quarter where no attack was anticipated, to harass the coasts of Chili and Peru, and to co-operate occasionally with Admiral Vernon across the Isthmus of Darien. The scheme was well laid, but frustrated by unaccountable delays in the first instance, and afterwards by some unforeseen accidents. Anson was not able to sail until September; but the dilatoriness which retarded his departure till so late in the year was yet less culpable than the negligence which sent him out with ships ill-fitted for the

dangerous navigation on which he was bound. He doubled Cape Horn, in March 1741, after experiencing most tempestuous weather off that dangerous coast, in which his whole squadron was dispersed. He arrived, with only his own ship the Centurion, at Juan Fernandez, 33° 40' S. lat., 79° W. long., June 10, after suffering for near three months from a series of the most terrific storms, and from the ravages of the scurvy, which in that short time had carried off upwards of 200 from a crew of between 400 and 500 men, and left scarce enough of the remainder in health to work the ship. At that island he was rejoined by the remains of his squadron, consisting of the Gloucester man-of-war, a sloop, and a vessel, called in the phraseology of the times a pink, laden with provisions. His men were now reduced to the number of three hundred and thirty-five. With this small force he left Juan Fernandez in September, kept the Spanish coast for eight months in continual alarm, made prize of several small vessels, and burned the town of Païta. The original design of the expedition being frustrated, he conceived the project of intercepting the Manila or Acapulco galleon, a Spanish ship laden with bullion and other valuables to a vast amount, which sailed annually between Acapulco in Mexico, and Manila, one of the Philippine islands. With this view he hovered on the west coast of America till May, 1742, when he set sail to cross the Pacific Ocean. In the course of this voyage, the Gloucester and the other vessels were destroyed for want of men to navigate them, and he proceeded with only the Centurion, and that but half manned, owing to the sickness and mortality which had thinned the crews. The hardship endured on this part of the voyage was extreme, from the shattered condition of the ship, as well as the prevalence of scorbutic disorders. The first land which the voyagers made was the uninhabited island of Tinian, one of the Ladrões, of which a most fascinating description is given. Here the commodore remained some time to refresh his crew; and his constancy and equanimity were signally shown during this period. The Centurion was driven from her moorings out to sea, leaving himself and the greater part of the sailors and officers on shore. In this emergency his calmness and spirits never failed. He gave orders immediately for the construction of a vessel, engaging personally in the most laborious employments; and the greatness of his anxiety would have remained unknown, but for his transports of joy on the unhoped return of the Centurion.

The health of the crews being in some degree recruited, Anson proceeded on his course to China; and arrived at Macao, an island and town in the bay of Canton, November 12, 1742. He remained there till the beginning of 1743, during which interval the vessel was new-sheathed, and a reinforcement of sailors procured. He now resumed his design of intercepting the Spanish galleon, and he steered his course back to the Straits of Manila. He met and took her after a short but sharp engagement, June 20. In the moment of victory, a fire broke out near the powder-room of the Centurion, the extinction of which was owing to the commodore's calm promptitude. The prize was mounted with forty guns, manned by six hundred sailors, and laden with treasure and effects to the value of 313,000*l*. He returned to China for the purpose of selling her; and thence proceeded round the Cape of Good Hope to England, and arrived at Spithead in safety, June 15, 1744. The contrast between the disasters of the earlier and the good fortune of the latter half of his voyage is remarkable, for dangers beset him to the last. On his arrival in England, he discovered that he had passed in a fog through the midst of a French fleet then cruising in the Channel. The commander himself was enriched by this expedition, and the character of Great Britain for skilful and intrepid seamanship was confirmed and heightened; but in a political view, the nation was not indemnified for the expense. The object, as general measure of warlike operations, was frustrated. The lying in wait for the Manila ship was an afterthought; had the chapter of accidents, so eventful in maritime occurrences, terminated unfavourably in spite of all his vigilance, he might have been superannuated on his return to England, and have died in obscurity. But his talents as an officer were rendered influential by his wealth; he was heard as an oracle in all naval deliberations, and rose by uninterrupted gradations to the highest honours of his profession, and also to the peerage.

Soon after his return, Anson was appointed Rear Admiral

of the Blue, and one of the Lords of the Admiralty. In April, 1745, he was made Rear-admiral of the White, and in July, 1746, Vice-admiral of the Blue. He was also elected parliamentary representative of the borough of Heydon, in Yorkshire. During the winter of that year, he commanded the Channel squadron in a long and tempestuous cruise. In the following spring, May 3, being in command of a powerful fleet of fourteen ships, besides a sloop, and fireship, he fell in with two combined French fleets, bound to the East and West Indies, laden with merchandise, treasures, and warlike stores, protected by a strong convoy. On this occasion he captured six ships of war, not one escaping, together with four armed East Indiamen. M. de St. George, captain of the *Invincible*, on presenting his sword to the conqueror, said, in allusion to the names of two of the captured ships, in the characteristic epigrammatic style of French compliment, 'Sir, you have conquered the *Invincible*, and carry Glory in your train.'

For his signal services, King George II. rewarded Admiral Anson with a peerage, by the title of Lord Anson, Baron of Soberton, in Hants. In the same year he was appointed Vice-admiral of the Red; and on the death of Sir John Norris, Vice-admiral of England, an appointment rather of a civil than a naval character, but always given to a naval man. In 1748, he was appointed Admiral of the Blue, and commanded the squadron which conveyed George II. to and from Holland. He ever after attended the king in his voyages to the Continent. In 1751, he was appointed First Lord of the Admiralty, in which station he continued, with a very short interval, till his death. The occasion of his temporary retirement was the unpopularity incurred by the government in consequence of the untoward events of which Admiral Byng was the victim: but those events belong more properly to the political history of the period, than to the personal transactions of Lord Anson's life.

In 1758, being then Admiral of the White, he hoisted his flag on board the *Royal George*, 100 guns, and sailed from Spithead on the 1st of June. Sir Edward Hawke commanded under him. By cruising continually before Brest, he covered the descent which was made that summer at St. Maloes and Cherbourg. On the accession of George III., he was appointed Admiral and Commander-in-chief of his Majesty's fleets. He died suddenly, June 6, 1762, aged 65, at his seat at Moor Park, in Hertfordshire, having for some time been in a shattered state of health. He married the eldest daughter of Lord Chancellor Hardwicke, who died before him without issue.

His professional characteristics were those of discretion, coolness, and steadiness. In contemplating the risk of his own ship being lost in doubling Cape Horn, he gave such directions to the other commanders as were calculated to secure the success of the voyage. At Juan Fernandez he set the example, and compelled his officers to assist, in carrying the sick sailors, in their hammocks, ashore. He sowed garden seeds, and planted fruit trees in that island, for the benefit of future voyagers. He was a strict disciplinarian, and his methods were attended with such success, that at the taking of Paita, only one of his men so far neglected his duty as to get drunk. When discussions arose concerning the distribution of the plunder seized there, he showed his generosity by throwing up his own share to augment the portions of his officers and men. His humanity was eminently displayed in his kind treatment of his prisoners; by which he won the admiration and respect of the American Spaniards, and did much to remove the opinion of the excessive cruelty of the English, arising out of the atrocities committed in past times by the buccaneers. He directed his attention to the improvements of geography and navigation, by making careful surveys of the coasts which he visited. It has been said that he was addicted to gambling, and a dupe to sharpers. The charge is contradicted by Dr. Kippis in the *Biographia Britannica*; but the apologist contents himself with stating that 'upon the whole he neither won nor lost by gaming; and he made it, like hundreds of others who pass uncensured, his amusement rather than his business.' A witty remark that 'he had been round the world, but never in it,' was probably, like many similar sayings, hazarded for the sake of the point rather than for its strict applicability. *Lord Anson's Voyage round the World* went through four large impressions the first year, and has been translated into most Euro-

pean languages. It was written by Mr. Benjamin Robins, from materials furnished by Lord Anson, and digested under his own inspection. A journal of Anson's voyage was published in 1745, by Pascoe Thomas, teacher of the mathematics on board the *Centurion*.

ANSTEY, CHRISTOPHER, a poet of the last century, born October 31, 1724, now little known except as the author of the *Bath Guide*. He received the rudiments of his education at the free school of Bury St Edmunds, whence he was removed to Eton; and in due time succeeded to a fellowship at King's College, Cambridge. He took his bachelor's degree in 1746, but was prevented from proceeding at the regular time to the degree of M.A., by a whimsical quarrel with the University authorities. In consequence of this, he was refused his master's degree, in 1749; but he continued to hold his fellowship, and occasionally resided at college.

On his mother's death, in 1754, he succeeded to the estates of his maternal grandfather, at Trumpington, near Cambridge, and resigned his fellowship. In the year 1766 he published his *Bath Guide*, a satire on the follies of fashionable life, especially as developed at that gay watering-place. This is one of the lightest, wittiest, and most amusing satires of the kind in the English language, and obtained great popularity; inasmuch, that Dodsley the bookseller, who had purchased the copyright for 200*l.*, after two editions had been published, returned it to the author in 1777, stating that he had made more by it than he ever had made by any book in the same length of time. It should be mentioned to Mr. Anstey's honour, that he presented the profits of the work to the General Hospital of Bath. The merits of the work are tarnished by a broadness of humour, and an occasional irreverence in speaking of things connected with religion, which, though aimed at hypocrisy, and not intended to bring true religion into contempt, would scarcely be tolerated in the present day. The manners and follies which this lively *jeu d'esprit* was written to commemorate, have passed away; and from the combined effect of these two causes, it is probable that the *Bath Guide* will be little known to the rising generation.

Mr. Anstey wrote several poetical pieces of no great length, which are collected in one volume quarto, with a memoir of his life prefixed by his son. The most remarkable of them is the *Election Ball*, written much in the same strain as the *Bath Guide*. This he translated into Latin verse; as well as a selection from Gay's *Fables*, Gray's *Elegy*, and some other pieces. He was fond of this exercise, and versified with elegance and correctness. He spent the latter years of his life at Bath, and died there in 1805.

ANSTRUTHER EASTER and WESTER, two royal burghs in Fifeshire, Scotland; situated on the sea-coast facing the S.S.E., and on each side of the mouth of a small rivulet, about 35 miles N.E. by N. of Edinburgh. Anstruther Easter is considerably the larger place of the two, having a population (in 1831) of 1007 persons: Anstruther Wester has only 430. Till the year 1636 Anstruther Easter was in the parish of Kilrennie, but was then erected into a separate charge and the church built. It is in the Presbytery of St. Andrew's and the Synod of Fife: Sir John Anstruther is the patron. In 1710 it was made a port, and the custom-house established; and, in 1753, a new quay was erected. The town lies low, and the only good street is that which runs along the quay. Ship-building, tanning, and fishing, are the chief occupations of the inhabitants. There is a post-office. Lat. 56° 14' N., long. 2° 44' W. of Greenwich.

Anstruther Wester was made a royal burgh in 1583, having been previously a burgh of Barony. The parish church is a very ancient structure. The inhabitants were zealous covenanters in the time of Charles I., and suffered severe loss in the battle of Kilsyth against the Marquis of Montrose in 1645. The author of the account of this parish in Sir John Sinclair's *Statistical Account of Scotland*, remarks with great naïveté, 'Since the battle of Kilsyth the people here have a strong aversion to a military life.' The town was further injured, to a great extent by two inundations of the sea, one in 1670, which destroyed or choked up the harbour, and another towards the end of the same century, which destroyed about one-third of the town. The rock on which the town-house once stood is covered by the sea every spring-tide. The trade of this and other towns on this part of the coast is thought to have suffered from the union with England. The harbour does not admit ships of burden; but a little to the westward

is a creek, called Westhaven, much used in the fishing season, which might easily be made a good harbour.

The creek between Easter and Wester Anstruther is said to have been the seat of a considerable salmon fishery. A variety of fish is still caught and sent to Edinburgh, Glasgow, and other places: lobsters are sent to London. Several vessels belong to these towns; and some coarse linens are made in the different families. The Anstruthers are included in the St. Andrews' district of burghs, which district returns one member to parliament.

Opposite to the Anstruthers is the Isle of May, a mile long and three-quarters of a mile broad, which is considered an excellent place for improving the fleeces of sheep kept there, though only for one season: there is a lighthouse on it.

ANT (*Formica*), a well-known genus of insects, which has attracted attention from the earliest ages, on account of the singular economy and extraordinary industry manifested by the different species. In various parts of the three volumes on insects in the *Library of Entertaining Knowledge*, numerous minute details are given of the interesting proceedings of ants; but at present we shall confine ourselves to a more brief but more methodical outline of their natural history. In tracing the history of most insects, it is best, perhaps, to begin with the eggs; but in the case of the ant, the laying and hatching of the eggs could not be well understood without an acquaintance with their singular manner of pairing, with which, therefore, we shall begin.

Pairing of Ants.—It may be necessary to premise here, that, similar to bees, a community of ants, whatever the species may be, consists of males, which have always four wings; of females, much larger in size than the males, which only possess wings during the pairing season; and of a sort of barren females, which have been variously termed neuters, workers, or nurse-ants, and which, so far as we know, have never been observed to have wings in any stage of their existence.

If an ant hill be examined any time after mid-summer up to the close of autumn, there may be seen, mixed with the wingless workers, a number of both males and females furnished with white glistening wings. These, however, are neither kings nor queens in the state, at least so far as freedom of action is concerned, for they are not allowed to move without a guard of workers to prevent their leaving the boundaries, and if one straggles away unawares, it is for the most part dragged back by the vigilant sentinels, three or four of whom may, in such cases, be seen hauling along a single deserter by the wings and limbs. The workers, so far from ever facilitating the exit, much less the departure, of the winged ones, more particularly the females, guard them most assiduously in order to prevent it; and are only forced to acquiesce in it when the winged ones become too numerous either to be guarded or fed. There seems, indeed, to be a uniform disposition in the winged ones to desert their native colony; and as they never return after pairing, it would soon become depopulated in the absence of females. The actual pairing does not seem to take place within the ant-hill, and we have observed scouts posted all around, ready to discover and carry back to the colony as many fertile females as they could meet with. Nay, we are quite certain that whole colonies have been thus dispersed; and when they did not find fertile females near their encampment, they have gone farther and farther till they found them, and, if they had gone very far, never returned, but commenced a number of new establishments, according to their convenience. It is probable that, soon after pairing, the males die, as do the males of bees and other insects; for, as the workers never bring any of them back, nor take any notice of them after leaving the ant-hill, they must perish, being entirely defenceless, and destitute both of a sting and of mandibles to provide for their subsistence. The subsequent proceedings of the females are very different, and of curious interest. It was supposed by the antiquaries that all ants, at a certain age, acquired wings; but it was reserved for the younger Huber, in particular, by means of his artificial fornicaries, to trace the development of the wings in the female from the first commencement, till he saw them stripped off and laid aside like cast clothes.

This curious process, which was first hinted at by Gould in his interesting account of *English Ants*, we have repeatedly witnessed,—the females extending their wings, bringing them over their heads, crossing them in every direction, and throwing them from side to side, till at length they are disjointed from the body and fall off. Those, however, who

are desirous of verifying the observation, must procure winged females immediately after pairing, and place them under a glass with some moist earth.

Foundation of Colonies.—Some of the females are, after pairing, usually captured by the working ants, and conducted back to the parent community; and others are laid hold of by straggling parties of from two to a dozen workers, who do not return to the parent community, but commence small colonies on their own account. This explains the common occurrence of a great number of small colonies being formed in the immediate vicinity of each other, while sometimes the parent community is thereby quite broken up and the hill deserted. This happens frequently in the case of the red ant (*Myrmica rubra*) and the ash-coloured ant (*Formica fusca*), both very common species in fields and gardens. In the case of the yellow ant (*F. flava*) again, and the wood ant (*F. rufa*), this rarely occurs, the parent community often remaining in the same spot for years together.

When a female, after pairing, does not chance to fall in with any scouting parties of workers, she proceeds without their assistance to found a colony herself in the same manner as is always done by the females of the social wasps and humble bees every spring. We have repeatedly verified this fact, both by confining a single female after pairing, and witnessing her proceedings, and by discovering in the fields single females occupied in laying the foundations of a future city for their progeny. We have met with these single females when they have just begun to form the first cell for the reception of their eggs; when the eggs have just been laid; when the eggs have been hatched; and also when a few workers had been reared to assist in the common labours. To verify the latter observations, however, many hundreds of stones must be turned over in August or September in a place where ants abound; and even with all this the naturalist will probably not discover more than three or four solitary females at work in the course of a season. We have ourselves met with only ten or a dozen instances in the course of several years.

The Laying and Hatching of the Eggs.—The younger Huber says, 'Having directed my close attention to the eggs of ants, I remarked that they were of different sizes, shades, and forms. The smallest were white, opaque, and cylindrical; the largest transparent, and slightly arched at both ends; while those of a middle size were semi-transparent. On holding them up to the light, I observed a sort of white oblong cloud; in some, a transparent point might be remarked at the superior extremity; in others, a clear zone above and underneath the little cloud. The largest presented a single opaque and whitish point in their interior. There were some whose whole body was so remarkably clear as to allow of my very distinctly observing the rings. On fixing attention more closely upon the latter, I observed the egg open, and the grub appear in its place. Having compared these eggs with those just laid, I constantly found the latter of a milky whiteness, completely opaque, and smaller by one-half, so that I had no reason to doubt of the eggs of ants receiving a very considerable increase in size; that in elongating they become transparent, but do not at this time disclose the form of the grub, which is always arched.'

Contrary to what takes place in most insects, the eggs of ants are not, when laid, glued to any fixed place, but are found in parcels of half a dozen or more loosely attached, so that they can be removed at pleasure during the hatching. It has been shown in the *Penny Magazine*, (vol. i. p. 60,) by a series of minute observations, that the female earwig moves her eggs with the utmost care from a place which she judges too dry, to one which is sufficiently moist; and in the same way the female ant, when she founds a colony without assistance, or the nurse-ants in a community, change the situation of the eggs according to the state of the weather or of the day and night,—a circumstance first observed by Dr. King in the reign of King Charles II. Heat being indispensable to their successful hatching, the eggs are carefully placed during the day near the surface of the ant-hill, but so sheltered from the direct influence of the sun as to prevent the too rapid evaporation of their moisture. During the night, or in cold weather, the eggs are not placed so high, to prevent the radiation and escape of the heat which they naturally possess. The attention to the state of temperature occupies much of the assiduity of the female and the nurse-

When the eggs are at length hatched, (and during this process, we have already seen that they enlarge in size,) the young grubs are similarly treated with respect to temperature, but greater care is now taken to preserve them from too great heat, which might prove more injurious than before hatching.

The grubs are fed by the nurse-ants when any of these are in the colony, and by the mother when she is alone, by a liquid disgorged from the stomach, as is done in a similar way by wasps, humble bees, pigeons, and canary birds. It consequently requires no little industry on the part of a solitary female to procure for herself sufficient food to supply nutriment for a brood of perhaps a dozen or twenty grubs, which are insatiably voracious.

When the grubs are full grown, they spin for themselves cocoons of a membranous texture, and of a brownish-white colour, not unlike barleycorns in appearance, and indeed mistaken for these by early observers,—a mistake which led to the unfounded notion that ants store up corn for winter provision, though, from their always becoming torpid in the winter, they could have no need of this; and even were this not so, they never feed on corn, and would probably starve rather than taste it. The authority of Scripture, which has been supposed to countenance the popular notion, is shown by the Rev. Dr. Harris, Messrs. Kirby and Spence, and others, to have no foundation in the sacred text.

The cocoons are treated precisely like the eggs and the grubs with regard to exposure to heat; and the anxiety of the nurse-ants to shelter them from the direct rays of the sun is taken advantage of on the Continent to collect the cocoons (popularly and erroneously called ants'-eggs) in quantity as food for nightingales and larks. The cocoons of the wood-ant are the only species chosen; and in most of the towns in Germany one or more individuals make a living during summer by the business. In 1832 we visited an old woman at Dottendorf, near Bonn, who had collected for fourteen years. She went to the woods in the morning, and collected in a bag the surfaces of a number of ant-hills where the cocoons were deposited, taking ants and all home to her cottage, near which she had a small tiled shed covering a circular area, hollowed out in the centre, with a trench full of water around it. After covering the hollow in the centre with leafy boughs of walnut or hazel, she strewed the contents of her bag on the level part of the area within the trench, when the nurse-ants immediately seized the cocoons and carried them into the hollow under the boughs. The cocoons were thus brought into one place, and after being from time to time removed, and black ones separated by a boy who spread them out on a table, and swept off what were bad with a strong feather, they were ready for market, being sold for about 4d. or 6d. a quart. We have seen temporary areas made for the same purpose in the woods, but for want of a confining trench of water, many cocoons were carried off by the ants. Considerable quantities of these cocoons are dried for winter food of birds, and are sold in the shops.

In the case of moths, ichneumons, and other insects which spin themselves up in cocoons, the included insect, when the time of its change arrives, is enabled to make its own way through the envelope; but though it would appear, from some observations made by Swammerdam, that ants may, when forced thereto, effect their own disengagement, this is not the usual process. It is the nurse-ants that cut a passage for them with their mandibles, as was first minutely described by Baron de Geer and the younger Huber:—‘Several males and females,’ says the latter, ‘lay in their envelopes in one of the largest cavities of my glazed ant-hill. The labourer-ants assembled together, and appeared to be in continual motion around them. I noticed three or four mounted upon one of these cocoons, endeavouring to open it with their teeth at that extremity answering to the head of the pupa. They began to thin it by tearing away some threads of silk where they wished to pierce it, and at length, by dint of pinching and biting this tissue, so extremely difficult to break, they formed in it a vast number of apertures. To expedite the work, some raised up a little slip cut out in the length of the cocoon, whilst others drew the insect gently from its imprisonment. When the ant was extricated from its enveloping membrane, the body was still confined by another membrane, from which it could not by its own exertions disengage itself. The labourer-ants removed the satin-like pellicle which embraced every part of the body, drew the antennæ gently from their investment, then disengaged

the feet and the wings, and lastly the body, with the abdomen and its peduncle. The insect was now in a condition to walk and receive nourishment, for which it appeared there was urgent need. The first attention, therefore, paid it by the guardians was that of giving it the food I had placed within their reach.’

Labours of the Working Ants.—We have already seen that workers or nurse-ants have to labour assiduously in placing the eggs, the grubs, and the cocoons in due degrees of temperature; that they have to feed the grubs by a liquid disgorged from the stomach, and have to disengage the insect at its period of change from the envelope of the cocoon. They have also to perform the task of forming streets, galleries, and chambers for the habitation and protection of the colony, and they exhibit in the work such perseverance and skill as must excite the admiration of every observer. Many of their processes, indeed, it is not a little difficult to account for and explain, though these have been very carefully investigated, particularly by the younger Huber, in whose work, and in *Insect Architecture*, (p. 254 *et seq.*) may be found copious details of the mining, masonry, and carpentry of various species. We shall here give an instance of each of those operations.

Mining.—There is an interesting species called the sanguinary ant (*F. sanguinaria*, Latreille), reported to have been seen near London, but which is certainly very rare, if it is found in England. In the summer of 1832 we discovered several colonies of this ant on the brow of the heath above Godesberg, on the Rhine, and being desirous of taking a number of them alive to England for the purpose of observing their singular manners, we waited till the beginning of October, when they had ceased to work, and had retired for the winter to their galleries underground. After uncovering the thick coping of dry heath twigs and grass stems which was placed over the subterranean city of the colony so as to defend it from rain and cold, we found several covert-ways dug into the clay, wide enough to allow two or three ants to walk abreast; but not an individual now made its appearance, though some weeks previous we had observed thousands in all the bustle of industry; and we began to fear the whole had migrated elsewhere. Being anxious, however, to see the interior structure, we dug in the direction of the covert-ways to the depth of about six or nine inches, when we came upon a number of chambers communicating with each other by galleries, and from an inch to two or three inches in extent, in each of which a number of ants were lying along the floor in a half torpid state, being so sluggish that they could not be brought to run with their usual agility even when irritated.

The point which we wish to call attention to here is that the whole of the apartments which we laid open, amounting to a dozen or more,—and there were probably as many more to which we did not penetrate, must have been dug out of the solid clay by the jaws (*mandibula*) of these little miners. We deemed it singular that we could see none of the rubbish lying about, which must have been cleared away from the interior, and we can only account for this by supposing the colony long established, and the rubbish battered into the grass by the weather.

In other instances of mining, such as in the case of the turf-ant (*F. Cæspitum*), the clay taken from the interior is built up on the outside, using the herbage for buttresses to support the walls thus formed. In the case of the sanguinary ants, however, we observed nothing of this kind, and do not think they ever employ any exterior masonry.

Masonry.—The most common of our English ants which employ masonry is the yellow ant (*F. flava*), whose hills are so usually found built up in old pastures, a foot or more in height, and from six inches to two feet in diameter. For the materials of their building they are wholly indebted to the soil below, which they quarry out with great assiduity; but as they have no means of tempering the clay when it is dry, they are always forced to execute their principal works in rainy weather. ‘I was,’ says Dr. J. R. Johnson, ‘in the habit of visiting, almost daily, for a month, an extensive nest of red ants, of which a large flat stone formed the roof. During my visits for the first three weeks, scarcely a drop of rain had fallen, and the nest seemed considerably injured by the continual falling in of loose earth, which these little creatures with amazing industry removed, whenever it happened any of the avenues were blocked up. No attempt was ever made towards reparation; but what was my surprise, on visiting my little friends after a two days’ heavy

rain, to find that the repairs were already completed, and that the upper surface of their habitation presented as smooth a surface as if a trowel had been passed over it; yet all their work they had industriously effected by kneading with the rain-water the loose earth into a sort of paste. From the nest being situated in the midst of an extensive heath, where there could be no supply of water, and from its remaining unrepaired during the dry weather, it amounts to a full conviction that ants employ no other cement than water in the construction of their varied habitations.

I have often been surprised at the ingenuity of these little creatures, in availing themselves of contiguous blades of grass, stalks of corn, &c., when they wish to enlarge the boundaries of their abode. As these are usually met with in the erect position, they are admirably calculated for pillars: they, therefore, coat them over with a fine paste of earth, giving them, by additional layers, the solidity they judge necessary for the work on which they are engaged; they then leave them to be consolidated by the wind, and afterwards spring a number of arches, from pillar to pillar, and thus form an extensive saloon. Should they be, at any time, in want of small apartments, they have only to prepare a quantity of moistened earth, and by placing this between the pillars, and carrying it up to the roof, leaving here and there an aperture for entrance, their object is completely attained.

It is remarkable that the greater part of these masonic labours are performed during the night, or at least in gloomy weather.

Carpentry.—The coping which we have already described as placed over the subterranean abode of the sanguinary ants, and which is still more remarkable in the colonies of the wood-ant (*F. rufa*), cannot be referred to any sort of carpentry, for the small sticks and straws of which it is composed are not cut into fitting lengths, but collected in the vicinity of the hill and laid on it after the manner of thatch. The term carpentry, however, will apply most justly to those species which form excavations in the interior of trees, of which the following is an instance observed in 1832.

We had brought into our garden in the beginning of June, a large piece of a willow tree, which had been very curiously worked out by the species usually called the emmet (*F. fuliginosa*, Latreille). The tree, indeed, from which it had been taken, appeared to have been destroyed in a great measure from the extensive excavations of these little carpenters. Yet the portion of the tree alluded to seemed to be singularly strong, when the great number of the cells and their peculiar structure was taken into consideration. The walls of these cells were literally as thin as writing-paper, though not quite so smooth and even, and they were seldom quite parallel, but arranged, some perpendicularly, and others slanting in various directions, worked out, it would appear, upon no previous design, but beginning at any given point, and only limited in extent by the worker discovering his approach to one adjacent. The tact with which they chisel away the wood with their jaws, so as to come so near the next cell without actually cutting into it, cannot well be accounted for on any of the common principles of human mechanism. It cannot be the result of vision, from the worker out looking along the level of the plane, as one of our carpenters would do, and thence working so as not to cut through it; for the wall has, in most instances, though not in all, no free edge along which such a level could be taken by the eye. Hearing might assist them, however, supposing workers to be engaged in chiselling on each side of the partition, but it could appear to be more from touch, or rather that modification of it denominated tact, which enables them to feel, as it were, when they have nearly penetrated the wall, and which consequently warns them to stop.

It is not a little remarkable, that all the wood which is worked out by these ants is tinged of a black colour, giving all their streets and lanes somewhat the appearance of having suffered from fire or of being smoked. M. Huber the younger did not succeed in ascertaining the cause of this black colour. We should conjecture it to arise from iron contained in the saliva of the ants acting on the gallic acid of the wood, in a similar way as the same wood becomes black when cut with a knife. The fine glossy black of the ants themselves may originate from the same chemical principle, and this is rendered more probable from the excavations made by other species, such as the dusky ant, (*F. fusca*, Latreille,) not being tinged with this black colour.

Neither are the excavations of the latter so regular in the form of the cells; and the delicately thin partitions do not occur. We have seen several colonies of the yellow ant (*F. flava*, Latreille) established in trees, though their usual habits lead them to prefer a hedge-bank, the dry ridge of a field, or a small knoll on a common. In none of these, however, had the workers much trouble in making their excavations, the trees being in every instance far gone with the dry rot, and the chambers were consequently as easy to construct as in a knoll of sand. In the instance of the black carpenter-ant (*F. fuliginosa*), on the other hand, the wood of the tree selected for their colony is always hard and tough, the easiness of working it being apparently considered a disadvantage rather than a recommendation. We have usually seen these colonies, therefore, in growing trees, the oak seeming to be preferred to all others; the honeycomb-like work does not seem to stop the vegetation, the tree continuing to put forth leaves and shoots as before it was excavated for the use of the colony. In the instance which gives rise to these remarks, the willow tree was indeed dilapidated and shorn of its leaves and branches, yet was it untouched with dry rot, and the wood was hard and tough.

Food of Ants.—Some species of ants are carnivorous and will eat insects, fruits, and almost anything eaten by other animals, but honey is the most universal favourite among all the species, particularly the excretion of the various species of aphides called honey-dew. It is on this account that, wherever aphides abound, we are always certain to meet with ants carefully attending their motions and greedily drinking the honey-dew, which becomes so injurious to plants when it increases in quantity so as to obstruct the pores of the leaves. It is stated by Huber and some other authors, that during winter the ants imprison some aphides in their cells, or, at all events, take advantage of individuals of the grass aphid (*Aphis Graminum*) in the vicinity of their hills to obtain honey-dew. We strongly suspect there must be some fallacy in this statement; for among numerous colonies which we have carefully examined during winter, we always found the whole population torpid or nearly so, and not inclined to touch even honey when we offered it to them. In the case of the sanguinary ants in Germany already mentioned, we have seen that they had become torpid as early as October, when the weather was still fine and far from being cold. We are therefore of opinion that the statement will be found as void of accurate foundation as that which represents ants as storing up corn for the winter.

Migrations.—We have already seen, under the head of pairing, one principle in operation for spreading around a parent ant-hill a number of young colonies. This indeed may be considered the main principle of migration; but besides this, the whole of a populous ant-hill which has been established for several years will, for some cause beyond our means of tracing, though most probably on account of more convenient forage, at once desert their homes and march to a new station. Among the yellow ants, the emmets, and the wood-ants or pismires, this is by no means common; but it is an every-day occurrence among the red ants, the ash-coloured ants, the turf ants, and others whose colonies never become very populous, and are consequently both more easily moved and more easily provided with lodging.

'Immense swarms of ants,' to use the words of Dr. Roget, 'are occasionally met with, and some have been recorded of such prodigious density and magnitude as to darken the air like a thick cloud, and to cover the ground to a considerable extent where they settled.' Mr. Gleditsch describes, in the *History of the Berlin Academy* for 1749, shoals of a small black ant which appeared in Germany, and formed high columns in the air, rising to a vast height, and agitated with a curious intestine motion, somewhat resembling the aurora borealis. A similar flight of ants is spoken of by Mr. Acolutte, a clergyman of Breslau, which resembled columns of smoke, and which fell on the churches and the tops of the houses, where the ants could be gathered by handfuls. In the German *Ephemerides*, Dr. Charles Rayger gives an account of a large swarm which crossed over the town of Posen, and was directing its course towards the Danube. The whole town was strewn with ants, so that it was impossible to walk without trampling on thirty or forty at every step. And more recently, Mr. Dorthes, in the *Journal de Physique* for 1790, relates the appearance of a similar phenomenon at Montpellier. The shoals moved about in

different directions, having a singular intestine motion in each column, and also a general motion of rotation. About sunset all fell to the ground, and, on examining the ants, they were found to belong to the *Formica nigra* of Linnæus.

Wars and Expeditions to capture Slaves.—In the same way as the bees and the wasps of different hives manifest inveterate hostility when they meet, ants also of the same or of different species assail one another when they meet during their foraging excursions. Besides the individual skirmishes which thence occasionally arise, pitched battles are sometimes fought between the whole or nearly the whole force of populous adjacent colonies. We have never ourselves witnessed any very extensive battles of this kind, such as Huber describes, in which thousands of combatants were engaged, but we have seen as many as fifty of the wood-ants fighting most pertinaciously within the area of a few inches on what were supposed to be the boundaries of their several territories; their bite is so sharp, and the acrid acid which they infuse is so deleterious, that many are thus disabled or killed outright. Huber witnessed on such occasions very extensive carnage.

Besides these skirmishes and battles which occur among all the species, there are whole communities of warrior-ants, as was first discovered by Huber, whose history is so extraordinary as almost to exceed belief. The details indeed have hitherto been credited chiefly, if not solely, on the well-known veracity of Huber; but in the autumn of 1832 we had an opportunity of verifying them both in the Black Forest and in Switzerland, with respect to the species which he terms the Amazon ant, (*P. rufescens*, Latreille,) and on the Rhine with respect to the sanguinary ant.

Both of these species make war on the ants of a different species from themselves, particularly the dusky ant, (*P. fusca*), not for the purpose merely of gratifying a propensity to combat, but to make slaves of the vanquished to do the drudgery of the conquerors at home. The manner in which they proceed in this affair manifests, so far as we can judge, deep design, such as might be ascribed to the counsels of a cunning diplomatist. They do not capture the adult ants and carry them into slavery, but make booty of the eggs and cocoons, which, after the contest is decided,—and the warriors are always conquerors,—are carried off to the Amazonian citadel, and being hatched there, the poor slaves are most probably not aware but that it is their native colony. Huber repeatedly witnessed such expeditions for the purpose of capturing slaves; but though we were not so fortunate, we witnessed, in a great number of instances, the slaves at work for their warlike captors.

The Amazons have not hitherto been found in Britain, and we were unsuccessful in our attempt to bring over from the Black Forest a nest of live ones with their slaves which we had placed in a box for the purpose. We succeeded indeed in bringing safe home two nests of the sanguinary ants already alluded to under *Mining*, together with a number of their slaves, but they all died within two months, having been kept, as we suppose, too warm for their state of winter torpidity, already begun, and they could not, in their half-awakened state, be induced to take any sort of nourishment.

ANT-BEAR, the name commonly given to the *Myrmecophaga jubata* by the English at Demorara. (See next article.)

ANT-EATER, (*Myrmecophaga*, Linnæus,) in zoology, a genus of *Edentata*, distinguished by their total want of teeth and hairy covering. The latter circumstance separates them from the *pangolins* (*Manis*), or scaly ant-eaters of Africa and Asia, which they resemble closely in other respects, as well in their general anatomy as in their food and habits. These two genera form a small but very distinct family of the Cuvierian order *Edentata*, differing from the common animals comprised in that singular group, as well as from all other known mammalia, by their entire deprivation of the organs of mastication, and acquiring an additional interest by the light which their osteological conformation throws upon the structure and organization of the *megatherium* and *megalonix*, those extraordinary antediluvian animals, whose fossil remains have lately attracted so much of the attention, not only of the professed naturalist, but likewise of the public at large. The relations which these extinct inhabitants of a former world bear to another small family of edentulous mammalia have been already pointed out in the article *AI*, and their general organization and affinities will be formally treated under the proper heads, at a future period. We shall therefore merely observe at present, that as the osteo-

logy of their skulls and trunks presents the closest analogies with that of the corresponding parts in the sloths, so the whole construction of their extremities appears to have been formed after the same model as that of the corresponding organs of the ant-eaters. The head of these latter animals, indeed, is altogether different from that of the sloths: not only does it want the organs of mastication, of which they are deficient only in the incisors, but the bones of the face, which in them are short and round like those of apes and monkeys, are prolonged in the ant-eaters, particularly in the great ant-eater, (*M. jubata*), to double the length of the skull. This singular conformation arises from the form of the maxillary or jaw bones, and those of the nose, which form together a kind of long tube, very small in proportion to its length, and almost cylindrical. This prolongation of the muzzle is not carried to so great an extent in either of the other two known species of ant-eaters; but even there the construction here described differs only in degree, and presents, on a more contracted scale, all the characteristics of the *myrmecophaga jubata*.

It is in the construction of the anterior extremities, however, that these animals offer the greatest singularities, and become most important in their relations to the fossil species. The phalanges or joints of the toes, particularly the last, which bear the claws, are formed in such a manner as to permit them to be bent inwards only, as in the sloths; and for this purpose they are provided with very powerful ligaments, which keep them, in a state of repose, bent in along the sole of the foot, and never permit the hand to be completely opened, but only half extended, as we sometimes see in gouty or rheumatic people. The toes themselves are of very unequal size, and even differ in number in different species. The great ant-bear and tamandua have four on the anterior and five on the posterior extremities, whilst the smallest species, called, from that circumstance, *M. didactyla*, has only two on the fore feet and four on the hind. The toes themselves, as in the sloths, are united closely together as far as the claws, and are consequently incapable of any separate or individual motion: but the disadvantages arising from this circumstance are more than counterbalanced by the increased strength which it produces, and the consequent adaptation of the organ to the peculiar purposes of these animals' economy. The claws are all large and powerful, especially that of the middle toe, of which the dimensions are quite enormous. Nor do the ant-eaters, in walking, tread flatly upon the sole of the foot like the generality of mammalia; on the contrary, they rest entirely upon its outer edge, which is provided with a large callous pad for that purpose, whilst their toes being bent inwards along the palms, the sharp points of their powerful claws are preserved from being injured by the friction of the hard ground. In other respects the ant-eaters are remarkable for their long cylindrical tongues, covered with a glutinous saliva, by means of which they entrap and devour the insects upon which they live, and from which they derive their names, both among naturalists and common observers, *myrmecophaga* literally signifying ant-eater. This tongue is protractile, and capable of being extended to a surprising distance beyond the snout: it is nearly twice the length of the whole head and muzzle together, and when not extended is kept doubled up in the mouth with the point directed backwards. The eyes are particularly small, the ears short and round, the legs robust and amazingly powerful, but so unfavourably formed for locomotion, that the pace of these animals is almost as tardy as that of the sloths themselves, their greatest exertions not enabling them to surpass the ordinary walk of a man. The tail is always long: in the great species lax and thickly covered with very long flowing hair, in the other two, strongly prehensile and naked underneath. These species consequently climb trees and reside principally among their branches, feeding upon the wild bees and termites which inhabit the same situations: the great ant-bear, on the contrary, never quits the surface of the earth, and confines his depredations entirely to the numerous species of large ants which inhabit his native regions, and furnish him at all times with an abundant and easily procured nutriment. The whole genus is confined to South America, and contains at present only three distinct and well-defined species.

1. The *Great Ant-bear*, (*M. jubata*, Lin.) called *gnou-roumi* or *yogui* by the Guaranis, *tamandua* by the Portuguese, *tamanoir* by the French of Cayenne, and *ant-bear* by the English and Spaniards, is a large animal which mea-

tures, when full grown, four feet and a half from the extremity of the snout to the origin of the tail. The tail itself is three feet three inches in length, reckoning to the extremity of the hair, or measured only along the stump, two feet four inches; the head, thirteen inches and a half from the snout to the base of the ear, and ten inches and a half to the anterior angle of the eye; its circumference immediately before the eyes, where it is the thickest, is fourteen inches, but from this part it gradually diminishes to the end of the muzzle, where it measures only five inches and a quarter. The height of the animal at the shoulder is three feet three inches, and at the croup only two feet ten, because, being

[Great Ant-eater, *M. jubata*.]

perfectly plantigrade, it necessarily stands lower on the hind legs than before, as may be observed in the common bear, the badger, and other species which partake of the plantigrade formation of the extremities. The ear is short and round, being an inch and a quarter broad at the base, and only an inch in length: the eye is remarkably small, deeply sunk in the head, and with a naked eyelid; the head and snout, as already observed, are prolonged to a remarkable degree; they are in form almost cylindrical, and end in a small truncated muzzle, having the nostrils and mouth placed at its extreme end: the latter is so small that its whole width scarcely exceeds an inch, and the jaws are of equal length. The tongue is almost cylindrical, fleshy, extremely flexible, and capable of being protruded to the distance of sixteen or eighteen inches. The toes of the anterior extremities, four in number, are of unequal length, the innermost being the smallest and weakest of all; the second measures two inches and a half in length, and is provided with a powerful crooked claw nearly two inches long, sharp pointed, and trenchant on its under surface; the third, which is the largest of all, has a similar claw two inches and a half in length; and the fourth, or exterior toe, is provided with a smaller and weaker claw, like that of the innermost. All these claws, when in a state of repose, are kept bent inwards, and only extended, or rather half-extended, (for the animal cannot open the fingers farther,) when used for defence, or for breaking through the hard external crust of the ant-hills. For these purposes, however, its otherwise awkward conformation gives it an aptitude altogether peculiar, and such is the known power of the ant-bear, that nothing upon which he has an opportunity of fastening has any chance of escaping from the tenacity of his hold, as even in death, the structure of his legs and claws prevents them from being unclosed. The slowness of his motions, however, gives him but little chance against the activity of his most formidable enemies. Notwithstanding the exaggerated accounts which Buffon has recorded of the ant-bear successfully opposing the attacks even of the jaguar, we are assured by don Felix d'Azara, that he has not the slightest chance against this powerful animal, and that a very slight blow on the snout is sufficient to despatch him. The hind feet have five toes of nearly equal length, and all armed with short weak claws, quite useless as instruments of defence, and more resembling the claws of ordinary quadrupeds.

The toes both before and behind are covered with one common integument, and are only distinguishable by their separate claws. The hair, over the whole body, is coarse, hard, and dry, resembling in texture the bristles of the wild boar, but in some parts flattened, and assuming the appearance of long, withered grass. That of the head is short and close, but, over all the rest of the animal, it is long and shaggy, particularly on the top of the neck and along the back, where it forms a kind of long mane, and on the tail, where it is a foot in length, and hangs down on each side, sweeping the ground when the ant-bear walks.

The prevailing colour on the head, face, and cheeks of the ant-bear is a mixture of grey and brown; that on the upper parts of the body and tail is deep brown, mixed with silvery white. A broad black band, bordered on each side with a similar one of a white or light greyish-brown colour, commences on the chest, and passes obliquely over each shoulder, diminishing gradually as it approaches the loins, where it ends in a point. The sides, arms, and thighs are silvery grey, with a slight mixture of brown, marked with two deep black spots, one on the carpus, and the other on the toes; the hind legs are almost perfectly black, and the breast and belly of a deep brown, almost equally obscure.

The habits of the great ant-bear are slothful and solitary; the greater part of his life is consumed in sleeping, notwithstanding which, he is never fat, and rarely even in good condition. When about to sleep, he lies upon one side, conceals his long snout in the fur of the breast, locks the hind and fore claws into one another, so as to cover the head and belly, and turns his long bushy tail over the whole body in such a manner as to protect it from the too powerful rays of the sun. The female bears but a single young one at a birth, which attaches itself to her back, and is carried about with her wherever she goes, rarely quitting her, even for a year after it has acquired sufficient strength to walk and provide for itself. This unprolific constitution, and the tardy growth of the young, account for the comparative rarity of these animals, which are said to be seldom seen, even in their native regions. The female has only two mammae, situated on the breast, like those of apes, monkeys, and bats.

In its natural state the ant-bear lives exclusively upon ants, to procure which it opens their hills with its powerful crooked claws, and at the moment that the insects, according to their nature, flock from all quarters to defend their dwellings, draws over them his long flexible tongue, covered with glutinous saliva, to which they consequently adhere; and so quickly does he repeat this operation, that we are assured he will thus exert his tongue and draw it in again covered with insects, twice in a second. He never actually introduces it into the holes or breaches which he makes in the hills themselves, but only draws it lightly over the swarms of insects which issue forth, alarmed by his attack. 'It seems almost incredible,' says Azara, 'that so robust and powerful an animal can procure sufficient sustenance from ants alone; but this circumstance has nothing strange in it for those who are acquainted with the tropical parts of America, and who have seen the enormous multitudes of these insects, which swarm in all parts of the country to that degree, that their hills often almost touch one another for miles together.' The same author informs us, that domestic ant-bears were occasionally kept by different persons in Paraguay, and that they had even been sent alive to Spain, being fed upon bread and milk, mixed with morsels of flesh minced very small. Like all animals which live upon insects, they are capable of sustaining a total deprivation of nourishment for an almost incredible time.

The great ant-bear is found in all the warm and tropical parts of South America, from Colombia to Paraguay, and from the shores of the Atlantic to the foot of the Andes. His favourite resorts are the low swampy savannahs, along the banks of rivers and stagnant ponds, also frequenting the humid forests, but never climbing trees, as falsely reported by Buffon, on the authority of La Borde. His pace is slow, heavy, and vacillating; his head is carried low, as if he smelled the ground at every step, whilst his long shaggy tail, drooping behind him, sweeps the ground on either side, and readily indicates his path to the hunter; though, when hard pressed, he increases his pace to a kind of slow gallop, yet his greatest velocity never half equals the ordinary running of a man. So great is his stupidity, that those who encounter him in the woods or plains may drive him before them by merely pushing him with a stick, so long at least

as he is not compelled to proceed beyond a moderate gallop; but if pressed too hard, or urged to extremity, he turns obstinate, sits up on his hind quarters like a bear, and defends himself with his powerful claws. Like that animal, his usual, and indeed only, mode of assault is by seizing his adversary with his fore-paws, wrapping his arms round him, and endeavouring, by this means, to squeeze him to death. His great strength and powerful muscles would easily enable him to accomplish his purpose in this respect, even against the largest animals of his native forests, were it but guided by ordinary intelligence, or accompanied with a common degree of activity. But in these qualities there are few animals, indeed, which do not greatly surpass the ant-bear; so that the different stories handed down by writers on natural history from one to another, and copied, without question, into the histories and descriptions of this animal, may be regarded as pure fictions. For this statement we have the express authority of Don Felix d'Azara, an excellent observer and credible writer, from whose Natural History of the Quadrupeds of Paraguay we have derived the greater portion of the preceding account of the habits and economy of this extraordinary animal. 'It is supposed,' says Don Felix, 'that the jaguar himself dares not attack the ant-bear, and that if, pressed by hunger, or under some other strong excitement, he does so, the ant-bear embraces and hugs him so tightly, as very soon to deprive him of life, not even relaxing his hold for hours after life has been extinguished in his assailant. It is very certain that such is the manner in which the ant-eater defends himself; but it is not to be believed that his utmost efforts could prevail against the jaguar, which, by a single bite or blow of his paw, could kill the ant-eater before he was prepared for resistance; for even in so extreme a case, his motions are so slow and so heavy, that he takes some time to get himself ready, and besides being unable to leap, or turn with even ordinary rapidity, he is necessarily forced to act solely upon the defensive.' The flesh of the ant-eater is esteemed a delicacy by the Indians and negro slaves, and, though black, and of a strong musky flavour, is sometimes even met with at the tables of Europeans.

Tamandua, *M. tamandua*.]

2. The *Tamandua*, (*M. tamandua*, Cuvier,) or second species of ant-eater, is an animal much inferior to the great ant-bear in point of size, being scarcely so large as a good-sized cat, whilst the other exceeds the largest greyhound in length, though, from the shortness of its legs, it is much inferior in height. The head of the tamandua is not so disproportionately long and small as that of the great ant-bear. It is, however, of the same general cylindrical form, and equally truncated at the extremity, having the nostrils and mouth situated in the same position, and equally minute; when compared with the size of the animal. Its whole length, from the extremity of the muzzle to the root of the ear, is five inches, and to the anterior angle of the eye, three inches; the body, from the muzzle to the origin of the tail, measures two feet two inches, the tail itself being one foot four inches and a half more; the height at the shoulder is one foot three, and at the croup an inch lower; the length of the ear is an inch and a quarter, its greatest breadth than inch, and the greatest circumference of the head, that, namely, taken immediately in front of the ears, eight inches and a quarter. The conformation of the extremities, and the number of the toes both before and behind, is in every respect the same as in the great ant-eater already described;

but the tamandua differs from this animal particularly in the prehensile power of its tail, which makes it essentially an arboreal quadruped, and altogether changes the most striking traits of its habits and economy. The hair over the entire body, also, is of a very different texture; instead of being long, harsh, and shaggy, as in the great ant-bear, it is short, shining, and of a consistence something between the qualities of silk and wool; standing out from the body like the latter, and of the same uniform length in every part. The colours of this species, however, are by no means so uniform and invariable as those of the species already described; on the contrary, they differ more in the tamandua, according to the individual, than perhaps in any other known animal in a state of nature. Accordingly many eminent naturalists are disposed to consider them as forming distinct species, rather than mere varieties of the same; and it is not improbable that, when we come to be better acquainted with this animal in its native woods, their opinion may be, at least partly, confirmed.

The eyes of the tamandua are minute, the ears small and round, the body long and cylindrical, the legs short and robust, the tail round and attenuated, covered with very short hair throughout its greater part, but naked underneath towards the point, and strongly prehensile. The following are the principal varieties, as regards the colours:—

1. The *straw-coloured Tamandua*, of a uniform straw-colour over the whole body, with a transverse triangular band passing obliquely over each shoulder, and encountering that from the opposite side, on the median line of the back. This band is only apparent in particular lights, and is not produced by any difference of colour, but merely by a difference of shade, arising from the hair having an opposite inclination, or direction, from that on the rest of the body.

2. The second variety is, like the former, of a uniform straw colour, but has a good deal of black about and particularly in front of the eye. This variety is found in Paraguay, and is described by Azara, who suspects its colours, as well as those of the preceding, to arise from immaturity of age, an opinion which seems to be well founded.

3. The third variety is of a silvery-white colour, with a dirty brown band running transversely over each shoulder.

4. The fourth variety is of the same silvery-white as the last, with similar dirty brown bands on the shoulders, and, besides, the croup, flanks, and belly of the same obscure colour.

5. The fifth is of a uniform clear brown, over all parts of the body, without any appearance of bands on the shoulders, or mixture of any other colour; and

6. The sixth and last variety is entirely black, with a little light brown under the tail. This variety is described by Azara, who found it in Paraguay, and who reports that it has proportionally shorter hair and larger claws than the other varieties.

The tamandua is an inhabitant of the thick primeval forests of tropical America; it is never found on the ground, but resides exclusively in trees, where it lives upon termites, honey, and even, according to the report of Azara, bees, which in those countries form their hives among the loftiest branches of the forest, and, having no sting, are more readily despoiled of their honey than their congeners of our own climate. When about to sleep, it hides its muzzle in the fur of its breast, falls on its belly, letting its fore-feet hang down on each side, and wrapping the whole tightly round with its tail. The female, as in the case of the great ant-eater, has but two pectoral mammae, and produces but a single cub at a birth, which she carries about with her, on her shoulders, for the first three or four months. The young are at first exceedingly deformed and ugly, and of a uniform straw-colour.

This animal is called *cagouaré* by the Guaranis, on account of the noxious and infected vapours of the forests in which alone it is found, the word literally signifying, in the language of these Indians, the inhabitant of a stinking wood or marsh. Such at least is Azara's interpretation of the term, though it appears more probable that it may refer to the strong disagreeable odour of the animal itself, which, this very author informs us, is so powerful that it may be perceived at a very great distance, particularly when the animal is irritated. *Tamandua* is the name by which it is known to the Portuguese of Brazil; the French and English call it *fourmillier* and little ant-bear.

It is difficult to imagine how M. de Buffon could have

been so far led astray as to mistake the stuffed skin of a *cati-mondi* for this animal, particularly after the severe though just criticism which he passes upon Leba for a similar mistake. A single glance at the plate of Buffon (*Hist. Nat., Suppl.* tom. ii. tab. 56) is sufficient to convince any person who ever saw a coati, or who has any idea of the animal, of the real genus to which it belongs. Both Azara and Baron Cuvier long since exposed this error; yet, strange to say, notwithstanding his perfect knowledge of this circumstance, M. Desmarest, in general a very acute observer, commits himself the very identical mistake which he criticises and condemns in Buffon: giving, for a real ant-eater, a plate in the *Atlas to Krusenstern's Voyage*, which, though not of the very first order of engravings, yet very tolerably represents a coati in the act of killing and devouring a serpent. This latter circumstance alone is sufficient to show that the animal represented cannot be an ant-eater, even if the engraving itself left the question doubtful, which it does not. It is only surprising that so acute a zoologist as M. Desmarest could ever have committed the error, though,

he have copied his mistake, without taking the trouble to inquire into the matter.

[Little Ant-eater, *M. di baryla*.]

3. The *little Ant-eater* (*M. di baryla*, Lin.) is easily distinguished from the other two species, not only by its size, which does not exceed that of the common European squirrel, but likewise by the number of its toes, being four on the

or at only two on the anterior extremities. The form and general proportions of its body resemble those of the tamandua, only on a very reduced scale. Its whole length, from the snout to the origin of the tail, is but six inches, that of the head not quite two inches, and of the tail seven inches and a quarter. This organ is consequently rather longer than the body: it is thick at the root, and covered with short fur, but tapers suddenly towards the point, where it is naked and strongly prehensile. The muzzle is not so long, in proportion, as in the other two species: the tongue also is shorter, and has a flatter form: the mouth opens farther back in the jaws, and has a much larger gape, the eye being situated close to its posterior angle: the ears are short, rather drooping, and concealed among the long fur which covers the head and cheeks; the legs are short and stout, and the hair very fine and soft to the touch, three quarters of an inch in length on the body, but much shorter on the head, legs, and tail. The general

colour is that of straw, more or less tinged with maroon on the shoulders, and particularly along the median line of the back, which usually exhibits a deep line of this shade. This species is said to have four mammae, two pectoral, as in those already described, and two others on the abdomen. It is reported, nevertheless, to have but a single cub at a birth, which it conceals in the hollow of some decayed tree. The native countries of the little ant-eater are Guyana and Brazil, beyond which it appears not to extend farther towards the south, since Azara is not only unacquainted with it, but imagines, from Buffon's and Daubenton's descriptions, that it must be the young of his tamandua. The habits and manners of this little animal, hitherto very imperfectly known to naturalists, are so well described by Von Sack, in his *Narrative of a Voyage to Surinam*, a book little known to general readers, that we cannot avoid quoting the entire passage which refers to it.

'I have had,' says he, 'two little ant-eaters or fourmilhiers, which were not larger than a squirrel: one was of a bright yellow colour, with a brown stripe on the back; the other was a silvery grey and darker on the back; the hair of each was very soft and silky, a little crisped; the head was small and round, the nose long, gradually bending downwards to a point; it had no teeth, but a very long round tongue: the eyes were very small, round, and black; the legs rather short: the fore-feet had only two claws on each, the exterior being much larger and stronger than the interior, which exactly filled the curve or hollow of the large one: the hind-feet had four claws of a moderate size; the tail was prehensile, longer than the body, thick at the base and tapering to the end, which, for some inches on the under side, was bare. This little animal is called in Surinam *kissing-hand*, as the inhabitants pretend that it will never eat, at least when caught, but that it only licks its paws, in the same manner as the bear: that all trials to make it eat have proved in vain, and that it soon dies in confinement. When I got the first, I sent to the forest for a nest of ants, and, during the interim, I put into its cage some eggs, honey, milk, and meat; but it refused to touch any of them. At length the ant's nest arrived, but the animal did not pay the slightest attention to it either. By the shape of its fore-paws, which resemble nippers, and differ very much from those of all the other different species of ant-eaters, I thought that this little creature might perhaps live on the nymphæ of wasps, &c.: I therefore brought it a wasp's nest, and then it pulled out with its nippers the nymphæ from the nest, and began to eat them with the greatest eagerness, sitting in the posture of a squirrel. I showed this phenomenon to many of the inhabitants, who all assured me that it was the first time they had ever known that species of animal take any nourishment. The ants which I tried it with were the large white *termites*, upon which fowls are fed here.

As the natural history of this pretty little animal is not much known, I thought of trying if they would breed in a cage; but when I returned from my excursion into the country, I found them both dead, perhaps occasioned by the trouble given to procure the wasp's nests for them, though they are here very plentiful: wherefore I can give no further description of them, than that they slept all the day long curled together, and fastened by their prehensile tails to one of the perches of the cage. When touched they erected themselves on their hind-legs, and struck with the fore-paws at the object which disturbed them, like the hammer of a clock striking the bell, with both paws at the same time, and with a great deal of strength. They never attempted to run away, but were always ready for defence, when attacked. As soon as evening came, they awoke, and with the greatest activity walked on the wire of the cage, though they never jumped, nor did I ever hear their voice.'

This valuable account, the only one, as far as we are aware, ever drawn from actual and continued observation of the living animal, leaves us little to desire regarding the history and economy of this highly interesting species. The discovery of the true nature of its food is particularly valuable, and may enable us to have the animal brought alive to this country, a thing which, we believe, has not been attempted heretofore, and which, if attempted, has certainly never succeeded. To procure or carry ants during a long sea voyage is impracticable, but the larvæ of wasps can be obtained in any quantity, and will keep for months; so that the most serious difficulty to the introduction of the little ant-eater being thus removed, it only requires to be guarded from the effects of a colder climate, which may be as easily done in its case as in that of other South American mammalia. By the report of Azara also, it is probable that the tamandua lives upon the same food, and may consequently be introduced in the same manner.

ANTACIDS, from the Greek word, 'anti,' against, and the Latin word 'acidum,' an acid, signify means used to correct acidity in the stomach. Though hydrochloric acid (formerly called muriatic acid, or spirit of salt) is present in a free state in the stomach during the process of healthy digestion, yet under particular circumstances it is apt to be generated in excess. Other acids are also occasionally evolved in the stomach, probably from the fermentation of the articles, as vegetables and fruits of different kinds, by which the acetic acid is produced, or introduced ready formed, in wines, or hard beer; and in certain vegetables, as sorrel, which contains oxalic acid. The most frequent source of acidity, is that first mentioned, the secretion of

acid by the vessels of the stomach. It is, therefore, dependent upon constitutional causes, or the state of the system generally. This is further proved by considering what kind of persons are most subject to it. These are individuals either naturally of a feeble and weak constitution, or who have weakened the stomach and system generally, by excessive indulgence in *good living*, as it is termed, *i. e.*, too much animal food, and wine, unaccompanied by exercise and other counteracting measures. Hence we see these persons, or their children, and even their children's children, subject to gout or gravel, and stone in the bladder. As it has been ascertained (see the works of Mr. Murray Forbes, *A Treatise on Gravel and Gout*, 1786; Wilson Philip, Marcet, Blane, Prout, and Majendie) that these painful diseases have their origin in the tendency of the stomach to the formation of an excess of acid, an inquiry into the causes of this, and the circumstances under which it takes place, is of great importance, as a means of preventing or counteracting them.

When an excess of acid is introduced into the blood, it occasions much irritation of the system generally, and the composition of the blood being different from its natural constitution, the secretions formed from it are unhealthy, proving a further source of disease. In consequence of the composition of the blood being altered, matters usually held in solution by it can no longer be kept in that state, but are precipitated; hence we have *chalk stones*, as they are termed, formed around the joints in gout, and calculi, or *stones*, of different kinds, in the kidney or bladder.

The signs or symptoms of acid being in excess, are not in general limited to the stomach, but shew themselves in several parts of the body. There is heartburn (*cardialgia*), often followed by eructation, and rejection by the mouth of a fluid so extremely acid, as to cause effervescence when it falls on a marble stone; the bowels are sometimes confined, sometimes too loose; the urine generally scanty, and high-coloured, from which, on standing, a sediment falls down; the skin dry, harsh, and often affected with eruptions of different kinds; and the mind of the patient fretful, and much given to take gloomy views of his health or circumstances; in short, decidedly hypochondriacal.

The medicinal means of remedying this state are all alkaline, either the pure alkalies, or some combination of them—such as solution of potash, or carbonates of soda, potash, magnesia, ammonia, or lime. Where the bowels are not disordered, but the urine denotes that the excess of acid mostly finds an outlet by that channel, the preparations of potash and soda are to be preferred; where the bowels are much confined, magnesia, or its preparations, may be given in conjunction with rhubarb. Nothing is more hurtful than the frequent use of magnesia alone, it being apt to accumulate in the bowels: in the case of an individual much addicted to its use, a mass of it was found after death, lodged in the large intestines, which weighed six pounds. If, on the other hand, the bowels be in a loose state, prepared chalk may be given with advantage, or lime-water, which is a very useful addition to milk, where, from excess of acid, it disagrees, and hence most serviceable for weak children. Should the mind be much depressed, or general languor of the system exist, and no state of stomach be present forbidding its use, ammonia, in some form, may be exhibited.

Such are the medicines by which the effects of an excess of acid may be in some degree counteracted; but the most efficient means of preventing its formation, consist in a strict attention to diet and regimen. Great moderation must be observed in the quantity as well as quality of the food and drink. The plainest and most digestible animal food should be taken once, or, at the utmost, twice a day, and sparingly. Hard-boiled puddings and dumplings must be avoided. Toast and water, or soda-water, or well-fermented beer, or cyder, are preferable as drinks, to wine or ardent spirits, the only one of which last that can be allowed, is Hollands, and never but under particular circumstances, and with the sanction of a medical adviser.

Regular exercise, friction, and every means, such as flannel next the skin, which can keep up a free action of the skin, form a most important part of the prophylactic treatment.

ANTÆ. This is a term used by architects to designate the pier-formed ends of a wall, as in the terminations of the lateral walls in a Greek temple, where a plain face returns on each side, having some relation in general proportion to the columns with which they compose. The *antæ* (for the

word is used alike in the singular and in the plural) has a moulded and otherwise enriched cap or cornice, and generally a moulded base: in the simple Greek Doric style or order both the cap and the base-moulding are of few parts, and the enrichments are few, and are confined to the mouldings, which may be either carved or painted; but in the more ornate Ionian or voluted style, both the cap and base of the *antæ* are in proportion deeper, are in a great number of parts, and have extrinsic ornaments, besides the carving or painting of the mouldings of the cap, and the fluting or reeding of those of the base. The *antæ* of the foliated or Corinthian style will perhaps admit of still further enrichment, though the bold foliage and diagonal volutes of the capital of the column should never be placed on the square faces and sharp angles of the *antæ*. The moulded caps and bases of *antæ* are, in Greek works, generally continued along the flank walls so as to form the cornice and base of the whole wall, and not of the protruded faces of its ends alone. In Roman works and in modern imitations of both, breaks are often made on the face of a wall with the caps and bases of *antæ*, but more frequently with those of columns, and these are called pilasters, though indeed they are but an abuse of the Greek *para taia*, in the plural *parastates*, or *antæ*. In classical Greek, and in the best Roman works, *antæ* and pilasters are never either diminished or fluted. The term *antæ* is of barbarous origin, and it would be difficult to say whether it is derived from a Greek or Latin source: it may be from *antæ*, as used by Virgil in the second book of the *Georgics*, where he treats of vine-dressing.

ANTAGONIST MUSCLE, from *anti*, against, and *agon*, to strive,—a muscle the action of which is opposed to that of some other muscle. Muscles are the instruments by which, in the animal body, motion is effected. The object of each muscle is to produce some specific motion; among the various motions which are needed in the animal economy, it necessarily happens that some are directly opposite to others, and the muscles which accomplish these directly opposite movements are said to be with relation to each other *antagonists*. When any part of the body is placed between muscles which have an opposite or antagonizing action, the result of the combined action of such muscles is to keep that part steadily in a certain position. The form and position of the human mouth, for example, are maintained, such as they are, in a state of health and during repose of the features, by a number of muscles, composing the lips and cheeks, the action of some of which is directly contrary to that of others; the natural figure and position of the mouth may, therefore, be truly said to be the result of the combined action of a number of antagonizing muscles. The consequence of the disturbance of this antagonizing action is to change the natural form and position of the mouth. This is shown by the effect of paralysis when it affects one side of the face. Paralysis is a disease depriving the muscle of its power of acting. In paralysis of one side of the face, the muscles of that side are deprived of their power of acting; and the consequence is that the muscles of the other side, which retain their usual power, pull the mouth to their side, because they do not meet with the resistance which formerly opposed their effort to do this. Hence comes distortion of the mouth; and distortion is one of the most frequent and striking signs of apoplexy and paralysis, a sign dependent, it is obvious, on the loss of the antagonizing power of the muscles of that part of the body in which the distortion takes place. Sometimes the elasticity of a part is put in opposition to a muscle, and becomes the antagonizing power. The elasticity of the ribs, of the wind-pipe, of the arteries, may be so considered.

ANTALKALIES, from *anti*, against, and *alkali*, an alkali, are means of counteracting the presence of alkalies in the system. An alkaline condition of the system is not an unusual occurrence, and leads, when long continued or extreme, to very serious consequences. The worst of these is the formation of those calculi or stones in the bladder denominated *phosphates*. A tendency to this state exists in most weak individuals: hence most commonly in children, old persons, and females. It may also be brought on by any cause which occasions either temporary or general debility. The prevalence of the depressing passions, as fear, anxiety, or any other which keeps up a *nervous state* of the system, the frequent and continued use of mercury, of powerful purgatives in sickly frames, injuries of the back, or the previous existence of a very acid state of the system, will occasionally

give rise to an alkaline state of the system, which, when considerable, shows itself by great general debility, pale countenance, deranged state of the stomach and bowels, and excessive secretion of urine of a pale colour, which, on standing, makes a white deposit. To cure, and prevent the return of, such a state, the causes must, as far as possible, be removed. This is best done by diet, regimen, and appropriate medicines. The diet should be nourishing, mostly animal food, but taken in moderation; and where wine is used, light French or Rhenish should be preferred; hard water should be carefully avoided; saline purgatives, as Rochelle salts, or Seidlitz powders, and indeed all combinations of a vegetable acid with an alkaline base, such as the common saline draught, must be abstained from. The irritability of the system is best lessened by opium and tonic medicines. These last furnish an excellent vehicle for the administration of acids which are the most fitting medicines—either muriatic, nitric, or the citric acid, which is most grateful to children. The phosphate of iron is also a very useful medicine. Purgatives of an active kind should seldom be given: but where the stomach and bowels of children are much disordered, calomel and rhubarb taken frequently for some time are of much service, especially when the phosphate of iron is employed at the same time. Pure, invigorating air, and moderate exercise, are very beneficial, with relaxation from too great mental exertion, where this has preceded the disease.

ANTALO. [See **ABYSSINIA**, p. 51.]

ANTAR, an Arabian warrior, best known to Europeans as the hero of a romance, translated into English, in 1819, by Mr. Hamilton, oriental secretary to the British embassy at Constantinople. The hero is not a completely fabulous person: he was the son of an Arabian prince, by a negro slave. Born, therefore, to his mother's condition, and for a long time disowned as an Arab, and ill-treated by his father, he yet raised himself to high consideration by his extraordinary strength, courage, and poetical talent. He lived at the close of the fifth and beginning of the sixth century.

The romance of Antar is conjectured to have been put together in its present form, from the original legendary tales, about the time of the famous Caliph Harun al Rashid: and it is still one of the favourite sources from which the professional story-tellers of Egypt, Syria, and Arabia draw their materials. The hero is an eastern Roland, routing whole armies for the love of his mistress. This poem is curious, as presenting an early picture of the manners of the Bedouin Arabs: but there is too much sameness in it to render it, in its English form, very interesting to the reader. (*Introduction to the Translation of Antar.*) [See **ARABIAN LITERATURE**.]

ANTARCTIC CIRCLE. [See **ARCTIC CIRCLE**.]

ANTARCTIC OCEAN, a term properly applied to the ocean between the antarctic circle and the South Pole. The word is sometimes used to express generally the cold oceanic regions round the South Pole, without strict regard to the limits of the antarctic circle. Numerous attempts at discovery have been made in these high southern latitudes, [see **COOK**.] and particularly of late years. The farthest point yet attained is in $74^{\circ} 15'$ S. lat. 36° W. long, which was accomplished by Captain Weddell in 1823. The most recent discoveries of land in the Antarctic Ocean were made by Mr. John Biscoe in 1831 and 1832. On February 27, 1831, in $65^{\circ} 57'$ S. lat., $47^{\circ} 20'$ E. long. Captain Biscoe discovered land of considerable extent, closely bound with field ice, but was not able to approach it within twenty or thirty miles. At the time of the discovery the temperature of the air was 22° , and that of the water 30° : the Aurora Australis was very vivid. This unapproachable land was called Enderby's Land, from the name of the owners of the vessel. On February 21, 1832, Captain Biscoe landed on what is now called Graham's Land, which the discoverer supposes to be of considerable extent; the highest mountain in view, called Mount Wilhelm, was placed in $64^{\circ} 45'$ S. lat. $63^{\circ} 51'$ W. long. In front of this high continuous land is a range of small islands, now called Biscoe's Range. No living animals, except a few birds, were found on any of these islands, though there were many birds seen a few miles to the northward. For further information on the climate, &c., and the few pieces of land yet discovered in this part of the ocean, see the articles **NEW SOUTH SHETLANDS**, **SANDWICH LAND**, &c., and **POLAR SEAS**. For an account of Biscoe's voyage, see the *Journal of the London Geographical Society*, vol. iii., from which these facts are taken.

ANTARES, a name given to the bright star marked *a* in the constellation **SCORPIO**, which see. In the latitude of Greenwich, it has not more than 124° of altitude when on the meridian, where it is at midnight in the beginning of July.

ANTECE'DENT, a mathematical term used in proportion, meaning the *first* of the two terms of a ratio, in opposition to the *consequent*, or second term. Thus, in the continued proportion:—

$$2 : 4 :: 3 : 6 :: 4 : 8 :: 5 : 10, \&c.,$$

2, 3, 4, 5, &c., are antecedents; 4, 6, 8, 10, &c., are consequents. Antecedents may be made consequents, and consequents antecedents, without altering the truth of the proportion. Thus, if

$$a : b :: c : d,$$

it is equally true that

$$b : a :: d : c.$$

ANTECEDENTIA. When a heavenly body moves contrary to the order of the signs of the zodiac—from Gemini to Taurus, from Taurus to Aries, &c.—it is said to move *in antecedentia*. When it moves according to the order of the signs, it is said to move *in consequentia*.

ANTEFIXA, or **ANTEFIXÆ**, for this term is more frequently used in the plural, for both singular and plural, than otherwise. Antefixæ are blocks with vertical faces placed along over a cornice, in ancient Greek and Roman buildings, to hide the ends of the covering or joint tiles, and their faces are generally carved with a flower, leaf, or other enrichment, to make them ornamental. The flanks and rounded projection from the eastern end of the church of St. Pancras in London exhibit antefixæ ranged along over the cornice, but without the parts of which they are fitting accompaniments. The fronts of the Travellers' Club-House to Pall-Mall and Carlton-Gardens, also in London, show antefixæ more judiciously composed with the roof, with which they form an ornament to, and help to enrich, the elevation.

ANTELOPE, (*Antelope*, Pallas,) in zoology, a genus of ruminating mammals, belonging to the hollow-horned family, and distinguished by the round, annulated form of their horns, the grace and symmetry of their external proportions, the presence of suborbital sinuses and inguinal pores in the majority of the species, and other less general and important characters. The great extent of this genus, comprising, as it does, above three-fourths of the known hollow-horned ruminants, and the numerous additions which have been made to it since the period of its formation, render it utterly impossible to define it by such simple logical terms as shall at once distinguish it from conterminous genera, and embrace all the species which are usually associated with it. It is true, indeed, that most of the characters which zoologists commonly assign to the genus *antelope* are not found either in *bos*, *oris*, or *capra*, and in so far may be fairly considered as differential, and peculiar to the former genus: but unfortunately they are not in any instance common to all the individual species which compose this group, and consequently cannot be made the basis of a general definition. Hence it is that naturalists, in treating of the genus antelope, have been forced to content themselves with a general description of its most important characters and features, or even to define it by negative characters, such as the absence of a beard on the chin and a dewlap on the throat; and this mode of procedure, however unsatisfactory in general, appears to be unavoidable in the present instance, on account of the peculiar difficulties of the subject.

Perhaps the most general character belonging to the antelopes consists in the form of the horns being round and annulated, or at least never exhibiting the prominent angles and ridges which distinguish those of the sheep and goats. In their particular forms and curvatures, however, they vary in almost every different species, as among domestic sheep they do even in different varieties of the same species. Sometimes they form a single bend forwards or backwards, sometimes they are what is commonly called lyrate, or bend first backwards and then point forwards, in such a manner as, when opposed to one another, to assume the figure of an ancient lyre, the brachia or sides of which instrument were frequently made of the horns of the *dorcus* or common gazelle, as appears from the engravings of antique gems still preserved; sometimes they are twisted into a spiral form, and sometimes the horn itself is straight and surmounted by one or two turns of a prominent spiral wreath.

In many of the smaller species the bony core, or process of the os frontis which is inserted into the hollow sheath of the horn itself, is almost solid, or at least the osseous substance of it is penetrated only by very minute pores. M. Geoffroy St. Hilaire has proposed to make this character the distinctive mark of the genus, and his sentiments upon this subject have been adopted by M. Desmarest and most other subsequent writers, including Baron Cuvier himself; but it has been clearly shown by Colonel Hamilton Smith, that the character is by no means universal, nor even general, all the larger species having the core of the horn more or less cellular, and some as completely hollow as the ox, the sheep, or the goat. In other respects the character proposed by M. Geoffroy is so devoid of influence upon the habits and economy of the animals, and so unimportant even as an artificial distinction, that its practical failure is little to be regretted. A much more important, though unfortunately not a more general character, is found in the presence or absence of horns in the female sex. In this respect the antelopes are as variable as in all their other characters; in both sexes the greater number of them have horns, but at the same time the females of many species are deprived of these organs, and this character, though not universal to the whole genus, is invariably constant in the species which possess it.

The possession of *lacrimal sinuses*, or, as they are vernacularly called with reference to the stag and fallow-deer, *tear-pits*, is another circumstance which distinguishes the greater number of the antelopes, but which, like all their other characters, is far from being general. Many zoologists suppose these organs to communicate with the nostrils, so as to enable the animals to breathe freely during their long and rapid flights when pursued or frightened: some even suppose them to be subservient to the sense of smell, and to serve for detecting the noxious qualities of the numerous poisonous plants which grow in the deserts, or spring up among the rank vegetation of tropical climates. It is certainly true that all these animals possess a most delicate sense of smell, and that no known quadrupeds can surpass, and very few equal, them in the course. Mr. White, in his *Natural History of Selborne*, and Colonel Hamilton Smith in the fourth volume of Griffith's edition of the *Règne Animal*, even assure us that they have observed the air passing backwards and forwards through the suborbital sinuses of the fallow-deer and sambar (*Cervus hippelaphus*) whilst the animals drank with the nose completely plunged into the water: yet, notwithstanding the direct authority of these respectable writers, we are strongly inclined to believe that their observations rest upon some accessory circumstance which escaped their attention at the time, since it is very certain, as is demonstrated by the anatomy of the parts, that no internal communication exists between the lacrimal sinus and the nose, or indeed any other organ. The sinus itself is simply composed of a sack or fold of the skin, of greater or less extent according to the species, but always capable of being opened or shut at the will of the animal, and furnished at the bottom with a gland which secretes an oily, viscous substance of the colour and consistence of ear-wax, but which hardens and turns black upon exposure to the air. The precise functions of these organs are entirely unknown: that they serve some special purpose in the great economy of nature cannot be doubted for a moment by those who are in the least acquainted with the general principles of comparative anatomy, but the exact nature of their function can only be ascertained by those whom fortune has placed in a situation where they may have daily opportunities of observing a great many different species in their natural state and original habitat. All that we know with certainty at present is, that many of the antelopes which are most commonly brought to Europe and preserved in menageries, such as the common Indian antelope and the gazelle, make continual use of this organ when any strange substance is presented to their notice, particularly if it be odoriferous, and appear to derive great pleasure from protruding the lacrimal sinus and rubbing its interior surface against the odorous body. This, and similar observations render it by no means improbable that the organ in question may, in some manner or other, take cognizance of the qualities of matter, and thus be subservient to the intellectual faculties of the animal; out if so, it must be confessed that we are at present entirely ignorant of the precise mode in which it acts.

It has been already hinted that the antelopes are not the

only ruminants which possess suborbital sinuses: in fact, these organs are more universally found in the deer kind than in the present genus; but, on the other hand, as these are the only animals belonging to the hollow-horned family which exhibit this character, it thus becomes sufficiently appropriate, and, as far as it goes, serves readily to distinguish the antelopes from the goats and sheep, with which they are most liable to be confounded. In this respect, as well as in the absence of horns in the females of many species, they form an intermediate link between the rest of the hollow-horned ruminants and the cervine or solid-horned family: so nearly indeed do some species of antelopes approach to the deer kind in general, and so perfectly similar are they in all their most prominent and essential characters, the horns alone excepted, that it is often next to impossible to distinguish the hornless females of the one genus from those of the other. In these cases it is only by such trifling appearances as the form of the tail and ears and the quality of the hair, that we are enabled to form even a tolerable guess as to the genus of the individual; and even these criterions are frequently fallacious, a strong and convincing proof of the close affinity which subsists between these two genera, and of the propriety with which Professor Pallas, on the original formation of the genus *Antelope*, considered these animals as forming the connecting link between the deer and the goats, with the latter of which they had been up to his time associated.

Besides the suborbital sinus, a few species of antelopes possess a different gland, which runs lengthwise between it and the mouth, in a direction for the most part parallel to the plane of the chaffron or face and nose, and secretes a dark oily substance: it is, however, entirely external, and has no internal opening like the lacrimal sinus, nor are its uses better known than those of that organ. It is likewise much less general, being confined to a very small number of species; and, as appears from the observations of M. F. Cuvier and Colonel Smith, sometimes accompanies the lacrimal sinus, and at other times is found alone without any appearance of the latter. The former fact, if it can be relied upon, proves at least that it is a separate organ, and not a mere modification of the lacrimal sinus; and, consequently, it may be fairly presumed that its function, whatever it may be, is likewise different. Another character, but much more generally found to distinguish the antelopes than even the suborbital sinus itself, is derived from the inguinal pores, which are sacks or deep folds of the skin, situated in the groin, opening inwards, and secreting a glutinous substance similar to that of the glands already mentioned. Very few species, indeed, want these pores, but still they are not universal, nor can we form even a probable conjecture regarding their use. A single species, the chamois, (*A. rupicapra*), has a pit or fold of the skin nearly half an inch in depth, opening externally by a small aperture immediately behind each ear, but not provided with a gland, nor appearing to secrete any matter. Baron Cuvier supposes, with great probability, that it was this circumstance which gave origin to the opinion of the ancient Greeks and Romans, so often alluded to by Elian, Pliny, and other classical authors, that goats breathed through their ears, an opinion repeated by Gesner, Aldrovandus, and other writers of the middle age, and which finds a parallel among modern naturalists in the idea before referred to, that deer and antelopes breathe through their suborbital sinuses.

In the form of the upper lip, an important character among animals which seek their food on the ground, and in which the lips and tongue constitute the only organs of touch and prehension, the antelopes are as variable and inconstant as in the other characters already described. In some species it forms a broad naked muzzle, as in the ox; in others it is hairy and attenuated, like that of the goat; and finally, it sometimes assumes an intermediate form, and presents a modification of both these characters. The females are furnished with either two or four teats, forming a small udder; they usually bring forth but one at a birth, in a few instances two, and the period of gestation differs according to the species. Few observations, however, have been recorded upon this subject; the nyi-ghau, and some others of the larger species, are known to go with young about eight months, but it is probable that the smaller species do not go longer than the sheep and goat, or about five months. It is very seldom that the males and females in this genus, or indeed among mammalia in general, differ from one another

in colour, but when this does happen, as in the instances of the nyi-ghau and common Indian antelope, the young males always assume the female's colours for the first two or three years of their lives, and only gain the adult colours of their own sex as they advance in age.

The hair of the antelopes is generally short and smooth, and of an equal length over every part of the body; some, however, have manes along the neck and on the shoulders, composed of long bristly hair, either growing upright or reversed towards the head as in the oryx; and a very few species, like the gnu, are furnished with a beard on the chin and throat. The ears are commonly long, narrow, and pointed, smooth on the outside and filled internally with long white hair growing in five longitudinal lines, with four naked black spaces between, and forming the appearance which, in describing these animals, is usually denominated *striated*. The tails are generally short, round and tufted at the extremity, and many species are furnished with little tufts of long black hair, called *scapæ* or knee-brushes, upon the upper part of the anterior canons, immediately below the carpal joint.

Generally speaking, the antelopes are gregarious and unite in large herds, either permanently, or at particular seasons of the year, but only for the purpose of migrating in search of more abundant and grateful pasturage; some species, however, reside in pairs or small families, consisting of an old male and one or more females, with the young of the two foregoing seasons. They are always extremely cautious in guarding against surprise, placing sentinels in various directions about their feeding ground, to warn them of the approach of danger whilst grazing or reposing, and their vision and sense of smell are so acute, that it is only by using the greatest caution and circumspection that the hunter can bring them within range of the gun. The names by which the animals themselves are distinguished in all languages, ancient as well as modern, have a direct reference to this quickness of sight, and to the brilliancy of the large black eyes which form so conspicuous a feature in the antelopes. Thus the word *dorcæ*, (*δορκῆς*), the Greek and Roman name of the gazelle, or common Barbary antelope, is derived from the verb *δορκαω*, to see. The common English word antelope, which zoologists have adopted as the generic name of the group, is a corrupt form of the term *ἀνθροψ*, employed by Eustathius to designate an animal of this genus, and literally signifying *bright eyes*; and, according to the learned Bochart, *Tabitha*, the name of the disciple raised to life at Joppa, is derived from *tzebi*, the Hebrew name of the common gazelle, and alludes likewise to the beauty of her eyes. Among the Greeks and Romans also, as we learn from Agathias, and others, *dorcæ*, *dorealis*, and *damalis*, all names of different antelopes, were common names of women likewise, bestowed without doubt on account of the remarkable beauty of their eyes; and Prosper Alpinus, and more recent travellers, inform us, that 'Aïne el czazel,' *You have the eyes of an antelope*, is the greatest compliment which at the present day an oriental admirer can pay to his mistress. Eastern poetry and romance, as well as the works of the Greeks and Romans, abound with similes and metaphors taken from the form and habits of these animals; they are universally the images of gentleness and timidity, of grace and fleetness. The inspired writer beautifully compares the speed of Asahel to that of the wild gazelle; the Gadites also are said to have been as swift as mountain gazelles—for this is the proper signification of the Hebrew word *tzebi*, improperly translated *roe* in our English version of the Scriptures; and many other instances might be adduced, both from sacred and profane writers. Throughout all parts of the East the fleetness and timidity of the antelope tribe is still proverbial, and furnishes the Persian and Arab poets with images of gentleness, beauty, grace, and affection. The swiftest dogs and horses are left far behind in the pursuit of these animals, and it is only by stratagem that they can be hunted with success. For this purpose the hawk or the cheetah (*felis jubata*) is commonly employed in the East, and the gun or various descriptions of snares and traps by the inhabitants of South Africa. The hawk, by attacking the animal about the head and eyes, harasses it and impedes its flight, till the hunter has time to come up; and the cheetah, like the rest of the cat-kind, steals upon it unawares, and seizes it by a sudden spring before it has time for flight. If, however, the first spring misses in its aim, and the antelope escapes, there is no chance of taking it afterwards, and the cheetah, irritated by disap-

pointment, is soothed only with considerable difficulty, and becomes unfit for the chase for some days afterwards. The Bushmen of the Cape often destroy vast numbers of the antelopes with which their country abounds, by poisoning the springs and reservoirs to which they are known to resort, nor is the flesh ever known to be injured by this mode of slaughter; they also shoot them with poisoned arrows, but in this case the parts immediately around the wound must be cut out before the rest of the body imbibes the poison, which would otherwise penetrate through it, and render it unfit for food.

Africa may be considered as the head-quarters of the antelopes. Of this numerous genus, consisting at present of nearly seventy different species, upwards of fifty species inhabit the African continent alone, two or three are common to it and Asia, about a dozen species are peculiar to this latter continent, two inhabit Europe, and one only is found in the new world: the Rocky Mountain-goat, described by Colonel Smith under the name of *antelope lanigera*, belongs certainly to a different genus, and has no other character in common with the antelopes, except the round form and small size of its horns. Australia and Madagascar are as far as we at present know, completely destitute of antelopes, as indeed they appear to be of all indigenous ruminants. The precise nature of the habitat frequented by these animals has nothing of a uniform character, but, as might naturally be expected from the different modifications of organic structure observable throughout the genus, differs according to the particular species. Some frequent the dry sandy deserts, and feed upon the stunted acacias and bulbous plants which spring up even in the most arid situations, where the stony nature of the ground gives a certain degree of adherence to the soil; some prefer the open stony plains, the steppes of Central Asia and karroos of Southern Africa, where the grass, though parched, is still sufficient for their subsistence; some again inhabit the steep rocky mountains, and leap from cliff to cliff with the ease and security of a wild goat, whilst others are found only in the thick and almost impenetrable forests of tropical countries.

The great extent of the genus *antelope* has obliged zoologists to subdivide it into a number of minor groups, or, as they are sometimes called, subgenera; and some have even gone so far as to bestow different names upon each of these different subdivisions. So long, however, as these animals are simply considered as different species of a common genus, this latter practice is neither sanctioned by example in other instances, nor productive of so much practical utility as to justify an exception to the general rule in the present. We shall therefore be so far guided by the example of Baron Cuvier, as to dispense with the names imposed upon the different subgenera of the genus antelope, by Lichtenstein, De Blainville, and other writers; contenting ourselves, like the first-mentioned eminent zoologist, with designating the various subdivisions by appropriate numbers, which have all the advantage of perfectly distinguishing the different groups, without misleading the judgment by false associations, or directing it to mistaken affinities and relations which have no existence, the too common consequences of an inconsiderate application of vague and improper terms. The principles of division and arrangement which we shall adopt are those which appear best calculated to distinguish the different groups in a definite manner, and at the same time to place in contiguity those species which most nearly approximate to each other in their general characters and habits. M. Cuvier has, for this purpose, followed the example of Pennant and Erxleben by adopting simply the curvatures of the horns, and this method has indisputably the advantage of great clearness and simplicity; but it is, at the same time, purely arbitrary, and certainly does not arrange the different species of antelopes according to their natural affinities. The plan of MM. Lichtenstein, De Blainville, and Colonel Smith, is much superior in this respect, but is much more complicated, and their divisions are sometimes vague and indefinitely characterised. We shall endeavour to unite the advantages of both systems, by adopting those characters which are most constant and influential in each, and rejecting all those of a secondary or variable nature.

1. The first of these subgenera or subdivisions of the genus antelope, which has been denominated *antilopæ* by the French naturalists, and *diceranoceros* by Colonel Smith, comprises one or perhaps more species, remarkable

for being the only hollow-horned ruminants in which these organs are provided with a snag or branch in front, like the antlers of the stag or roebuck; a peculiarity of conformation which, as well as the general form and habits of the animals themselves, assimilates them in a great measure to the deer kind, and seems to point them out as the natural connecting link between the solid and hollow-horned families of ruminating animals. Their horns are of a moderate size, hollow only for a short distance from the base, and almost straight till within a few inches of the points, where they bend suddenly backwards and form a complete hook, like those of the chamois: from the root to this bend they are rough and scabrous like the antlers of deer, but the point is black, smooth, and shining, and the prong or antler, which in old animals is situated about half-way up from the root of the horn, is short and compressed, points forwards and a little outwards, and never exceeds an inch or an inch and a half in length. The females are without horns and have four teats, forming a small udder; the lips are hairy and attenuated like those of the goat; there are neither suborbital sinuses nor inguinal pores as in the generality of the antelopes, but the fore-knees are furnished with large and copious brushes, and an erect mane of long hair runs from behind the ears half-way down the neck. One of the most remarkable characters of this group, and, with a single exception, peculiar to it among horned ruminants, consists in the total deprivation of accessory or false hoofs, another affinity with the solid-horned family, which approximates it strongly to the giraffes, and forms an additional inducement to place it at the head of the genus antelope. These animals even seem in some manner to connect the otherwise anomalous genera of camels and llamas with the ordinary ruminants, at the same time that they connect the hollow-horned family with the solid-horned, by means of the double affinity which they bear on the one hand to the deer in the form of their horns, and to the giraffes on the other by the absence of accessory hoofs: the latter character being peculiarly confined, among ruminating animals, to the camels, the llamas, the giraffes, and the group of antelopes at present under consideration. Colonel Smith has described two species as belonging to this group, but we have the authority of Dr. Richardson, whose experience entitles his opinion to great weight, for considering the *antelope palmata* of that author, a species founded upon the inspection of a pair of horns in the Museum of the College of Surgeons, as nothing more than a very old specimen of the common species, *A. furcifer*. The same naturalist considers the present group (and though it consists of a single known species only, it is highly probable that the plains of Mexico and California contain one, if not two different species) to comprise the animals long since described by Hernandez under the generic name of Mazama; and it is at least certain that one of the species so denominated by the Spanish author very closely resembles the *A. furcifer*; but, on the other hand, we are expressly assured by Hernandez himself that the ancient Mexicans comprehended all the deer kind under this term, and the various descriptions which he gives afterwards clearly refer to solid-horned ruminants. The prong-horned antelope seems therefore to have been associated with the deer, on account of its branched horns; but whether the animal referred to by Hernandez be the same as that which is known to the west of the great lakes is a question to be determined by future observers. The only species of which we have any certain knowledge at present is—

I. The PRONGBUCK, (*A. furcifer*, Ham. Smith,) called *cabree* by the Canadian voyageurs, and the *goat* by the fur-traders. This animal measures four feet four inches from the nose to the root of the tail; its height is three feet at the shoulder, and the same at the croup; the ears are upwards of six inches long, and the tail about four and a-half. The horns rise perpendicularly from the skull, immediately above the orbits; they spread outwards, and are perfectly straight till within two or three inches of the points, where they curve suddenly backwards and inwards, forming a small hook, like those of the chamois. The prong is situated upon their anterior face, and in adult animals, about half-way up from the root; below it the horns are strongly compressed, rough and scabrous or pearly, like the antlers of deer; above it they are round, black, and polished. The prong itself is also very much compressed; it is little more than an inch in length, and points forwards, upwards, and a little outwards. The ears are long, narrow, and pointed; the tail short and bushy; the eye large and lively; the limbs long and

[The Prongbuck, *A. furcifer*]

slender; and the whole form and appearance of the animal peculiarly graceful and elegant. The head, ears, and legs are covered with short close hair of the common description, but that of the body is long and padded, and of a texture altogether different from that of other animals. It is tubular or hollow within like the feather of a bird, but so brittle and devoid of elasticity that it snaps with the smallest effort, and, when pressed between the finger and thumb, crushes like a reed and never regains its original form. It stands directly out at right angles to the hide, is about two inches long on the back, sides, and buttocks, but from the ears half-way down the neck it exceeds six inches in length, and forms an erect mane, equally conspicuous in both sexes. On the nape of the neck, shoulders, back, and hips, it is of a uniform fawn colour for half an inch at the point, and light-blue with a tinge of rose-colour at the root; on the sides, chest, and belly, the latter colour prevails at the root, and the point is of a pure and shining white. The extremities are uniform light fawn-colour throughout, except on the interior of the fore-arms and thighs, which are white. A broad disk of pure white also surrounds the tail, and passes over the croup, and the throat is likewise marked with two transverse bands of the same colour. This is the winter dress of the animal; but Dr. Richardson, who has well described it in his *Fauna Boreali-Americana*, informs us that in summer when the new coat appears, it has at first the ordinary texture and appearance of common hair, and that it only assumes the appearances here described on the approach of the cold season.

The prongbuck inhabits all the western parts of North America from the 53° of north latitude to the plains of Mexico and California, that is, presuming this species to be the Mazama of Hernandez: it is particularly numerous on the banks of the southern branch of the Saskatchewan, and on the upper plains of the Columbia river, and a small herd annually visits the neighbourhood of Carlton House, where a few individuals even linger throughout the winter. They are gregarious, frequent the open plains and hills of moderate height, never inhabit closely-wooded districts, and migrate from north to south according to the season. When the ground is clear, their speed surpasses that of most other animals, but a good horse easily outstrips them after a slight fall of snow; they are extremely curious, and the Indians, and, as we are informed by Dr. Goldman, even the wolves, know how to take advantage of their curiosity to get within reach of them, by crouching down, and moving forwards, or stopping alternately. The antelopes wheel round and round the object of their attention, decreasing their distance at every turn, till at last they approach sufficiently near to be shot or captured. This habit renders them an easy prey, but as their flesh is not much esteemed by the Indians, they are only hunted in times of scarcity. The females produce one, and occasionally two kids early in the month of June.

II. The second group of the genus antelope is equally without lachrymal sinuses, inguinal pores, or horns in the female sex, and has hairy lips like the group already de-

scribed; but the females have only two teats, the knees are destitute of brushes, and the horns are simple, and without the branch which so prominently characterises those of the prongbuck. This division likewise consists, at present, but of a single species, lately discovered by Mr. Hodgson, the British resident at the court of Katmandoo in Nepal, and described in the Proceedings of the Zoological Society. It is

2. The CHIRU, (*A. Hodgsonii*, Abel,) believed to be the unicorn of the Bhotias, and supposed by Colonel Smith to be the animal which Ælian describes under the name of *kemas*, (see also Homer. *Iliad*, x. 361.) an opinion founded upon very slight and not easily tenable grounds. The whole length of this animal, from the muzzle to the root of the tail, is about five feet, its height three feet; the tail is eight inches long; the head, from the nose to the root of the horns, nine; the ears four inches, and the horns, measured along the curves, upwards of two feet. These grow upright from the skull, are strongly compressed on the sides, bend slightly backwards at first, and afterwards point gradually forwards, thus assuming a lyrate form, but less strongly marked than in the common gazelle; they are surrounded, to within six inches of the points, with from fifteen to twenty annuli, forming prominent knobs in front, but more obscure on the sides and rear; the last six inches are smooth and round, and the points rather attenuated. The legs are long and slender, but the symmetry of the head is destroyed by two large fleshy tumours about half the size of a hen's egg, which grow close to the outer margins of the nostrils, as well as by a profusion of bristly hair which surrounds the mouth and nose. The body is furnished with two different kinds of hair, a long external coat of the usual quality, and a short interior one of fine close wool. The prevalent colour of the latter is uniform greyish-blue, and the outer coat is likewise of the same colour at the base, but it is tipped with reddish-fawn, and thus gives the whole of the upper parts a tawny hue, through which the lower tinge is but faintly visible. The belly and interior of the limbs are white, the nose and face black, and a dark brown band passes down the front of each leg.

The chiru, according to the information obtained by Mr. Hodgson, inhabits the elevated plains of Thibet, but never approaches the mountains, and is altogether unknown on the Indian side of the great Himalayan chain. It is gregarious, residing in herds of many hundreds on the open plains, extremely shy and difficult to approach, posting sentinels in all directions where the herd feeds or reposes, and flying with astonishing velocity on the first alarm or intimation of danger. When brought to bay, however, the males defend themselves with courage, and in confinement are sometimes mischievous, and should be always approached with a considerable degree of caution. Like most other ruminants, they are extremely fond of salt, and during the summer months unite in large herds to visit the beds of this mineral, which abound throughout Thibet, advancing under the guidance of an experienced leader, and as usual posting sentinels to prevent surprise.

III. The third group of antelopes, comprehending more particularly the animal to which the name is originally and properly assigned, is distinguished from the two former groups by the possession of large suborbital sinuses, and by round annulated horns, assuming more or less of a spiral form, but equally confined to the male sex. These animals have likewise large inguinal pores, and hairy, attenuated lips; the females are provided with two or four teats, and the knees of all the species, except one, are furnished with brushes of long stiff hair. They inhabit different parts of Asia and Africa, prefer the open stony plains and steppes, live in families consisting of an old male and a variable number of females, with the young of the two or three preceding seasons, and occasionally unite into flocks of many thousand individuals for the purpose of migration. The best-known species of this division, and indeed of the whole genus, is

3. The SASIN or COMMON ANTELOPE, (*A. cervicapra*, Pallas,) remarkable for the form and beauty of its horns, which compose a spiral of two or more turns, according to the age of the animal. This beautiful animal is, when full grown, about four feet in length, and two feet and a half high at the shoulder; the head, measured from the nose to the root of the horn, is seven inches long, the ears five and a half, and the tail, without the hair, six inches. The legs are long and delicate, the body round, but light; and well formed, the

[The Sasin, or Common Antelope, *A. cervicapra*.]

the ears long and cylindrical, the suborbital sinus particularly developed, and in continual motion, and the horns forming a complete spiral of two or three turns, wrinkled at the base, distinctly annulated in the middle, and smooth for a couple of inches next the points. The females, and young males for the first three years of their age, are of a uniform tawny-brown on all the upper parts of the body, with a light silvery band passing longitudinally from the shoulder to the hips, about six inches below the spine, on either side; the breast, belly, and interior of the fore-arms and thighs are white; as is likewise the under surface of the tail, which is rather broad, and furnished with a small tuft of black hairs at the extremity. After their third year, the males begin to assume the adult colours of their sex, and gradually darken on all the upper parts of the body, till they finally become almost entirely black above and white beneath, the nose, lips, and a large circle round each eye being likewise white, but the light bands of the sides completely obliterated. The hair is uniformly short and close over the whole head, body, and extremities, except on the knees, which are furnished with tufts of long bristles, forming small knee-brushes.

The sasins are so swift that it is useless to slip greyhounds after them, as, unless taken by surprise, which their extreme precaution seldom allows, it is impossible to overtake them, and experience has convinced the Indian sportsmen that the dogs are more likely to be injured in the chase than the game. The bounds also which these animals occasionally take, either for their own amusement or over the long grass when pursued, are said to be almost inconceivable. Captain Williamson, in his splendid work on the *Wild Sports of the East*, assures us that he has seen an old buck antelope lead a herd of females over a net at least eleven feet high, and that they frequently vault to the height of twelve or thirteen feet, and pass over ten or twelve yards at a single bound. They reside on the open plains of India, where they can see to a great distance in every direction, live in large families of from five or ten to fifty or sixty grown females to a single male, and when they feed, or lie down to ruminate, detach a number of the young bucks to a distance of two or three hundred yards on every side, to watch over the common safety. Nothing escapes the notice of these careful sentinels; every bush or tuft of grass that might be suspected to conceal an enemy is strictly and attentively examined, and on the first alarm the whole herd betakes itself to flight, following closely in the footsteps of the old buck, and is soon beyond the reach of pursuit. The venison is dry and unsavoury, and being held in small esteem, consequently holds out no inducement either to the occasional sportsman or to the professional Indian hunter. The species extends over every part of India, from the borders of Persia to the most eastern parts of which Europeans have any distinct knowledge. It is found on rocky, open plains, avoids woody localities and the thick cover of the forest, nor is there any certainty of its existing beyond the limits of India, though many zoologists, from Ray to Hamilton Smith, are of opinion that it likewise inhabits some parts of Africa. The fakirs and dervishes polish the horns and form them

into a kind of offensive arms by uniting them at the base; these they wear at their girdles instead of swords and daggers, which their vows and religious character prevent them from using.

4. The SAIGA (*A. colus*, H. Smith) is the only species of real antelope which inhabits any part of Europe; the chamois, though also considered as belonging to this genus, is really an intermediate species, partaking equally of the characters of the antelopes and the goats. The size of the saiga is about equal to that of the fallow deer, the length being four feet; but the form of the body more nearly resembles that of the sheep, being round and heavy, with a large head and short slender limbs, and the whole proportions of the animal want the usual grace and elegance which commonly characterise the antelope tribes. The nose is large, swollen, and cartilaginous, like that of the elk; it is marked above by deep transverse furrows or wrinkles, and, from its great size and protuberance, compels the animal to go backwards whilst feeding. The nostrils are large and open, the ears of a moderate size, the tail from three to four inches in length, and the lachrymal sinuses much smaller than in the Indian antelope. The hair is uniformly long and flowing over the whole body, of a greyish-yellow colour in summer, and greyish-white in winter on the upper parts, and white beneath at all seasons: the knees are furnished with small brushes. The horns of the male are longer than the head; they are semi-transparent and of a light yellow colour, which causes them to be much sought after by the Russians and Chinese for the purpose of making combs, lanterns, and other articles of domestic economy; their form is intermediate between that of the spiral-horned and lyrate groups, being distinctly twisted upon their axis, though without exhibiting the complete spiral threads which characterise the horns of the Indian antelope.

The saiga is mentioned by Strabo (book vii. p. 312. Casaub.) under the name of *colus* (κόλος); the Polish name of the animal, *sulak*, appears to bear some resemblance to the name in Strabo. The Tartars call it *akkak* and the Turks *akim*, which come so near to the Hebrew word *akko*, translated wild goat in our English version of the Scriptures, that we cannot help suspecting that the sacred writers alluded to this animal. In autumn the saigas unite into large flocks, composed sometimes of many thousand individuals, and migrate southward in search of a milder climate and more abundant pasturage; they return northward in small families about the commencement or middle of spring, and generally keep about the vicinity of lakes and rivers, as they drink a great deal, and, as we are credibly assured, by sucking the water through their large open nostrils. This last fact is also stated by Strabo. They like to feed upon acrid, saline, and aromatic plants, and grow very fat during the summer season, but their flesh acquires a disagreeable taste from the nature of their food, and must be allowed to cool after cooking before it is fit to be eaten. The females are gravid about six months, from the end of November to the end of May; they drop their kids soon after their return northward in the spring, and commonly produce one, rarely two, at a birth. They inhabit the open steppes and deserts from the Danube to the Irish eastwards, and as far north as 54° of latitude, and are found in Poland, Moldavia, about the Caucasus and the Caspian Sea, in Siberia, and in Northern Persia. Their eye-sight is said to be defective from the reflection of the dry arid plains upon which they mostly reside; and, though amazingly swift for a short distance, they are soon exhausted and easily run down. They are hunted principally for the sake of their horns and skins, the latter of which, particularly those of the kids, are much valued for the manufacture of gloves. The hunters must always take care to approach them against the wind, as their sense of smell is remarkably acute. With all these precautions it is often impossible to get within shot of these animals, as, like many other gregarious species of antelope, they take care, whilst feeding or reposing, to place sentinels in different directions round their encampment to warn them of the approach of danger. The females, according to the traveller Gmelin, have four teats, but it is not always safe to rely upon the observations of this writer.

5. The DZEREN (*A. gutturosa*, Pallas), the hoang yang, whang yang, or yellow goat of the Chinese, is about the same size as the species last described, being nearly four feet and a half in length, and two feet six inches high at the shoulder; the body also is large and corpulent, and the legs

shorter than is common to the antelopes in general; the horns are black, lyrate and marked to within a short distance of their points with prominent transverse rings; the suborbital sinuses are small; the larynx large and salient, forming, particularly in the old bucks, a prominent lump on the throat; upon the prepuce of the same sex there is likewise situated a bag about the size of a hen's egg, which contains a waxy substance similar to that produced in the analogous organ of the musk animal, but without any kind of odour; the tail is short, and the knees furnished with small bunches of hair, but scarcely sufficiently long and distinct to merit the name of brushes; the summer coat is of a greyish fawn-colour above, and white beneath; that of winter almost entirely white, being tinged but slightly with a greyish-yellow shade on the back and sides. The females resemble the males in colour, but are rather of smaller size, and without horns; they want the sack on the abdomen and have two teats.

The dzerens inhabit the dry arid deserts of Central Asia, Thibet, China, and southern Siberia; particularly the great desert of Gobi, and prefer the most sandy and stony plains, feeding upon such scanty herbage as these localities supply, and avoiding water, to which they appear to entertain a marked aversion. They are remarkably swift, take prodigious leaps, and, when frightened, will occasionally pass over twenty or twenty-five feet at a single bound. In spring and summer they form small families which live apart from one another, but, in the beginning of winter, unite into large flocks, always under the guidance of an experienced old buck. They never run, even when pursued, in a confused crowd, but form single files, and follow closely in the footsteps of their leader; they rarely emit any voice; when taken are easily tamed, and indeed appear to have rather a predilection for the domestic state, often mixing with flocks of sheep, and approaching human habitations during the severity of the winter season: their flesh is tender and well tasted, and they form a favourite object of chase with the Moguls and Tartars. The gestation of the females continues from December till the middle of June, and they produce but a single kid at a birth, which grows slowly, and is long in arriving at maturity. During the first year the young males have neither horns nor any appearance of the protuberance on the throat from which the specific name of *gutturosa* is derived; but these organs are gradually more and more developed in proportion as the animal advances in age, till at last, in very old animals, the laryngeal protuberance attains the dimensions of five inches in length by three in breadth, and assumes the appearance of a large and deformed goitre. The females differ from the males by the absence of this protuberance as well as by the want of horns. Gmelin denies the antipathy to water which Messerschmid attributes to this species, and affirms that, when pursued, the dzerens do not hesitate to throw themselves into the first river they meet with, and that they swim remarkably well. The physical nature of the arid sandy plains which they frequent, in preference to all other situations, may probably have given rise to this presumed antipathy to an element which they seldom encounter, as well as to the marked antipathy to woody localities likewise attributed to them, trees and rivers being equally unknown in the indigenous habitats of these animals.

6. The PALLAH (*A. melampus*, Lichtenstein) is a magnificent species of South Africa, discovered by Professor Lichtenstein during his travels in Caffria, and since found in the Booshuana country on the elevated plains of Latakoo, by Trutell, Somerville, and Burchell. It is upwards of four feet and a half in length from the nose to the origin of the tail, and three feet high at the shoulder; the horns have an irregular lyrate tendency, bending first forwards and very much outwards, then with a large circular sweep inwards, and finally pointing forward again, approaching within three inches of one another at the tips, after being nearly a foot distant in the middle: they are about twenty inches long in adult animals, and surrounded for two-thirds of their length with irregular rings, often splitting into two, and forming prominent knobs on the front of the horn, but frequently obliterated, and always less strongly marked on the sides, which are slightly compressed. In the beautiful drawing of this animal given in Daniel's *African Scenery*, the horns are represented with an unnatural angular bend, which has misled many describers, and caused even Colonel Smith to describe them as forming an obtuse angular bend, though he has himself given an accurate drawing of the

[The Palla, *A. melampus*.]

pair which we have here described, and which certainly exhibit no appearance of the sudden angle attributed to them, which probably arose from the particular position in which Mr. Daniel's figure was drawn. The horns for a third of their length towards the points are black, smooth, and polished. The head, back, flanks, and outer surface of the legs and tail are of a deep rufous colour: the lips, eyebrows, interior of the ears, breast, belly, interior of the thighs and arms, and the region below the tail, white; the back is marked longitudinally by a band of deep shining black, which divides on the croup and passes down along each hip in the form of a crescent, separating the pure white of the buttocks and interior of the thighs from the general rufous colour of the upper parts; the outside of the knee and heel are likewise marked by brilliant black spots, which contrast strongly with the general rust-colour of the extremities, and from which the animal derives its specific name of *melampus*. The ears are very long, particularly in the females, which are without horns, and of a smaller size than the males, but similar in other respects; the ears are covered on the outside with short red hair, bordered and tipped with black, and the knees are without brushes. We are as yet very imperfectly acquainted with the characters of this magnificent species of antelope, so that it is not without considerable doubt, and only on the authority of Colonel Smith, that we venture to include it in the present group.

The palla inhabits Caffaria and the country of the Bachapins or Booshuanas, never descending farther south than the Koosges valley in the one direction, and the Kamhanni mountains in the other. They reside on the open plains in families of six or eight individuals, run with amazing swiftness, and occasionally leap like the springbuck, which, according to Mr. Burchell, they much resemble in their general habits and manners. They are extremely numerous on the elevated plains in the neighbourhood of Latakoo, and constitute a favourite object of the chase with the natives, as their flesh, though deficient in fat, is well-tasted and wholesome. *Palla* or *phaula* is the Bachap. name of the animal, but the mixed Hottentots, who travel into that country from the Cape, distinguish it by the Dutch term *roodebok* or redbuck, on account of the prevailing colour of its hair.

IV. The fourth subdivision or group of antelopes contains a single species, which differs from the last group principally by its small size, short straight horns, knees without brushes, and in the females being provided with four teats. The upper lip is hairy and attenuated; the lachrymal sinuses open externally by small circular apertures, about half an inch from the inner canthus of the eye, and there are no inguinal pores.

7. The MADOQUA, (*A. Salliana*, Blainville.) This is perhaps the smallest of all horned animals, being scarcely the size of a good English hare. It measures two feet in length from the nose to the root of the tail, and about four inches in height at the shoulder, the height at the croup being about an inch more. The length of the head from

the nose to the ear is five inches, that of the horns three; the ears are two inches and three-quarters long, and the tail an inch and a half. The horns of the male are situated in the plane of the forehead: they are very sharp-pointed, almost insensibly bent outwards and forwards, provided on the inner anterior margin with a prominent sharp ridge, which runs from the base to within a quarter of an inch of the points, and annulated for about two thirds of their length from the roots. The females are without horns, but have, in common with the males, a tuft of long stiff hair standing upright from the crown of the head, and forming a small crest, particularly remarkable in the females, from their not being furnished with horns; the hair on all other parts of the body is short, close, and smooth, except on the hind face of the hips and thighs, where it is rather longer, and radiates outwards and round the tail, its pure white colour contrasting agreeably with the colours of the croup and thighs; the face, forehead, and legs, as well as the tuft of long hair between the horns, are of a bright and deep red, as are likewise the backs of the ears; the neck, shoulders, flanks, rump, and outsides of the thighs, are of a clear grey colour, like that of the American grey squirrels, each hair being annulated with alternate rings of black and white; the back, from the shoulders to the rump, is a deep reddish brown, and the breast, belly, interior of the fore arms and thighs, and hinder surface of the hips, of the most pure unmixed white, forming altogether a variety, clearness and brilliancy of colouring rarely met with among quadrupeds; the tail is very short, being in fact little more than a mere stump; the ears are round and nearly the length of the horns; the hoofs small, well-formed, and, like the horns, of a deep black colour; the forehead is perfectly flat, and the head is compressed suddenly below the eyes, and tapers to a small and attenuated snout; the legs are long in proportion to the weight of the body, and so small that they scarcely equal the little finger in thickness.

[The Madoqua, *A. Salliana*.]

The madoqua is found in all parts of Abyssinia, where it was originally noticed by Bruce, who discovered it in the country about the sources of the Abawi or eastern branch of the Nile. Mr. Salt afterwards procured specimens in the mountains of Tigre, and sent the horns and legs to the British Museum, where they were observed by De Blainville, and described under the specific name of *Antelope Salliana*, in compliment to the distinguished traveller who procured them. More recently complete specimens have been brought to Europe by Rüppel, and Hemprich and Ehrenberg, and the species has been well described and beautifully figured both by these travellers and in the *Darstellung neuer Oder wenig bekannter Säugethiere* of Professor Lichtenstein. Little is known regarding the habits of this species. It is said to live in pairs in mountainous districts; and Pearce informs us that many of the Abyssinians object to eat its flesh, from a superstitious belief of its being often found in the society of monkeys and baboons.

V. The fifth group comprises two species at present very imperfectly known, and introduced into the present article on the authority of Colonel Hamilton Smith, the only na-

turalist who has hitherto observed and described them. They are distinguished by moderately-sized lyrated horns, confluent, as in the groups already described, to the male sex; by large suborbital or lachrymary sinuses, by brushes on the knees, two teats in the females, and probably inguinal pores; but the form of their upper lip differs from that of all those which we have described, and, instead of being hairy and attenuated as in the goat, terminates in a round naked muzzle, like that of the stag or roebuck, thereby indicating a decided difference in the habits and mode of life of these animals, more especially as regards the nature of their food. But for this circumstance, and the absence of horns in the female sex, another character which has a powerful influence upon the economy of ruminating mammals, the presence of the lachrymal sinuses, the number of teats, the existence of knee-brushes, and, above all, the lyrated form of the horns, would approximate the species at present under consideration to the group which includes the common gazelle, the springbuck, and other kindred species; but the characters attributed to them by Colonel Smith not only indicate a difference of food, but likewise a decidedly different habitat—the thick forest and the grassy meadow, instead of the barren stony hills and the parched and burning desert. All the details concerning their habits, as well as their local names, are however unknown, and it is only from their zoological characters that we are enabled to deduce a few facts regarding their economy.

8. *A. faggar*, H. Smith, supposed by its describer to be the species noticed by Pennant under the name of the Gambian antelope, and which that author identifies with the kob of Buffon, is said to be rather larger than the springbuck, the height at the shoulder being rather better than two feet, and the outward form and appearance similar to those of the kudu. The horns are about a foot long, black, and annulated for the first two-thirds of their length, smooth and pointed on the remaining portion; they stand close together at the base, bend slightly forwards at first, and then, with a wide sweep outwards, finally pointing inwards and forwards, and resembling in front the figure of a pair of forceps. The head is broad across the orbits, and measures about ten inches in length; the eyes large and black; the ears rather wide, open, slightly pointed, and filled internally with a bunch of long white hair; all the upper parts of the body are fulvous brown, darkest on the face and hips, all the under parts white, the latter colour being separated from the former by an indistinct dark stripe on the flanks; the legs are marked in front with a brown streak terminating in a black spot on the fore pasterns, and on the hind-legs extending but a short distance up the canon bones; small dark brushes protect the knees; and the tail, about six inches in length, is white beneath, light brown above, with a dark line down the middle and a black tuft at the extremity. The only specimen observed was brought from the west coast of Africa, and formerly exhibited at Exeter Change; it was remarkably timid, and of a mild, engaging disposition.

9. *A. adenota*, H. Smith, which this author identifies with the kob of Buffon, but certainly without sufficient grounds, since the kob has no lachrymal sinuses, whilst in the present animal they are, by Colonel Smith's own description, particularly long and open, is a species described from a pair, male and female, formerly in the Exeter Change collection, and distinguished by the peculiar manner in which the hair is directed upon the body, whirling round a small centre on the loins, and reversed or couched forwards on the back, upwards on each side of the neck, obliquely upon the flanks, and downwards on the hips. The general colour is a uniform fulvous bay above and white below, with a dark list down the front of the fore-legs, and a black ring round the hind canons immediately above the spurious hoofs. The tail is short and entirely covered with long black hair, and the lips, chin, and a space round the eyes are marked with white. The horns of the male rise immediately above the orbits, and are about nine inches in length; the first two-thirds are marked with ten rings, forming prominent knobs in front, but almost obliterated on the sides and behind; the superior third is smooth, black, and rather bluntly pointed; they are a little striated between the annuli and rather compressed on the sides; their direction is at first nearly in the plane of the forehead, but they afterwards spread outwards and backwards, with the points finally bending almost imperceptibly forwards, so as to assume, when seen in front, the figure of a common pitchfork. The

female is without horns, but in every other respect perfectly resembles the male. The pair observed by Colonel Smith were brought from the west coast of Africa, and were excessively shy and timid.

VI. The sixth subdivision of the antelope genus is distinguished by a round naked muzzle, large lachrymal sinuses, and horns confined to the male, but particularly by the number of the horns, which amounts to four, forming the only instance in which horned animals in a state of nature possess more than two of these organs. The inguinal pores and number of teats in the females have not been observed; the knees are without brushes. The group contains at present but a single authentic species, the two described by Dr. Leach and Colonel Smith being but different ages, or at most different varieties of the same animal.

10. The CHICKARA, (*A. quadricornis*, Blainville,) well-described by General Hardwicke in the *Linnean Transactions*, is about two feet nine inches in length from the muzzle to the root of the tail; the tail itself is five inches long, and the height at the shoulder about one foot eight or nine inches. The superior or common horns are about three inches long, smooth, black, pointed, erect, and moderately divergent, bending very slightly forwards, and without the least indication of annuli. The spurious or additional pair of horns are placed in front of these, immediately between the orbits, and consist of short, erect, blunt stumps, about three-quarters of an inch in length, an inch and a half in circumference at the base, and of the same smooth and black appearance as the real horns. The head is seven inches and a half long, the ears four inches and three-quarters, erect and pointed; the general colour of the upper parts is uniform bright bay, and that of the under parts silvery white, more or less mixed with sandy-coloured hairs; the lips are bordered with black. The females differ from the males by the absence of horns, and likewise by being of a lighter colour, which character is conspicuous at a very early age and continues throughout life.

This species, called chikara by the Hindoos, and chouka by the Nepalese, is common in all the wooded parts of India, particularly in Bengal, Bahar and Orissa; it is monogamous, and lives in pairs in the forests and thick jungle, being exceedingly wild and active, and rarely suffering a state of confinement unless taken young. During the rutting season the male becomes particularly mischievous, and it is then dangerous to approach him, as he butts at everything within his reach: the female produces two young at a birth, but the period of gestation has not been recorded. Baron Cuvier supposes, and apparently with reason, that the antients were acquainted with this species, and that the *Four-horned Oryx* of Ælian refers to the modern chickara.

VII. The seventh group includes a number of species which differ from the last, principally in the number of the horns, being two only, short, round, smooth, and slightly bent forwards. As in all the species hitherto described, they are wanting in the females. The head is terminated by a distinct, well-formed, naked muzzle, the lachrymal sinuses are large and conspicuous: one species only is without inguinal pores; another differs from the general type in the possession of knee-brushes, which are commonly wanting, and the females are universally provided with four teats, forming a small udder. A single species inhabits India; all the others are African, and reside on the open rocky plains, or in the gorges of mountain glens, sometimes bounding from cliff to cliff with all the ease and security of the ibex. These animals are generally monogamous, and associate in pairs or small families, but never unite into large herds like the saiga and springbuck, nor do they migrate from place to place like these species.

11. The NYLGITAU, (*A. picta*, Pallas,) one of the largest and most magnificent antelopes known, being upwards of four feet high at the shoulder, inhabits various parts of India, whence it has often been brought to England, where it lives and breeds, and is not an uncommon animal. The face of this species is long and narrow, the muzzle large and naked, the horns about seven inches long, small, round, and black, rather distant at the base, nearly parallel throughout their whole length, pointed and slightly curved forwards. They are perfectly smooth and without annuli, but rather triangular at the base, and gradually rounded and attenuated towards the points. The lachrymal sinuses are large, the ears seven inches in length, broad and rounded like those of an ox, the neck deep and compressed like that of the horse,

[The Nyl-Ghau, *A. picta*.]

not round and cylindrical as in the stag and most other antelopes, and the tail broad, equally covered with hair on the sides and at the root, but terminated by a long black tuft, and descending to the houghs. The legs are small and well-formed, the anterior rather longer than the posterior, and the spinous processes of the dorsal vertebrae so much elevated between the shoulders as to give the animal the appearance of having a small hump. When at rest, the feet are gathered close under the body, and the tail turned in between the hind legs. The hair is uniformly short and close upon every part of the head, body, and limbs, excepting along the top of the neck and on the shoulders, where it is long, stiff, and upright, forming a thin erect mane which extends from between the ears half way down the back; and on the middle of the throat, where there is a species of beard composed of stiff bristly hair. The general colour is a uniform slaty blue on the upper parts in the male, and tawny red in the female, on the under parts uniform white in both sexes; the limbs and face are almost brown, and the lips, chin, and under surface of the tail white. There is a large white spot on the throat, and two smaller ones on the cheeks under the lachrymal sinuses; and the pastern joints are marked in front with one, and in rear with two conspicuous spots of the same colour, which contrast strongly with the dark brown of the surrounding parts, and have suggested the specific name of *Antelope picta* which has been given to this animal.

The nyl-ghau resides in the dense forests of India, whence it occasionally makes excursions very early in the morning or during the night, to feed upon the corn-fields of the natives which happen to be situated in the vicinity of the jungle. It is a vicious animal, of very uncertain temper, and as it is both powerful and resolute, and frequently turns upon its pursuers, it is seldom made an object of chase except by the native princes, who employ elephants for this purpose, or enclose the game in nets. The usual method which the shecarries or professional hunters employ for its capture, is to shoot it from an elevated platform when it comes out at night or early in the morning to feed on the confines of the jungle; this being likewise their mode of destroying tigers, wild boars, and other beasts which they dare not attack openly. Even in confinement, and when domesticated from birth, the violent and changeable temper of the nyl-ghau cannot be trusted. Previous to making its attack, it drops upon the fore-knees, advancing in this position till within a proper distance, and then darting suddenly forwards with the velocity of an arrow, and with a force which no ordinary animal can withstand. Yet, notwithstanding its vigour and resolution, it is the most common prey of the tiger, which the shecarries often destroy in the very act of devouring the mangled remains of this animal; for, when these are discovered, the hunters always erect their platforms in a convenient situation in the neighbourhood of the carcass, knowing, by experience, that the tiger is sure to return on the following night to glut himself at leisure with the produce of his previous chase. The nyl-ghau has often bred

in confinement, both in this country and in India; the period of gestation lasts for eight months, and two young are most commonly produced at a birth. At first the young males are of the same reddish-brown colour as the females, and only assume the greyish-blue shade proper to their sex, on arriving at maturity: their growth is, however, rapid, and they attain their adult size in the second or third year of their age.

12. The Ourebi, (*A. scoparia*, Schreber,) called *bleek-bok*, or *palebuck* by the Dutch colonists at the Cape, according to Professor Lichtenstein, is a much smaller species than the nyl-ghau, and differs from all the other species of the present section by the large brushes which, in common with many other antelopes, it has upon the upper end of the canons, immediately below the knees, and from which it derives its specific name of *A. scoparia*. It measures three feet eight inches in length from the muzzle to the root of the tail; the length of the latter is three inches and a half, that of the head seven inches and a half from the muzzle to the root of the horn, of the horns themselves five inches and a quarter, and of the ears three inches and three-quarters. The height at the shoulder is one foot ten inches, at the croup nearly two feet, and the size of the animal, as well as its general form and proportions, are nearly those of the roebuck, only that the head is longer and more slender. The horns are awl-shaped, sharp, slender, nearly straight and bending almost imperceptibly to the front; they are surrounded at the base with a few obscure wrinkles, succeeded by five or six well-defined rings, but are smooth and black throughout the greater part of their length, and end in very sharp points. The general colour of the upper parts is a uniformly pale yellowish-brown, darker in some individuals than in others: all the under parts, as well as the chin, lips, and a longitudinal streak over the eyes in the form of eyebrows, are white, and this colour likewise spreads over the posterior surface of the hips. The tail is covered with long bushy hair of a jet black colour, forming a marked and prominent contrast with the white of the buttocks; the ears are edged with a narrow border of dark brown, and immediately beneath their opening at the root there is a remarkable bald or naked spot of an oval form on each side of the head.

The ourebi inhabits the open plains of South Africa, and without being positively gregarious, is fond of the society of its own species. It is found chiefly in the eastern districts of the Cape colony towards Caffraria, and its flesh, though dry and destitute of fat, is esteemed one of the best venisons of the country. Great numbers of these animals are found on the plains about Zwartkops bay. When feeding, they straggle confusedly over the plain, and appear to be in company rather accidentally than by intention; when alarmed also, they do not fly together, but each runs off by itself in whatever direction it thinks most secure from danger for the moment. If the *antelope montana* of Rüppel, generally identified with this animal, be in reality the same species, it would appear to extend along all the eastern coast of Africa, from the southern confines of the continent to the banks of the Bahr el Abiad, or White Nile, close to which Rüppel procured his specimens.

13. The Stæknok (*A. tragulus*, Lichtenstein) is one of the most graceful and elegant of the antelope tribe. Its legs are longer and smaller in proportion to its bulk than in any other species; its body is compact and well made; its head small, pointed, and ending in a well-formed naked muzzle, and its tail reduced to a mere tubercle, scarcely perceptible among the long hair of the croup and buttocks. The whole length, from the muzzle to the root of the tail, is about three feet four or five inches; that of the head, from the muzzle to the base of the horns, four inches, and from the same point to the root of the ear six inches, the tail being an inch and a half long, and the horns four inches. The height at the shoulder is one foot seven inches, and at the croup one foot nine. The colouring of this species is altogether peculiar, and alone sufficient to distinguish it from all other ruminants. In general, it is a reddish fawn-colour on the upper parts of the body, but this seems to be glazed, or, as it were, overlaid on the shoulders, back, sides, and hips with a light dun or silvery brown hue, arising from the hairs in these situations being tipped with that colour; the nose and legs are dark brown, the breast, belly, and interior of the fore-arms and thighs white; the hair of the forehead is long and of a deep red colour, and a remarkable black line passes from the root of each horn backwards, uniting

between the ears, and forming an obtuse angle equally as conspicuous in the hornless females as in the horned males, and affording an excellent criterion by which to distinguish the species. The horns of the male are small and round, furnished at the roots with a few faintly marked wrinkles, but smooth and polished throughout the greater part of their length, and ending in extremely sharp points, almost imperceptibly bending forwards. The ears are extremely large for the size of the animal, being nearly half as long again as the horns, and broad in proportion. But perhaps the most remarkable character of the species, and certainly that which most definitely distinguishes it from all the other ruminants with which it is at all likely to be confounded, though it has hitherto escaped the notice of observers, is the total absence of spurious hoofs, both on the fore and hind feet, a character which we have already found in the prongbuck, and which, as far as we are aware, no other ruminating animal of the hollow-horned family possesses.

The steenbok resides in pairs on the stony plains and mountain valleys of South Africa, not, however, frequenting very elevated or rocky localities, as its colonial name of steenbok, or stonebuck, would seem to imply. On the contrary, it prefers the dry open flats, covered here and there, it is true, with large rocks and boulder stones, but likewise interspersed with clumps of stunted bushes and underwood, which furnish it with cover. This is the general character of the South African plains in the neighbourhood of Cape Town, as well as of the gorges of the moderate hills and mountains, and it is in such situations that the steenbok is most commonly found. This animal is, moreover, remarkably shy and timid, runs with extraordinary swiftness, and when pursued will frequently bound over a space of twelve or fifteen feet at a single leap. When closely pressed, and without any further means or power of escape, it will hide its head in the first hole or corner it happens to meet with, and thus patiently resign itself to its fate. Though it cannot be called a rare animal at the Cape, it is nowhere particularly common, being much hunted on account of the delicacy of its flesh, which furnishes excellent venison, and great numbers of the young being destroyed by eagles and other birds of prey. Colonel Smith has described the young of the steenbok as a different species, by the name of *A. rufescens*; and the *A. pallida*, or *A. pediotragus*, of Afzelius, appears to differ in no respect from the adult of the present animal, the really distinctive characters of which have been hitherto very imperfectly reported.

14. The GRYSBOK (*A. melanotis*, Lichtenstein) is a species closely allied to the steenbok, but rather lower on the legs and more heavily made. The whole length of the body is nearly three feet, that of the head, from the muzzle to between the ears, six inches; the height at the shoulder is one foot five inches and a half, and at the croup one foot seven and a quarter; the horns are two inches and a half long, and the ears five inches. The head, as in the steenbok, contracts suddenly before the eyes, and ends in a pointed muzzle; the horns are situated immediately above the orbits, straight, upright, pointed, and shining, with two or three small annuli at the roots; the ears are long, wide, and open, and the tail, almost tuberculous, is concealed among the long hair which passes backwards over the hips. The hair of the body is universally long, particularly on the hind quarters; on the head and extremities it is, on the contrary, remarkably short. All the upper parts are of a deep crimson red colour, thinly but regularly intermixed with long coarse hairs of the purest white, giving the whole animal a hoary appearance, expressed by its colonial name of grysbok, or grey-buck, and forming altogether a character not easily mistaken; the inferior parts are uniform light sandy brown or red, the head and extremities fawn-colour; the muzzle, the openings of the lachrymal sinuses, and an obscure circle about the eyes, as well as a mark upon the occiput of some specimens are black, as are likewise the backs of the ears, which are nearly naked, with a few very short grey hairs thinly scattered over them.

The habits of the grysbok are in most respects similar to those of the steenbok. It lives in pairs upon the plains, never unites into troops or flocks, and conceals itself in clumps of underwood, whence it is not easily driven, lying close like a hare in her form, and seldom moving till almost trodden on. It is common in most parts of the colony at the Cape, and being less swift than the steenbok is more easily captured; its venison is much esteemed, though, like the generality of antelopes, destitute of fat.

15. The KLIPSPRINGER, (*A. oreotragus*, Forster,) called kainsi by the Hottentots, is an antelope which inhabits the most barren and inaccessible mountains of the Cape, and appears to supply in South Africa the place of the chamois and ibex. The entire length of this animal, from the muzzle to the root of the tail, is three feet two inches, its height twenty-one inches at the shoulder, and about an inch more at the croup; the horns are three inches and a half long, the ears four and a quarter, and the tail three. The head is short and small, compressed on the sides, and suddenly contracted immediately in front of the orbits, ending in a small, round, naked, black muzzle: the lachrymal sinuses open by a moderately-sized circular aperture; the horns of the male are perfectly straight and smooth throughout the greater part of their length, having three or four small but distinct annuli surrounding their roots; the ears are large, open, and rounded at the points; the eyes large and dark, and the tail appearing externally only by a brush of hair which clothes it. There are neither inguinal pores nor knee-brushes, but in place of the latter the knees of some specimens exhibit a naked callous patch, probably occasioned by rubbing against the rocks. The general colour of the animal on all the upper parts of the body is a lively and pleasing mixture of yellow and green, resulting from each hair being individually surrounded by alternate rings of these two colours; the under parts of the body are light sandy-red, tinged with yellow; the interior of the ears is filled with long white hair, a narrow black border surrounds their edges, and the eyes are encircled by the same colour. The hair of the body is long, padded, and stands perpendicularly out from the hide; that of the head and extremities is shorter, and lies in the usual direction; in quality the latter also resembles the hair of common animals, but the texture of the hair which covers all the upper surface of the body and neck is altogether peculiar, being similar to that of the prongbuck already described. It is round and hollow internally, and so fragile that it breaks with the slightest touch, crushing like straw when pressed between the fingers, and so deficient in elasticity that it never regains its original form. The tail is covered with a small bush of hair of the same description, but so short as to be scarcely perceptible among the long hair of the hips. The legs are more robust than in most other species of antelope, and the hoofs, instead of being pointed and flat beneath, are perfectly round and cylindrical, being worn only at the tips, upon which alone the animal treads. This peculiarity of structure in the hoof, and the rigid form of the pastern joints, which are perfectly stiff, and in a straight line with the canons, account for the amazing agility which the klipspringer displays in bounding among the most dangerous rocks and precipices.

The peculiar habitat of this species makes it impossible to hunt it with dogs, but it is easily shot as it exposes itself upon the naked rocks, and great numbers of the young are destroyed by eagles and other birds of prey which inhabit the same localities. In consequence of this, the animal is by no means common, and is becoming every day more scarce in situations where it most abounded formerly; the excellence of its venison and the value of its hair, which is held in great estimation for stuffing saddles and mattresses, hold out a powerful inducement to its destruction.

16. *A. acuticornis*, De Blainville. This species is only known from a mutilated skull and horns in the Museum of the College of Surgeons in London. The horns are round, vertical, very sharp-pointed, and perfectly smooth, without the least appearance of annuli at the base, nearly parallel throughout their whole length, and moderately curved forwards; they are three inches long, and little more than an inch in circumference at the base. The sinciput is narrow, square, and much elevated. These characters show the fragment in question to have belonged to a young animal. Colonel Smith adds, that it was brought from India, and considers it to be the species which Mr. Johnston alludes to in his *Sketches of Indian Field Sports* under the name of small deer, and which that author says is an inhabitant of the dense forests of the Rhamgur country.

17. *A. subulata*, Smith, is another species only known from the horns, which were likewise brought from India to the College of Surgeons, where they were observed by Colonel Smith, and afterwards figured and described by him in the fourth volume of Griffiths's *Animal Kingdom*. These horns are four inches and a half in length, an inch in circumference at the base, smooth, black, and sharp-pointed.

They are nearly vertical on the forehead, bending moderately outwards in the middle, and their points turning slightly inwards, and thus assuming something of the figure of a shoemaker's awl. Their distance at the base is one inch and two lines, and in the middle about two inches.

VIII. The eighth group into which we divide the genus *antelope* is distinguished from all those which precede it by the total absence of lachrymal sinuses, and by the beautiful spiral form of the horns, surrounded throughout the greater part of their length by a prominent wreath. The species comprised in this subdivision have likewise distinct naked muzzles and inguinal pores, but they want knee-brushes, and the females are without horns and provided with four mammae. They inhabit the forests of South and West Africa, and are the only antelopes distinguished by the variety of their colours, being more or less spotted and ribbed with white upon a dark or fallow ground. They live in pairs or small families.

[The Koodoo, *A. strepsiceros*.]

18. The Koodoo (*A. strepsiceros*, Pallas) is a magnificent animal of South Africa, and one of the largest of the antelope genus, measuring upwards of eight feet in length, and being four feet high at the shoulder. The horns of the male are particularly magnificent: they are nearly four feet long, and beautifully twisted into a wide-sweeping spiral of two turns and a half, surrounded by a prominent wreath which follows all their windings, and is gradually obliterated towards the points, which are rather blunt and directed outwards. They are thick at the base, and marked for some distance up with irregular wrinkles, but not annulated, dark brown at the bottom, black in the middle, and the extreme points white. They spread boldly and widely outwards, and are usually carried couched on each side of the back, on account of their great weight. The whole make of this animal is heavy: the head large and terminated by a broad muzzle, the ears broad and slouching, the limbs thick and robust, and the whole external appearance more nearly resembling that of an ox than of an antelope. The ground colour of the back and sides is a light fallow-brown, with a narrow white ribbon along the spine, and eight or ten similar bands descending from the back and passing obliquely down the sides and hips; the belly and under parts are pale silvery brown. On the neck and withers is a thin sparse mane of a brown colour, and the chin, throat, and breast are furnished with similar long hairs, forming a species of beard. The cheeks are marked with two or three round white spots, and a narrow grey line passes from the anterior angle of the eye down towards the muzzle. The tail is moderately long, and equally covered with short hair.

This magnificent animal inhabits the woody parts of Caffraria, principally along the banks of rivers, to which it readily takes when pursued, and swims well. It lives in small families of four or five individuals, is never found on the open plains, much less on the mountains, as M. Desmarest erroneously supposes, and feeds on the shoots and leaves of ~~various trees~~. Though a heavy animal, and by no means ~~of great~~ course, it leaps with surprising agility,

and has been known to clear a door of ten feet high at a single bound. The males are not deficient in courage, but defend themselves resolutely when driven to bay; when taken young, however, they are readily domesticated, and show no inclination to regain their original freedom. The females produce one young at a time.

19. The Boshbok (*A. sylvatica*, Sparman) is a much smaller animal than the koodoo, measuring about four feet from the nose to the root of the tail, and being two feet six inches high at the shoulder. The horns are nearly a foot in length, thick at the base and gradually attenuated, but ending in rather blunt points; they are twisted on their own axis, but do not form the wide-spreading spiral curves so remarkable in those of the koodoo: from the base, however, two sharp, prominent wreaths, one on the outer and the other on the inner surface, wind spirally round them for the first two-thirds of their length, and are gradually obliterated towards the points, which are smooth and polished. The ears are large and rounded at the tops, the limbs robust but clean and well-formed, and the tail of moderate length and similar to that of the common fallow-deer. The male and female are of different colours; the ground colour of the former is a dark sepia brown above, and white beneath, the head and cheeks being light and sandy-red, and the extremities fulvous; that of the latter reddish-fawn above and white beneath. Two pure white bands cross the throat, one at the junction of the head and neck, and the other at the union of the neck with the chest; the lips and chin are also white; round white spots mark the cheeks, and sometimes the nose in front of the eyes, and similar spots are dispersed irregularly over the hips and thighs, to the amount of a dozen or more on each side, sometimes even forming interrupted lines. The hair is of moderate length, but it is smooth and lies close to the body; the backs of the ears are covered with short brown hair; the tail is black above and white underneath, and the pastern joints are marked behind with two oblong spots of the same colour. In very old males the legs become almost uniformly grey, and at all ages there is a white line running down their inner surface even to the very hoof. All these marks are equally found in the females, but not being so prominently contrasted, on account of the lighter ground colour of this sex, they are not so conspicuous as in the males. There is frequently also a narrow white list along the back, but this is not a constant character in either sex, and is, for the most part, wanting in the females. The young males are of the same colour as the adults, but rather lighter, and the white spots on the hips and thighs more faintly marked.

The boshbok, or bush-goat, as its colonial name implies, resides in the woods, which it never quits but during the bright moonlight nights, or early in the morning, when it comes out to graze on the border of the forest, or to make incursions into the neighbouring gardens and corn-fields. Its voice resembles the barking of a dog, and its deceitful tone sometimes leads the benighted traveller into the most remote and lonely depths of the forest in the vain search after some human habitation, which he is all the time leaving behind him. It is a slow runner, and easily caught when surprised in an open situation, but it keeps close to the woods, through which it penetrates with great ease, running with the horns couched backwards along the sides of the neck, to prevent them from impeding its course by striking against the branches, and having the neck and throat frequently denuded by rubbing against the underwood, as it forces its passage through the thick covers. The species is monogamous, the male and female being always found either alone, or accompanied by one or two kids, but never by adult individuals. It is common enough in Caffraria, and in such parts of the Cape Colony as have sufficient forest to afford it a secure asylum; its flesh makes good venison, that of the breast being particularly esteemed.

20. The Guib (*A. scripta*, Pallas) has the same general characters as the boshbok, and the horns of the male are likewise similar, but it is smaller, lighter, and more delicately formed, and is said to live in society upon the plains, a circumstance which, if it can be relied on, forms a remarkable exception to the habits of the other species of antelopes included in the present group. It measures four feet and a-half from the muzzle to the root of the tail; its height at the shoulder is two feet six inches, and at the croup two feet eight; the horns are eight inches long, the ears five, and the tail six. The horns are straight, a little compressed and twisted spirally upon their axis with two wreaths passing

round them strongly marked at bottom, but obliterated within an inch or two of the points. The general colour is a reddish fawn marked with white lines and spots. The head is unmixed fawn-colour with a dark mark on the forehead and face, white spots in front and beneath each eye, and another on the cheek, at some distance beneath the opening of the ear; the sides of the upper lip and the whole space under the chin are likewise white. The neck is unmixed fawn, deep above and lighter beneath, with a white mark on the breast: the body likewise is deep fawn-colour, with a dorsal line of white and black hair intermixed, and rather longer than those on the rest of the body. From this dorsal line originate eight or ten narrow transverse ribbons of pure white, which pass obliquely down over the ribs and hips, and are crossed on the sides and flanks by one or sometimes two longitudinal bands of the same colour, running from the shoulder to the hips on each side, in a direction parallel to the dorsal line. All these markings are constant in the species and equally common to both sexes; they are at regular distances from one another, and, as Buffon has observed, present the appearance of a set of small harness. A few small, round, white spots are frequently also scattered over the hips and thighs, as in the boshbok, and the interior of the fore-arms, thighs and legs, are likewise of this colour, but the breast, belly, and under parts of the body in general are uniform fulvous brown.

The guib inhabits the west coast of Africa, from Sierra Leone to the banks of the Senegal, from the latter of which localities it was first brought to Europe by the celebrated Adanson. It is said to associate with its own species and to form extensive herds, which reside equally in the forests and on the open plains, particularly in the vicinity of Podor and Gorce, where these animals are very numerous. Guib is their name in the Jolloff language. The colours are sometimes subject to a slight variation as far as regards the number of longitudinal and transverse bands on the sides. Colonel Smith has considered this difference specific, and has bestowed the name of *A. phalerata* upon the variety with a single longitudinal line on the flanks, retaining the original name of *A. scripta* for the variety which is marked with two of these lines. This distinction, to say the least of it, is extremely doubtful, and the difference upon which it is founded is in all probability merely accidental.

IX. The ninth group of antelopes includes a number of species characterised by their distinct naked muzzles, horns in the male sex only, distinguished by a single curvature towards the point, more or less strongly marked according to the species, by their large inguinal pores, by the presence of four teats in the females, and by the absence of lachrymal sinuses and knee-brushes. This family is, like the last, exclusively African, the species residing in pairs or small families of five or six individuals in the hilly districts of the south and west coasts of the Continent, generally about the sources of mountain-streams, and among the sedges and reeds on the banks of dried-up river-courses. The qualities of their fur sufficiently indicate these upland and mountainous habitats. The hair is of a woolly texture, fine, close and warm, and in the young animals beautifully frizzled and parted into separate locks. Their legs are robust and powerful, and, though not deficient in point of beauty, they want the light form and graceful action which characterise the generality of the antelope genus.

21. The KONA, (*A. koba*.) called *Grande-Fache brune*, or large brown cow, by the French of Senegal, is in size equal to the European stag, being upwards of five feet in length, from the extremity of the muzzle to the root of the tail. The head, measured from between the ears, is fifteen inches long, and the ears themselves nine inches. The horns are twenty inches long, annulated throughout the first three quarters of their length, compressed on the sides, and in full grown animals having a tendency to assume a lyrate form with the point rather blunt and directed forwards. The horns of this animal were originally brought from Senegal by Adanson, and described and figured by Buffon and Daubenton in the twelfth volume of the *Histoire Naturelle*; from that period till very recently nothing further was known of the species, but within the last eighteen months two living specimens, a male and female, have been brought to England, and are now exhibited, the latter at the gardens of the Zoological Society in the Regent's Park, and the former at the Surrey Zoological Gardens. The hair, without being exactly coarse, is long and rough upon every part of the body, standing out from the hide in different directions,

[The Koba, *A. koba*.]

and forming round the neck a kind of rough bristly mane; the ears are long, pointed, and habitually directed forwards, and the tail, broad, and uniformly covered with hair, reaches to the hough, and is without a terminal tuft. The general colour of the body is a dark vinous red on the upper parts and silvery grey beneath, the former being tinged with dark brown along the spine and on the croup, from an intermixture of black hairs. The face and legs are also dark brown, almost approaching to black, the lips, chin, and under side of the tail white, and a longitudinal stripe of the same colour passes over the eyes in the form of eyebrows, and descends for some inches along each side of the face. The feet are marked with faint grey rings immediately above the hoofs, and the ears are internally striated with three longitudinal white lines.

The attitude of the koba when at rest very much resembles that of the nyi-ghau, the feet being gathered close under the body, and the tail pressed in between the hind-legs. In a state of nature its habits are altogether unknown; in confinement it is gentle and timid.

22. The KOB, (*A. kob*, Erxleben.) called *Petite Fache brune*, or little brown cow, by the French settlers on the western coast of Africa, is described as being about the size of the fallow-deer, and similar in colour to the koba, but the animal is only known by the skull and horns brought by Adanson from Senegal. These are pretty large, black, with a single concave curvature directed forwards, approaching one another at the points, and marked on the first two-thirds of their length with seven or eight prominent rings. The head is long and narrow, and without pits for the lachrymal sinus, showing therefore that this organ does not exist; its entire length is nine inches: the length of the horns is thirteen inches on the curves, and their circumference at the base five inches and a half: their distance from one another is eight lines only at the base, five inches in the middle, and two inches and a half at the points.

23. The REITBOK, (*A. elenragus*, Schreber.) or reedbuck, so called from its habit of frequenting the reedy banks and beds of dry water-courses, is four feet and a half in length, and two feet nine or ten inches high at the shoulder. The head is ten inches long from the muzzle to the base of the horns, the horns ten inches and a half in a straight line, and thirteen inches along the curves, and the tail eleven inches. The horns are round, annulated at the base, with prominent sharp rings and beautifully striated between, smooth and sharp at the points, and curved forwards with a bold and regular sweep, so as to form almost the segment of a circle. The ears are long and pointed, filled internally with a profusion of whitish hair, and beneath them, on each side of the head, there is a remarkable bald spot of an oval form and shining black colour, which is very characteristic of the species, and readily distinguishes it from all the other antelopes with which it is likely to be confounded. The hair over every part of the neck and body is long and rough, of a uniform dull ashy grey colour, sometimes tinged with red, on the upper parts, and silvery grey on the throat, breast, belly, and interior of the fore-arms and thighs. The

tail is long and remarkably bushy, being covered with a profusion of long woolly hair, for the most part of a white or grey colour, with a narrow brown line running down the middle of the upper side. The females are in all respects similar to the males, excepting that they are without horns, and of rather smaller stature.

[The Reitbok, *A. elatragus*.]

The reitbok is not found in the immediate vicinity of the Cape, but farther in the interior of the country it is by no means uncommon, living in pairs or small families, and, as already observed, frequenting the reeds and rushy banks of mountain-streams which flow only during the winter season, and are dried up by the summer heats. Sometimes also it is found in woods along the banks of rivers, but always in the neighbourhood of water, and a variety, if not a distinct species, is even said to inhabit the plains. This is of a very deep reddish fawn-colour, and has been described by Afzelius and Hamilton Smith as a distinct species under the denomination of *A. fideo-rufula*. Excepting in the redder shade of its colour, however, and the name of *Roude Rheebok*, or red roebuck, by which it is said to be distinguished among the Dutch colonists at the Cape, it does not appear to differ materially from the common variety, and the slight shades of variation which it does present, are most probably the effects of its difference of habitat and other accidental circumstances. The same may be said of the *A. Isabellina*, or cream-coloured antelope of these authors, which does not appear to present any characters sufficiently marked or peculiar to be considered as indicative of a specific distinction.

24. The NAGOR, (*A. redunca*, Pallas,) known only from the description of Adanson and the figure of Buffon, is a species so nearly resembling the reitbok that some naturalists have not hesitated to unite them. It is four feet long from the muzzle to the origin of the tail, two feet four inches high at the shoulder, and two feet six at the croup; the head is nine inches long, the horns five inches and a half, and the ears five inches. The horns have one or two annuli at the base, but are smooth and shining throughout the remainder of their length: they are erect, parallel, and almost straight till within a short distance of the points, where they curve forwards, but not so boldly as in the last species, &c. This

character appears to constitute their chief difference, though it is obvious, from the description, that Mr. Adanson's specimen was a young individual. The colour was uniform fawn or pale red, without any white about the breast or belly, and the hair was long, rough, and undulating, and did not lie smooth or close to the body, characters which all tend to approximate the animal to the reitbok, and more particularly to the variety which is said to inhabit the plains. It is found in the neighbourhood of Goree on the west coast of Africa.

25. The RHEEBOK (*A. capreolus*, Lichtenstein) is nearly five feet in length, and two feet and a half high at the shoulder; the head is six inches long from the muzzle to the root of the horns, the ears and tail, without the hair, about the same length, and the horns of the old male from nine to twelve inches. The head is long, and tapers gra-

dually to the muzzle, which is small, round, and of a black colour; the horns are perfectly smooth and without any appearance of wrinkles or annuli for the two-thirds of their length next the points, but exhibit a few obscure wrinkles at the base: they are remarkably slender, long, straight, parallel, and so sharp at the points, that the Hottentots and Bushmen use them in place of needles and bodkins; the ears also are long, very broad at the base, and attenuated towards the points; the tail long and bushy. The hair, or rather fur, is of a woolly quality, and of a uniform ash colour on the neck, shoulders, sides, croup, and thighs, and white or light grey on the breast, belly, and inner face of the arms and thighs. In young individuals it is beautifully frizzled or curled into distinct locks, and its colour is much clearer than in the adults, which have it straight, loose, and often tinged with a sandy-brown hue on the upper parts of the body. The hair of the legs in the young animal is likewise long and curly like that of a young lamb, but in aged specimens the legs are covered with short close hair of the common quality, and frequently with more or less of a dark brown colour. The hair of the head, face, and cheeks, is always short, crisp, and close: it is brown on the nose, light fawn on the forehead and cheeks, and white about the margins of the lips and underneath the chin; the tail is slaty grey above, and white below, and at the tip; and there is a conspicuous black spot at the angle of the mouth on each side. The hairs individually are obscurely annulated with alternate rings of a grey and light rufous-brown colour, the latter becoming more conspicuous as the animal advances in age, and communicating to the general colour of the fur the light rufous shade already mentioned.

The rheebok is of a lighter and more graceful form than the generality of the other antelopes included in the present section. The body is long and small, the neck particularly so, and the legs slender and well-proportioned. Its pace, consequently, is proportionally swift; it runs with great velocity, keeping close to the ground and moving by long strides, and with a motion so rapid and uniform, that it seems to glide rather than run. The rheeboks live in small families of five or six individuals, consisting of an adult male and three or four females with their young; the males are pugnacious, and compel the young of their own sex to separate themselves from the family as soon as they become adult. Their general residence is on the sides of moderate hills, among stunted trees and underwood, or in the rocky glens and mountain passes, in the vicinity of the little pools of water which remain after the winter torrents have ceased to flow. Wherever such situations are found, the rheebok is not an uncommon animal in South Africa; its flesh is dry and insipid, and esteemed less than that of any other of the numerous Cape antelopes. The female produces but one at a birth, which grows rapidly, and, if caught at an early period, is readily domesticated.

26. *A. lundiana*, Desmarest, appears, from the description of this author, to be a species very nearly allied to the rheebok, but differing in the quality and colour of the hair, and in the white marks above the eyebrows. The horns of the male are slender, straight, parallel, very sharp-pointed, and rather shorter than the head; the body is rather large, the legs robust, the ears of moderate size and rounded at the points, the tail twice the length of the ears, covered with hair of the same length throughout, and not descending lower than the hough, the hair of the body long, harsh, and not frizzled. The back, flanks, and sides are uniform clear greyish brown, as are likewise the croup, hips, and thighs, the legs becoming gradually darker brown towards the pasterns. The belly, breast, interior of the fore-arms, and thighs, under surface of the tail, throat, chin, lips, and a line over the eyebrows, are white, the colours of the sides and belly being separated on the flanks by an oblique longitudinal line. This animal is said to have the habits as well as the external form of the rheebok, living in small families in the mountainous districts about the Cape of Good Hope, and never by any chance descending into the plains.

X. The tenth group of the genus *antelope* exhibits a character which readily distinguishes it from all those which have preceded, in the possession of maxillary sinuses, or lengthened glands on the cheeks, which distil a dark oily substance, and are sometimes found alone, and at other times accompanied by the presence of lachrymal sinuses. The horns, as we have hitherto found, are confined to the male sex; they are round, short, slightly annulated or

striated at the base, and have a slight curvature backwards or forwards; the head is terminated by a distinct naked muzzle; one species only possesses knee-brushes, and the females have two teats and large inguinal pores. These animals inhabit the moist tropical forests of Africa, and the great islands of the Indian Archipelago, and live in pairs among the underwood.

[The Cambing Outang, *A. Sumatrensis*.]

27. The CAMBING OUTANG, (*A. Sumatrensis*, Desmarest,) first noticed by Mr. Marsden in his *History of Sumatra*, is about four feet and a half in length, and two feet three inches high at the shoulder. The horns are six inches long, very thick at the base and much attenuated, slightly and uniformly curved backwards. The muzzle is distinct and well formed, the lachrymal sinuses open by a small circular aperture, and between them and the muzzle, on each side, is a long linear space, nearly two inches in length by a quarter of an inch broad, naked, and covered with a soft black integument, which represents the maxillary gland, and secretes a particular humour. The ears and tail are of moderate length, the hoofs very large, the limbs short and stout, and the whole form of the animal robust and powerful. The body is thickly covered with a coat of long hair, of a dark brown colour, almost black, excepting along the nape of the neck, on the shoulders, and inside the ears, where it is white, and under the lower jaw, which is of a deep straw-colour. The white hairs of the neck and shoulders are much longer than on other parts of the body, and form a kind of flowing mane; the hair on the head and limbs, on the contrary, is much shorter than elsewhere, the knees are without brushes, and the tail, which is rather shorter than the ears, is covered throughout its whole extent with hair of moderate and equal length, and of the same dark-brown colour as that on the body.

The cambing outang, or wild goat, so called by the Malays, inhabits the hilly forests of Sumatra, and is described by Mr. Marsden as being of a wild character, extremely active and sure-footed, and with much of the habits and character of the common goat and ibex, of which it has the roving fearless eye, and bold undaunted bearing.

28. The FOUR-TUFTED ANTKLOPE (*A. quadriscapa*, Hamilton Smith) is known only from Colonel Smith's description and figure of a male specimen formerly exhibited at Exeter Change. The individual, from which Colonel Smith's description was taken, was brought from Senegal.

29. The BUSH ANTKLOPE, (*A. silvicultrix*, Afzelius,) called bush-goat by the English residents at Sierra Leone, is about five feet in length from the muzzle to the root of the tail, three feet high at the shoulder, and three feet two inches at the croup; the head, measured from the muzzle to the base of the horns, is upwards of ten inches long, the horns and ears each four inches, and the tail with the hair half a foot. The circumference of the horns at the base is three inches, and their distance at the points five inches; they grow entirely in the direction of the forehead, are pointed, black, shining, nearly straight, with a slight inclination backwards, and diverging gradually towards the points. For about half an inch from the base they are finely

marked with a number of small transverse strise, then covered for about an inch with little depressions and inequalities, and smooth from thence to the points. The ears are situated rather close to the horns: they are about the same length as these organs, broad, open, rounded at the top, and nearly naked; the eye-lids are bordered with thick black lashes, the tail is bushy and pendent, the buttocks nearly naked, the limbs short and slender, the knees unprovided with brushes, and the female furnished with two teats. The hair is, in general, remarkably short, sleek, and shining, of a deep brown colour, rather paler on the neck and flanks, mixed with grey on the thighs, almost yellow on the throat, dun on the cheeks and sides of the jaws, clear brown on the face, nose, and backs of the ears, and chestnut brown on the legs and feet. A tuft of long hair surrounds the base of the horns, and along the middle of the back is a longitudinal line of silvery grey which expands upon the croup, and is provided with hair considerably longer than that on the rest of the body. The tail is black, covered with moderately long hair, and without a terminal tuft.

The proportions of this species are heavy and ungainly, and bear a considerable resemblance to those of the hog deer of India. The legs are short and slender, and appear disproportioned to the size of the body, which is large and heavy; the head, too, is thick and clumsy, though much attenuated towards the muzzle, the neck short and thick, the croup depressed, and the back very much arched. This species inhabits the west coast of Africa, about Sierra Leone, and the sources of the Pongas and Quia Rivers. It frequents the thickets and underwood of the upland plains and moderate mountain declivities, keeping close to the cover during the day-time, and quitting it only at early dawn for the purpose of feeding in the neighbouring meadows. It is at this time that it is pursued by the hunters, who station themselves on the margin of the woods, and shoot it as it comes out to graze. It is a slow, heavy runner, as might be anticipated from the size and corpulent make of its body, and the shortness of its legs; but it affords excellent venison, and is much sought after on that account. It has long maxillary glands, but no appearance of lachrymal sinuses.

30. The DUIKERBOK (*A. mergans*, Blainville) is of a more active make, and has more graceful proportions than the species last described. In other respects, however, its characters are precisely the same: it has a long maxillary gland on each side of the face, running nearly parallel to the plane of the head, no appearance of lachrymal sinuses, nor brushes on the knees, and the females are provided with two teats. The horns are upright, straight, black, smooth, and very sharp at the points, annulated at the base with a few small rings, and compressed slightly on the sides so as to form a sharp edge in front; but this is not always apparent in old specimens, being perhaps rubbed off or obliterated by friction against the branches and underwood among which the animal resides. They are between four and five inches long, nearly parallel, and point almost imperceptibly forwards. The ears are four inches and a half long, narrow, pointed, and upright; and on the crown of the head, immediately between the roots of the horns and ears, is a remarkable tuft of long black hair, growing from a small centre, and falling round in every direction like the radii of a circle. This is more particularly conspicuous in the females, from the absence of horns in that sex; but besides this black tuft, the whole forehead is covered in both sexes with long hair of a deep red colour, directed upwards, and in the males partly concealing the base of the horns. The body is about four feet in length, and two feet high at the shoulder. It is covered uniformly with rather long but smooth hair of a light brown colour, with a very faint shade of yellow above, and ashy greyish brown beneath. The face and nose, from the eyes to the muzzle, are dark brown; and the legs, over the whole canons before, and half way up behind, are shining black, equally conspicuous at all ages and in both sexes. The tail is six inches long, rather flat, and covered with moderately long black hair, but not tufted.

The duikerbok, or diving-goat, so called by the Dutch of South Africa from its habit of plunging under the bushes in its passage through the woods, instead of leaping over them like the generality of other antelopes, is a common animal in Caffraria and in all parts of the Cape colony which it seldom ventures, unless occasionally at night to steal into a neighbouring garden. It is found alone or in pairs, makes its way readily among the thickets and low bushes,

and when pursued will from time to time stand up on its hind legs to look round it, then dive under the branches to reappear again at some distance, and thus alternately continuing its flight and standing up at intervals to watch the motions of its pursuers. The peculiar nature of the humour secreted by the maxillary glands of this animal has given origin to a common saying among the Dutch colonists, that it carries the gall-bladder under the eyes. This species is most probably the animal of which the female was long since imperfectly described by Grimm, and which has been admitted into systematic catalogues under the name of *A. Grimmeri*. The *L. pta* of Colonel Smith likewise appears to be identical with, or at most a casual variety of the duikerbok, the characters upon which the separation is made being by no means constant, and some of them even of doubtful authenticity.

31. **BURCHELL'S ANTELOPE** (*A. Burchellii*, Smith) is a species which, from the description of Colonel Smith, though closely resembling the Duikerbok, yet seems to be really different, and to possess appropriate characters which readily distinguish it. The specimen procured by Mr. Burchell during his travels in South Africa was afterwards deposited in the British Museum.

32. **THE BROAD-EARED ANTELOPE** (*A. platous*, H. Smith) is another species of rather doubtful authenticity, described by Colonel Smith from a specimen in the Museum of the Missionary Society, said to have been brought from South Africa.

XI. The eleventh section or group into which we divide this genus begins to exhibit a new character, which we have not found in any of the former divisions, but which is common to all the remaining species of antelopes. It is the presence of horns in the female sex—a character which has a decided influence upon the habits and economy of these animals, not only as it affects the relation which subsists between the sexes by rendering them in a great measure independent of one another, but likewise in modifying the general manners of the species. Those of the present group are further distinguished by having complete naked muzzles, maxillary glands without lachrymal sinuses, inguinal pores, no knee-brushes, and four teats in the females. From the group last described they differ principally by the females being provided with horns, and having four instead of two teats, and by their small size: the present section being composed of the smallest of all horned quadrupeds, except, perhaps, the madoqua, already described. Like the species of the last group, they live singly or in pairs among the bushes or underwood, and rarely venture willingly to quit the thick cover of the woods and forests. As far as is at present known, their habitat is exclusively confined to Africa. There is no group of antelopes in which so much confusion reigns throughout the specific descriptions of naturalists as the present. At least two or three distinct species are known to inhabit the Cape of Good Hope and the west coast of Africa, but their names have been so confused, and their distinctive characters consequently so confounded, that it is now almost a hopeless task to attempt to separate them again, or to attribute to each what properly belongs to it.

33. **THE GRIMM**, (*A. Grimmeri*, Desmarest,) the Grimmer of MM. F. Cuvier and Desmarest, is certainly a different species from that of Pallas, which is the Kleenebok of the Cape, and likewise from the animal originally described by Dr. Grimm, and which, as we have already observed, appears to be the duikerbok. The original grimm was brought from the Cape of Good Hope, and was described from a female specimen without horns: the animal at present under consideration, and which has rather arbitrarily assumed its name, is an inhabitant of Sierra Leone and the coast of Guinea, and is probably the real Guevi of Adanson's *Travels in Senegal*. A male of this species formerly lived in the menagerie at the Jardin des Plantes at Paris, and was the subject of the foregoing description: it was brought from the coast of Guinea, and showed an extreme timidity in confinement: its habits in a state of nature are unknown.

34. **THE KLEENEBOK**, (*A. perpusilla*, H. Smith,) very improperly called guevi by M. Desmarest, is about a foot high at the shoulder: the horns an inch and a half long in the male, three-quarters of an inch in the female, and the tail about two inches and a half. The horns are small, erect, black, slightly inclined backwards and towards one another at the points, and very sharp, with seven or eight minute annuli at the base; the ears about the same length as the horns, perfectly round at the tips, and nearly naked

[The Kleenebok, *A. perpusilla*.]

within; the head is long and pointed: the maxillary glands not parallel to the plane of the face, but nearly in the same line with the greater axis of the orbits, or rather in lines parallel to them; the forehead and nose are brown, bordered on each side by a narrow line of a sandy-red colour passing from the root of the horns down to the muzzle; the upper parts of the body are of a uniform dark slaty-brown colour; all the inferior parts, including the region under the chin, the breast, belly, interior of the fore-arms and thighs, and under-surface of the tail, ashy-grey, inclining to white in some specimens, particularly in young individuals; the legs are reddish-brown, and the hoofs small, narrow, and pointed.

This species, called by the Dutch colonists of the Cape *Kleenebok*, *Kleene blauw-bok*, *Blauwbokje*, all signifying little goat or little blue goat, inhabits South Africa, and lives singly or in pairs among the bushes. It is extremely active, and of a mild and timid disposition, but from the nature of the thick bushes in which it resides is not often seen even in those districts where it abounds most plentifully. It is said to exhibit considerable sagacity in eluding pursuit, and when domesticated soon becomes familiar and learns to distinguish those about it and to answer to its name. This species is also the *A. cerulea* of Colonel Smith and the *A. pygmaea* of M. Desmarest, who confounds it with the *guevi* of Senegal.

35. **MAXWELL'S ANTELOPE** (*A. Maxwellii*, H. Smith) is a species described only by Colonel Smith. The female specimen, from which Colonel Smith's description was taken, lived two years in England, and produced a kid in confinement.

36. **THE GUKVI**, (*A. pygmaea*, H. Smith,) said to be the smallest, and certainly the least known, of the whole antelope genus, was first mentioned by Adanson, as an inhabitant of Senegal, and the name has since been arbitrarily applied by different zoologists to two or three distinct, though ill-determined species. It is the royal antelope of Pennant; and though the female is described, on the authority of Bosman, as being destitute of horns, it is probable, from the other characters attributed to the species, that this fact is not correct, but arises from want of careful examination, and that the animal really belongs to the present section. The horns of the male are described as short, straight, black, polished, and not quite two inches long; the ears broad and round; the legs not thicker than a goose-quill; the height scarcely nine inches, and the colour a uniform reddish-brown. Notwithstanding its very diminutive size, it is said that the guevi will bound with ease over a wall twelve feet high. It is readily domesticated, but too tender to endure the cold of Europe. Adanson mentions a still smaller species or variety of guevi, which is said to inhabit the province of Kaor, on the northern banks of the Gambia, and to be not much larger than a good Norway rat. It is upon this animal that Buffon appears to have founded his *Chevrotaïne de Guinée*, and Linnæus his *Moschus pygmaeus*.

XII. We have now arrived at a group of antelopes which have been celebrated, from the most remote antiquity, for the beauty of their external forms, the grace and elegance of

their movements, and the mildness and gentleness of their manners. Of this group, the common gazelle or Barbary antelope may be considered as the typical representative; but this animal is itself so closely related to two or three neighbouring species, that it has been found very difficult to distinguish them by characters at once sufficiently marked and constant. The group, however, is collectively characterised by prominent and peculiar traits which are in a great measure appropriate, and which definitely separate it from all other sections of the antelope genus. The principal of these consist in having the horns common to both sexes, more or less compressed on the sides, annulated nearly to the points, and lyrate, or with a double curvature, first backwards at the base, and afterwards pointing gently and moderately forwards, in the males; short, round, smooth, straight, and upright till within an inch of the points, which turn abruptly inwards towards one another, in the females; in the form of the upper lip, which is hairy and attenuated like that of the goat; in the possession of distinct suborbital sinuses without any appearance of the maxillary glands which characterise the last two groups; in the presence of very large inguinal pores, and, in most species, brushes on the knees; and in the females being provided with four mammae or teats. The species belonging to this division are, for the most part, gregarious, living in large flocks on the open plains, karroos, and steppes of Africa and Asia, feeding upon the aromatic herbs and saline plants of the desert, and uniting for mutual defence against the attacks of wild beasts.

[The Gazelle, *A. dorcas*, Pallas.]

37. The GAZELLE (*A. dorcas*, Pallas) is three feet six inches in length, one foot nine inches and a half high at the shoulder, and one foot ten and a half at the croup; the head is six inches long, the horns nine and a half, the ears four and three-quarters, and the tail, with its terminating tuft, eight inches. The horns of the old male are surrounded by thirteen or fourteen prominent rings, complete and close together at the base, more distant, oblique and interrupted behind towards the points, the last inch or inch and a half alone being smooth and free from annuli; they rise almost immediately above the orbits, are black, almost cylindrical, at first bent gently backwards, and finally forwards; in the females they are much smaller, seldom exceeding the ears in length, surrounded at the base with a few obscure wrinkles, smooth and polished throughout the rest of their extent, straight to near the tips, and pointing inwards. This is the character of the *corinne* of Buffon, which is now considered by the best zoologists to be nothing more than the female either of this or the following species, and not itself a distinct species, as was formerly supposed. The ears of the gazelle are long, narrow, and pointed, the eyes large, mild, and black, and the tail round, furnished on its upper surface only with an upright ridge of stiff black hair, and terminated by a little tuft of the same colour; the size of the body is about equal to that of the roebuck, but the legs are considerably longer, and the whole form lighter and more elegant; the face and cheeks are reddish fawn-colour, and the nose has a broad

mark of a dark brown colour, approaching to black; on each side of the face, passing over the eyes from the horns down to the nose, there is a broad white stripe, and beneath this, from the anterior canthus of the eye, a narrower dark stripe, parallel to it and separating it from the fawn-colour of the cheeks; the hind part of the head, the back of the ears, neck, shoulders, back, sides, and croup, are fulvous, of different shades according to the age of the individual; all the under parts are white, and this colour is separated from the fulvous of the sides by a broad dark-brown longitudinal band on the flanks; the knees are furnished with brushes of dark hair, and the ears are filled internally with long white hair arranged in three longitudinal striae.

The gazelle is found in Egypt, Barbary, and some say also in Asia Minor; but it is very questionable whether the animal of the Levant does not really belong to a different species, to the *Antelope Arabica*, or perhaps to the *Antelope subgutturosa*. It lives in large troops upon the borders of the Tell, or cultivated country, and the Sahara, or desert; when pursued, flies to some distance, then stops to gaze a moment at the hunters, and again renews its flight. The flock, when attacked collectively, disperse in all directions, but soon reunite, and, when brought to bay, defend themselves with courage and obstinacy, uniting in a close circle, with the females and fawns in the centre, and presenting their horns at all points to their enemies; yet, notwithstanding their courage, they are the common prey of the lion and panther, and are hunted with great perseverance by the Arabs and Bedouens of the desert. When taken young, they are easily domesticated, and soon become familiar. This animal is frequently cut upon the monuments of Egypt and Nubia.

38. The KEVEL (*A. kerella*, Pallas) is still very imperfectly distinguished from the gazelle, but appears to be in reality a different species, characterised principally by the compression of its horns, their being provided in the adult male with a greater number of annuli, and bending forwards with a more bold and sudden curvature at the points. The habitat also of these two animals is different, the kevel being found only on the opposite side of the great African desert to that inhabited by the dorcas; and this is itself a strong argument in favour of those who maintain their specific difference, though it must be admitted that they require a careful examination and comparison. This species is found in Senegal, where, according to the report of Adanson, kevel is its name among the natives. It resides in extensive flocks on the open stony plains, and is said to be in all respects similar to the gazelle in its manners and habits.

39. The AHU (*A. subgutturosa*, Guldénstædt) is likewise a species which requires to be re-examined, and carefully compared with the gazelle and kevel, not that there is any reasonable doubt as to its actual existence, but because its characters have not been sufficiently distinguished from those of the conterminous species, which has given rise to no small confusion and fluctuation of opinion upon this part of our subject. The ahu inhabits all the central parts of Asia, Persia, Dauria, the country around lake Baikal, and from the eastern limits of Great Bucharra to the shores of the Hellespont. It associates with its own species in extensive flocks, frequents the open uncovered plains and naked hills of moderate elevation, and feeds principally upon the *absinthium Ponticum*. The flesh is much esteemed, and of an agreeable taste.

40. The KALSEKPEE, (*A. Bennettii*, Sykes,) described by Colonel Sykes in the first part of the *Proceedings of the Zoological Society*, is an elegant species closely allied to the dorcas in all its most prominent characters, but higher on the limbs, and considerably different in its habits. This species seems to be the *antelope cora* of Colonel Smith.

The kalseepoo, or black-tail, so called by the Mahrattas, on account of the deep black colour of that organ, and distinguished by the name of the goat antelope by the Europeans, is found on the rocky hills of the Deccan, and, according to the report of Colonel Sykes, differs from most other antelopes of the present section in not being gregarious, there being rarely more than three or four found together in the same company, and not unfrequently a solitary individual.

41. The ABIEL ANTELOPE, (*A. Arabica*, Hemprich and Ehrenberg,) so called by the Arabs on account of its light, elegant, and graceful form. The size and proportions of this animal are similar to those of the gazelle and other

species already described in the present section; the colour, however, is considerably deeper and darker than that of the common dorcas.

This species inhabits Arabia, and was found on the stony hills along the eastern shore of the Red Sea, by the travellers Hemprich and Ehrenberg, whose recent journey in northern Africa and western Asia has been productive of such a vast collection of new and interesting zoological riches.

[A. Scemmeringii.]

42. *A. SCEMMERINGII*, (Cretzschmar,) one of the most beautiful antelopes of this section, was discovered by Rüppel, (during his journey through the northern provinces of Abyssinia,) and is described by Cretzschmar in the zoological part of that traveller's works. It is considerably larger than the species hitherto described in the present group. The horns are irregularly lyrate, bending boldly outwards towards the points, and then suddenly turning inwards towards one another, with a very sharp and well-defined curve: annulated with fifteen or sixteen prominent and complete rings which reach from the base to the inward curvature within about two inches and a quarter of the points. The colour of all the upper parts of the body, the neck, shoulders, back, croup, sides and outward faces of the fore-arms and thighs, is a beautiful clear isabel or yellowish dun, the hair being extremely short, and appearing almost as if it had been clipped or shorn. It does not lie close and smooth upon the hide, nor does it all follow the same direction, as in the generality of animals, but is disposed in innumerable small waves, pointing in different directions, as if it had been regularly shaded and parted on each side, and appearing glossy or glazed along their ridges with a shining dun shade, more or less intense according to the light in which it is observed. All the under parts of the body are of the most pure and brilliant white, and a large disk of the same colour surrounds the tail and passes over the rump and croup. The white of the belly also is separated from the yellowish dun of the sides, immediately, without being shaded off. The tail is small and slender, nearly naked at the root, and furnished at the extremity with a tuft of mixed brown and grey hairs. The outsides of the legs are very pale fawn-colour, the insides white, and the knee-brushes white and fawn mixed. The ears are pretty long and brown, with a narrow black border sur-

rounding the
he
he
es

there is an indication of a small black one from the anterior angle of the eye to the corner of the mouth, separating this white band from the cheeks and sides of the lower jaw, which are uniform fawn-colour. The horns of the female have nearly the same curvature as those of the male, and are fully as long, but they are much more slender, and have not such prominent annuli. This is the only external difference observable between the sexes.

This antelope frequents hills of moderate ascent and elevation in the eastern provinces of Abyssinia, and is said to live in pairs, and not to unite into large flocks like the gazelle and kvel.

43. The *SPRINGBOK*, (*A. euchore*, Forster,) called likewise *Pronkbok*, or Showy goat, by the Dutch of South Africa, and *Tesbé* by the Hottentots, is perhaps the most graceful in its proportions, and beautifully varied in its colours, of all the antelope tribe. Imagination cannot conceive a quadruped more light and airy in form, more delicate in its proportions, or whose movements are executed with more natural ease and grace, than the springbok, or, as the English colonists now universally denominate it, springbuck. In point of size it is nearly a third larger than the dorcas. The horns of the springbuck are rather irregularly lyrate, like those of the species last described; they are round, black, annulated very regularly till within a short distance of the points, spreading first backwards and widely outwards, and finally turning inwards, and with an almost imperceptible twist on their own axis backwards. The hair is long on the upper parts of the body, particularly on the back and croup, but smooth, sleek, and shining: it is of a beautiful light cinnamon-colour on the shoulders, neck, back, sides, and thighs, and of a pure snowy white on the breast, belly, and inner face of the limbs, these two colours being separated on the flanks by a broad longitudinal band of a deep vinous red colour, larger and more distinct than in any other species of antelope. The whole head, face, cheeks, and chin are white, with a broad brown band on each side from the eyes to the corners of the mouth, and a mark of the same colour on the centre of the face, commencing in a narrow point on the muzzle, and enlarging as it proceeds upwards, till it joins the reddish fawn-colour of the body on the crown of the head. The eyes are large, lively, and of a brown colour; the ears long, small, and cylindrical at the root, then widening in the middle, and ending in an attenuated point. The neck is long, slender, and slightly compressed on the sides, the hoofs are small, black, and triangular, the legs remarkably long and slender, and the tail small, round, and naked, except a ridge of stiff black hair which fringes it along the upper surface, and forms a small tuft at the extremity. But the most remarkable and distinctive character of this species consists in two longitudinal foldings or duplications of the skin on the croup, which commence above the loins, or about the middle of the back, and run in a straight line from thence to the tail. The interior of these folds is lined with long hair of nine or ten inches in length, and of the most brilliant and snowy whiteness; they are likewise under the complete command of the animal's volition, and are opened and shut at pleasure. When closed, which they always are when the animal is at rest, their lips form a narrow line along the top of the loins and croup, which, being covered by the long cinnamon-red hair of the back and hips, is scarcely distinguishable, or only as a narrow white streak; but when the animal leaps or runs, these folds are expanded, and form a broad circular mark of the purest white, which extends over the whole croup and hips, and produces a most remarkable and pleasing effect.

The springbuck is so called from its remarkable habit of jumping almost perpendicularly upwards, apparently without any other motive than for its own amusement. It roams, in almost innumerable flocks, on the dry arid plains and karroos of the interior of South Africa, seldom approaching the inhabited districts of the colony, unless in seasons of peculiar drought, when the pools and pastures of the interior are dried and burnt up by the excessive heat, and these animals are compelled to migrate in search of a more abundant supply. On these occasions they are said to unite into flocks which often consist of from ten to fifty thousand individuals, spreading over the face of the country.

of locusts, dev
meet with, and
avoid the men
another directio

which happen to get into the rear or the troop are lean and half starved before the migration is concluded, from the advanced ranks cropping the scanty pastures almost bare, and thus leaving them nearly destitute of food; but when the journey is concluded, and the troop begins to retrace its steps northwards, those which formed the van during the advance are necessarily in the rear returning, soon lose their plump condition, and are in their turn subjected to want

and starvation. During these migrations they are closely followed by lions, panthers, hyenas, and wild dogs, which destroy great numbers of them. There is perhaps no object in nature finer than a flock of these beautiful antelopes enlivening the dreary brown karroos of South Africa with their graceful motions, now leaping perpendicularly upwards to the height of six or seven feet, displaying at the same time the snowy white marks on their croups, and anon flying over the desert with the speed of a whirlwind. It is only when disturbed, or otherwise excited, that they make those extraordinary springs from which they have derived their name; nor do they ever display the white mark on the rump except on these occasions. They are said to be particularly affected by the change of the weather, and are observed to leap more than usual before the setting in of the south wind, which, at the Cape of Good Hope, generally betokens stormy weather, and is always violent and tempestuous. When taken young, the springbuck is easily tamed, and soon displays all the petulance and familiarity of the common goat, butting at every stranger that approaches it, and warding off stones or other objects thrown at it with its horns.

44. The BLESSBOK, (*A. pygarga*, Pallas,) also a South African species, is considerably the largest animal belonging to the present group: it is, in point of size, superior to the stag of Europe, measuring, when full grown, five feet and a half in length, and rather more than three feet and a half in height at the shoulder. The horns are sixteen inches long, large, regularly lyrate, and of the same form in both sexes, those of the males being only thicker and heavier than those of the females. They are round, annulated with eleven or twelve prominent rings which reach to within a couple of inches of the points, rather close at the base, regularly but moderately divergent, and five inches separate at the tips. The ears are seven inches in length, erect, pointed, and cylindrical, reddish-fawn colour on the back and white within, with the usual longitudinal stria. The colours of the head and body are most singularly disposed; the whole animal appears as if it had been artificially painted with different shades laid on in separate masses. The head and neck are of a brilliant brownish-bay, so deep as to resemble the colour of arterial blood; this is particularly visible upon the cheeks and about the root of the horns, from the central point between which descends a narrow stripe of the purest white as far as the orbits, immediately above which it expands and covers the whole face and nose down to the muzzle, forming a broad mark, or, as it is called in horses, a blaze, and giving origin to the name of *blessbok* or *blazeback*, by which this species is known among the Cape colonists. The back is of a brownish-bay, thickly overlaid, or, as it were, glazed or japanned with dull purplish-white, and there is a very broad purplish-brown band on the flanks passing from the fore-arm backwards, and extending obliquely over the outer face of the thighs. The breast, belly, and interior of the fore-arms and thighs are white, and this colour also shows itself on the posterior face of the hips and thighs, and passes in a small crescent over the rear of the croup, forming a white disk around the tail, and giving origin to the specific name of *pygarga*, which has been rather arbitrarily bestowed upon this animal, the real *pygarga* of the ancients being certainly a different species, and an inhabitant of northern Africa. The tail is long and switchel, nearly naked at the root, and terminated by a tuft of very long black hair; the trunk alone is seven inches in length, and the terminal tuft four inches more, making the tail altogether about a foot long. The knees are without brushes, but M. Desmarest, and indeed the generality of naturalists who have described it, are mistaken in supposing this species to be without lachrymal sinuses.

This splendid animal, which is likewise called *bontebok* or painted goat, by the Dutch, was formerly very common in the colony of the Cape, and is still found in the district of Zwellendam, east of Cape Town, but it has long ceased to abound in the enormous multitudes which old travellers mention to have spread over the plains like a troop of springboks. The young are at first of a brownish-red colour on the body, partially glazed, as in the adults; but what is most remarkable of all is, that the face, instead of being white as in the grown animal, is of a very deep brownish-black colour, slightly mixed with scattered grey hairs. This singular mark of nonage, which could not have been well anticipated, has given rise to the very natural and pardonable error of Mr. Woods, who, in the 16th No. of the *Zoological*

Journal, has described the young *blessbok* as a distinct species, under the name of *A. personata*. The mistake is pointed out in Smuts's *Dissertatio Zoologica*.

XIII. The thirteenth section of the genus *Antelope* contains a small but interesting group of these animals, which Mr. Bennett has formed and characterised in the first volume of the *Transactions of the Zoological Society*. It comprehends the species which Pliny has mentioned under the name of *dama*, and is distinguished from the last section only by the character of the horns, which are larger, thicker, and have much bolder curvatures, turning first almost horizontally towards the rear, and then suddenly forwards so as to form a hook towards the front almost as complete as that of the chamois is towards the rear. The legs are remarkably long, the neck long and slender, and there is a white spot on the throat of all the species. In other respects the characters are precisely the same as those of the species belonging to the twelfth section.

[The Mhorr, *A. mhorr*.]

45. The MHORR (*A. mhorr*, Bennett) is four feet two inches long from the nose to the origin of the tail, two feet six inches high at the shoulder, and two feet eight inches at the croup; the length of the head from the nose to the root of the horn is seven inches; that of the horn nine inches and a half on the curve, and seven and a half in a straight line; and that of the tail seven inches without the terminal tuft. The hair of the body is sleek and of moderate length; on the head and face it is very short and close, except about the root of the horns, where it is slightly tufted; the hair of the limbs is also short, except the tufts below the knees, which are long and consist of a mixture of dark brown and grey hairs. The horns are thick at the base, and annulated with eleven or twelve prominent and complete rings, which occupy about two-thirds of their entire length; they are round, smooth, and attenuated towards the tips, which point directly forwards, and are but moderately sharp. The ears are narrow, erect, and pointed; the eyes large, dark, and lively; and the tail long, naked at the base, and furnished at the extremity with a tuft of long black hair. The colour of all the upper parts of the body, of the neck, back, shoulders, sides, fore-arms and thighs, as well as of the whole throat except a square spot on the larynx, is a deep brownish-red, and a narrow stripe of the same colour is continued down the outer face of the legs, both anterior and posterior, from the shoulders and thighs respectively to the hoofs and pasterns; the belly, buttocks, posterior face of the thighs and inner face of the extremities are pure white, as well as the spot on the larynx above referred to; and this colour, after spreading round the entire region of the tail, is continued forwards on the hip in a pointed stripe on each side, about half way between the croup and the knee joint, and reaching nearly over the whole hip. It contrasts strongly with the surrounding colour, and has a very singular effect. There is no dark band on the flanks, the light colours of the under parts being abruptly separated from the darker shade above without any blending or intermediate colour. The head and cheeks are light fawn-colour, intermixed, in front of the horns, with dark brown and grey hairs, and marked

below the opening of the suborbital sinuses with a small dark spot representing the black band which passes in the species of the last division from the anterior canthus of the eye to the corner of the mouth: the whole line of the nose and chaffron are likewise dark brown, mixed with grey in old specimens, and the back of the ears is fawn-coloured, tipped with black.

Two males of this beautiful species were sent from Mogadore to the Zoological Society, and lived for some time in the gardens of the Regent's Park. The species is not found in the empire of Morocco, but individuals are occasionally brought from the opposite confines of the Desert: the animal is much sought after by the Arabs on account of producing the bezoar stones so highly valued in eastern medicine. These stones are commonly called in Morocco, Bad-el-Mhorr, mhorr's eggs.

16. The NANGUER (*A. dama*, Pallas). This species was originally described and figured by Buffon from materials brought by Adanson from Senegal: since that time the animal has not been seen by any naturalist, and as the description of Buffon is imperfect, some reasonable doubt may be entertained whether it be not in reality the young of the mhorr.

The ADDRA (*A. ruficollis*, H. Smith) is a beautiful species of eastern Africa, discovered on the barren wastes of Nubia by Rüppel, and in Senaar and Dongola by Hemprich and Ehrenberg. The whole length of this species is five feet four inches, its height at the shoulder three feet: the length of the head is eight inches, that of the horns twelve inches and a half, and that of the tail nine inches. The horns are precisely similar to those of the mhorr already described, as are likewise the general form and proportions of the body. This species is gregarious, and resides in flocks on the desert between Nubia, Dongola, and Kordofan.

XIV. The fourteenth group of antelopes is distinguished by having small horns perfectly smooth and black, springing immediately above the orbits, almost perpendicular to the plane of the face, and straight for the first two-thirds of their length, then bent abruptly backwards so as to form a perfect hook, very sharp at the points, and common to both sexes. The lips are hairy and attenuated: there is no lachrymal sinus nor maxillary gland, but a small fold or opening of the skin of the occiput nearly at the root of each horn, (which, however, appears not to be provided with a secreting gland like these organs,) is a character peculiar to the present group, and, as already observed, may have given rise to the opinion of the ancients, that goats breathed through their ears. The form of the horns and the possession of inguinal pores are the only characters which the species included in this group possesses in common with the antelope tribes: all its other characters approximate it to the goats, as well as its habits and mode of life, and it appears in fact to form the natural link which connects these two genera. The knees are without brushes, and the females provided with two teats. There is but a single species,

48. The CHAMOIS, (*A. rupicapra*, Pallas,) the only animal of western Europe that partakes in any degree of the characters of the antelopes. The horns of this species have been sufficiently described above; they are seldom more than six or seven inches long, and are nearly parallel throughout their whole extent. The entire length of the body is about three feet three inches, that of the head to the root of the horns six inches, that of the ears four inches, of the tail three inches and a quarter, and the height at the shoulders rather better than two feet. The whole body is covered with long hair, hanging down over the sides, of a deep brown colour in winter, and brownish-fawn colour in summer, being in spring slightly mixed with grey: the head is of a very pale yellow or straw colour, with a dark brown band on each side passing from the root of the ears to the corners of the mouth, and encircling the eyes and base of the horns; the tail is short and black, and the edges of the hips and interior of the thighs and ears alone white. The face is straight as in the goat, the ears small, erect, and pointed, and the chin without a beard. In old individuals, particularly during the severe colds of winter, the cheeks, chin, and throat turn white, and the breast and belly are at all times of a light silvery brown or yellow. Underneath the external covering there is a short thick coat of fine wool, which lies close to the skin, and protects the animal from the rigours of the cold mountain regions which it inhabits. The colours of both sexes are the same, but the females are rather smaller than the males, and have horns less abruptly hooked backwards. They go five months with young, and kid in March or April, producing one or very rarely two at a birth, which they suckle till the October following. The young are at first of a uniform deep yellowish brown, with the lower jaw, sides of the head and throat white, and the same dark bands through the eyes as in the adults, only not extending so far back on the head.

The chamois, like the ibex, inhabits the loftiest chains of the primitive mountain ridges, and displays all the vivacity, restlessness and agility of the common goat. It is extremely impatient of heat, and during summer is only to be found on the tops of the highest mountains, or in deep glens where the snow lies throughout the year: in winter, however, it descends to the lower ridges, and it is then only that the hunters can pursue it with any hope of success. Its senses of sight and smell are remarkably acute; it scents a man at the distance of half a league, and displays the greatest restlessness and alarm till it obtains a sight of the object of its terror, leaping upon the highest rocks at hand in order to command a more extensive prospect, and uttering a suppressed whistle or hissing sound, being all the time in a state of the greatest agitation: but no sooner does he appear in sight than it flies with the utmost speed, scaling rocks which few other animals could attempt, and, if not intercepted by stratagem, soon leaving its pursuers far behind. The usual and most successful mode of hunting the chamois is therefore for a party of hunters to unite, and surround some mountain glen which they are previously known to frequent for the purpose of lying on the fresh snow during the day-time; towards this point the hunters advance simultaneously, and the animals, of course scenting those which come down the wind, retire in an opposite direction and are intercepted by another party. The food of the chamois consists of mountain herbs, flowers, and the tender shoots of trees and shrubs: it seldom drinks. Nothing can be more admirable than the agility with which it ascends and descends rocks apparently perpendicular. It does not descend at a single bound nor in a vertical direction, but by projecting itself obliquely or diagonally forwards, striking the face of the rock three or four times with its feet for the purpose of renewing its force, or directing it more steadily to the point it aims at; and in this manner it will descend a perpendicular rock of twenty or thirty feet in height, without the smallest projection upon which it could rest its feet. This animal is extremely partial to salt, and many stones are met with in the Alps hollowed by the continual licking of the chamois on account of the saltpetre with which they abound. The species is found in all the high mountain chains of Europe and western Asia, in the Pyrenees, the Alps, the Carpathian and Grecian mountains, the chains of Caucasus and Taurus, and perhaps in other situations.

XV. We have now arrived at a group which departs considerably in form and proportions from the symmetry and grace of the antelope tribe in general, assuming something of the weighty, solid make and massive proportions of the

[The Chamois, *A. rupicapra*.]

bovine genus, which it likewise begins to approach in its zoological characters. The horns are common to both sexes, long, erect, and annulated, straight, or with a single curvature backwards, or in one species twisted into a beautiful spiral of two or three turns; the head is terminated by a half-formed muzzle, considerably more developed than in the sheep or goat, but not so completely as in the ox or stag; there are no suborbital sinuses (except, perhaps, in one species); neither are there any knee-brushes or inguinal pores, and the females are provided with four teats. The species belonging to this division are all natives of Africa, and perhaps one may extend across the southern shores of Arabia as far as the borders of Persia, but the fact is extremely doubtful.

49. The *ADDAX* (*A. addax*, Lichtenstein) is mentioned by Pliny under the name of *strepsiceros*, which, says he, the Africans call *addax*, (or it may be, *addus*, for the accusative *adducem* is the word used in the passage referred to, and it may be derived from either of these forms in the nominative.) From the time of Pliny the only information which we had about this animal till a very recent period was derived from a figure and description of the skull and horns sent by our celebrated countryman Caius to his friend Gesner, and inserted in the great work of that early naturalist: the recent travellers, Rüppel and Hemprich, and Ehrenberg, have lately rediscovered this species, and what is singular enough, under the ancient African name ascribed to it by Pliny, the Arabs still denominating it *akasch*, *akas*, or *addas*, with the addition of the syllable *abu* (father), which they bestow upon many other animals, as *abu-Hannus* (father John) for the ibis, &c.

The length of the full grown addax is six feet from the muzzle to the root of the tail, and its height at the shoulder three feet: the horns, measured along the curves, are three feet long, the ears six inches, and the tail, with its terminating tuft, one foot. The animal is therefore about the size of a large ass, of which it has likewise much of the make and proportions, the heavy head, thick neck and legs, and switch tail. The horns are round, rather slender in proportion to their length, twisted outwards and describing two turns of a wide spiral, annulated to within five or six inches of the points, which are smooth and sharp; the form of the horns of the female does not differ from that of the male, but in the young they are almost straight. The ears are pretty long and proportionally broader than in most of the smaller antelopes, and the tail reaches almost to the hough and is terminated by a switch of long, coarse, grey hair. The whole head and neck, both above and below, are of a deep reddish-brown colour, except a transverse mark of pure white across the lower part of the forehead, between the orbits, which expands on the cheeks and half surrounds the eyes; a patch of black curly hair surrounds the root of the horns, and there is a scanty beard of the same colour on the larynx: all the rest of the animal, including the entire body from the neck backwards, as well as the legs and tail, are greyish white; the hoofs are black, and remarkably broad, to enable the animal to pass more easily over the fine and loose sands of the deserts in which it resides.

These animals live in pairs on the sandy deserts of central Africa, and appear to extend over the greater part of the continent. Hemprich and Ehrenberg found them in Dongola; and a pair of horns were brought from Bornou by Denham and Clapperton, and deposited in the British Museum. [See the article *ADDAX*.]

50. The *ABU-HARB* (*A. leucoryx*, Pallas) is, perhaps, the most celebrated of all the antelope genus, being the species which is generally supposed to have given rise to the fabulous unicorn of the antients. It is, indeed, properly speaking, the *oryx* of antient writers, but modern authors have followed the example of Pallas in bestowing that name upon a species of southern Africa with which it is impossible that the antients could have been acquainted, whilst the present species has received the name of *leucoryx*, from an epithet bestowed upon it by Alian on account of its white colour. The dimensions of this animal are very little less than those of the addax. The horns are at first directed in the plane of the forehead, and have a single gradual and moderate curvature throughout their whole course, forming, as it were, the segments of a very large circle; they are small in proportion to their great length, annulated about half way up, gradually attenuated, and very sharp at the points. The ears are long, erect, and pointed, and the tail is terminated by a very copiously furnished tuft of

long hair of a mixed black and grey colour, which reaches below the houghs. The hair on the head, body, and extremities, is universally short, and lies smoothly along the hide, except upon the ridge of the back, where it is rather longer and reversed, or turned towards the head in a direction contrary to that on the other parts of the body, and forming a short reversed mane from the middle of the back to the occiput. The head is white, with a brown mark descending perpendicularly from each orbit, and expanding over the cheek, and a similar stripe passing down the centre of the face from the horns to the muzzle; the whole neck also, on the throat as well as on the upper part, is of a uniform rusty brown colour, but, with these exceptions, all the rest of the body, as well as the legs and tail, are milk white.

This species is frequently represented on the monuments of Egypt and Nubia, and particularly in the inner chamber of the great pyramid at Memphis, where a whole group of these animals is represented, some being driven or pushed forwards, and others led by the horns or by a cord about the neck, apparently by way of tribute from some subject or conquered nation. With one exception, these representations are invariably in profile, so that only one horn is seen. The present species is gregarious, and lives in large herds in Sennaar and Kordofan, feeding principally upon different species of acacias.

[The Algazel, *A. gazella*.]

51. The *ALGAZEL*, (*A. gazella*, Pallas,) described and figured first by Prosper Alpinus, and more recently by M. F. Cuvier, is so nearly related to the last species, that we should have no hesitation in considering it as absolutely the same, did not this eminent zoologist expressly inform us that his algazel was furnished with lachrymal sinuses, which certainly no other species of the present group possesses. The specimen described by M. Cuvier was sent from Senegal, and lived for some time in the menagerie of the Jardin des Plantes. As this is at present the most obscure species of the group, we have copied the engraving of M. Cuvier, to give the reader the opportunity of comparing it with the beautiful engravings of the former species published in the works of Lichtenstein, Rüppel and Hemprich, and Ehrenberg. Though the specimen described by M. Cuvier was obtained from Senegal, we are assured that the animal is unknown, or at least very rare, in that country, and only brought occasionally from a distant part of the interior.

52. The *GEMSHOK* (*A. oryx*, Pallas) is in all respects a very distinct and marked species. It is a heavy, stout animal, about five feet in length, and three feet two inches high at the shoulder: the length of the horns is from two feet to two and a half, that of the ears seven inches, and that of the tail thirteen or fourteen. The horns are almost perfectly straight, very little divergent, and situated in the plane of the forehead; they are obscurely annulated for half their length, black, and blunt in the male, but very sharp pointed in the female. The ears are large and pointed, and the tail pretty uniformly covered with long black hair, forming

a large switch. The general colour of the body is dark rusty-iron grey on the upper parts, and white on the under, the two being separated on the flanks by a broad longitudinal band of dark brown or black; and the hair of the back and neck reversed, as in the two species last described. The head is white, marked with two transverse bands of deep black, rising from the root of the horns and passing down the face, then encircling the eye, and uniting under the lower jaw with those of the opposite side. From this point, a black band passes down the throat upon the chest, where it divides into four, one pair of which pass along the flanks and divide the colours of the upper and under parts of the body, the other pair encircle the fore-arms; the thighs are likewise black, whilst all the rest of the limbs is white, except a black mark on the canons. On the upper surface, the black line passes down the neck and back, and expands into a broad disk on the rump. These colours are all boldly separated from one another, and the harshness of their contrast produces a very singular effect upon the appearance of this animal.

The oryx inhabits the karroos of South Africa: it is never found in the woods, but keeps on the open plains, and lives in pairs or small families of four or five individuals. It is extremely dangerous to approach when wounded, if not completely disabled, making vigorous use of its long powerful horns, and it is said being not unfrequently the first to commence the assault. We are even assured that the lion himself is afraid to attack this powerful and courageous animal, and that sometimes, when pressed by famine he has ventured to do so, he has been beaten off with disgrace, or even paid for his temerity with his life.

XVI. The sixteenth group differs from that which we have just described by having the muzzle more completely formed, but in all other respects the characters are precisely the same, at least as far as they are known. There are neither lachrymal sinuses, inguinal pores, nor knee brushes; the characters of the females, however, have not been observed, but it is most probable that they are provided with horns like the males, and have four teats. The horns themselves are round, annulated, and uniformly bent backwards; or in one species forwards; and there is, as in most of the species of the former division, a reversed mane on the shoulders and neck. These animals are confined to Africa, and, as far as we are at present aware, to the southern portion of it, yet seldom, if ever, passing the Orange River, and absolutely unknown in the neighbourhood of the Cape.

[The Blauwbok, *A. leucophaea*.]

53. The BLAUWBOK (*A. leucophaea*, Pallas) was formerly an occasional visitor in the district of Zwillingdam, but has not been seen within the boundaries of the colony for the last thirty years. It is six feet in length, and three feet seven inches high at the shoulder: the head is nine inches long from the muzzle to the base of the horns; these are two feet two inches, measured along the curves; the length of the ears is eight inches, and that of the tail, with its terminating tuft, one foot. The horns are round, uniformly curved backwards, and marked with from twenty to thirty

prominent and complete rings, the last six inches being smooth, and the points very fine and sharp. The hide of this animal is perfectly black, and it is this colour reflected through the ashy-grey hair that communicates the dark blue shade which has given rise to the name of *Blauwbok*, or *Bluebuck*, by which it has long been known among the Dutch at the Cape of Good Hope.

The blauwbok lives in pairs or small families of five or six individuals on the open plains of South Africa, north of the Gareip or Orange River. It is dangerous when wounded, and during the rutting season in particular is said to attack indiscriminately every animal that comes in its way.

54. The TAKHAITZE, (*A. barbata*, H. Smith,) beautifully figured by Mr. Daniell in the *African Scenery*, is a species which appears to differ from the blauwbok only by its long flowing mane, copious beard, and superior size. This animal inhabits the country in the vicinity of Latakoo, and is called *Takhaitze* by the Booshuanas. It is said to be so wild and ferocious that the natives are afraid to attack it openly with the *hassagai* or spear, as they do other game, but do take it generally in pitfalls covered over with sticks and earth. It is commonly found in pairs upon the open plains, but when disturbed makes for the wooded heights, which are thickly covered with the common mimosa, upon which both this animal and the giraffe delight to feed. The name takhaitze signifies a fierce or wicked beast, and expresses the dread with which the resolution and prowess of this powerful animal inspire the Booshuanas, who seldom venture to approach it openly.

55. The EQUINE ANTELOPE (*A. equina*, Geoffroy) is a large species which measures seven feet and a half in length, and four feet in height at the shoulder. The horns are much larger and heavier in proportion to their length than those of the blauwbok; they are, however, much of the same general form. This species, of which the native name has not been recorded, inhabits the same localities as the last two, living like them in pairs or small families on the elevated plains and low wooded hills of South Africa. It is abundant about the sources of the Gareip, and was found by Mr. Burchell in the vicinity of Latakoo.

56. (*A. Ellipsiprymnus*, Ogilby.) A description of this new species lately appeared in the *Proceedings of the Zoological Society*. The whole length of the animal from the muzzle to the root of the tail was seven feet three inches and a half; its height at the shoulder nearly four feet, and to the top of the horn upwards of seven feet; the horns measured thirty inches upon the curves, the ears were upwards of eight inches long, and the tail, with its terminal tuft, one foot nine. The horns are very thick and heavy; they spread widely outwards, are nearly straight for the first half of their length, and then turn forwards with a gradual and uniform curvature. They are surrounded with twenty-four prominent annuli, forming large knobs in front and deeply striated between, but nearly obliterated behind: the last six inches are smooth, and the points blunt. Next to the character of the horns, this species is most readily to be distinguished by a ribbon of pure white, which passes over the croup and down each hip, uniting between the thighs and forming a perfect ellipse, having the root of the tail in one of its foci, and contrasting most singularly with the dark rusty-iron grey of the surrounding parts. It is to this mark, which is so peculiarly characteristic of the species, that the name of *Ellipsiprymnus* refers; the native name of the animal is unknown.

The specimen from which this description was taken was brought to this country by Mr. Steedman, and exhibited with a fine collection of South African zoology at the Colosseum in the Regent's Park. It had been procured from a tribe of the Damaras, a nation who inhabit the country beyond the Great Namaqualand, and about twenty-five days' journey north of the Orange River. They described it as fierce and dangerous to approach.

XVII. The seventeenth section or subdivision of antelopes has all the characters of the group last described, except the horns, which are either of a spiral form themselves, or else surrounded by a prominent spiral wreath throughout the greater part of their length. They are common to both sexes, very large and heavy in the males, but longer and more slender in the females. These animals are without either lachrymal sinuses, inguinal pores or brushes on the knees; they have naked muzzles, large hanging dewlaps, and the females are provided with four teats forming a small udder. The group contains two species, both natives of South Africa.

[The Canna, *A. orcas*.]

57. The CANNA, (*A. orcas*, Pallas,) improperly called *eland* or *elk* by the Dutch colonists of South Africa, and *impoof* by the Caffres, is considerably the largest of all the antelopes, being the size of a good horse, and measuring eight feet two inches in length and full five feet in height at the shoulder. The horns of the male are a foot and a half in length, very thick and heavy, almost straight till within three inches of the tips, where they bend outwards, attenuated at the points, and surrounded throughout the greater part of their length with a thick spiral wreath, which passes twice completely round them, and finishes by becoming indistinct near the points. Those of the females are longer and smaller, and the spiral wreath is, in some specimens at least, scarcely to be seen. The head is long and pointed, the ears are large, the neck thick, compressed on the sides, as in the ox, and furnished underneath with a loose hanging skin or dewlap, fringed along the margin with a border of long hair. There is likewise a large protuberance of the size of a man's fist on the larynx, and it was probably from this organ, which is likewise found in the elk of Europe, that the animal derived the name of *eland*, by which it is universally known at the Cape. From the centre of the forehead to the root of the tail, runs a short, erect mane of dark brown hair, which is reversed on the neck, but directed backwards, in the usual manner, along the spine of the back. The length of the spinous processes of the interseapular vertebrae produces a considerable and sufficiently remarkable elevation of the shoulders; but there is no actual hump, as in the camel or Indian ox, though at first sight such a formation might be supposed to exist. The tail is upwards of two feet long, and terminated by a tuft of long black hair. The colour of the body is uniform reddish-fawn on the upper parts, and white on the under; the head and neck ashy-grey, but in some individuals the latter colour extends over all the upper parts of the body.

The canna is a large heavy animal, which, when full grown, weighs from seven to nine hundred weight, and contrary to the usual rule observed among antelopes, is commonly extremely fat. Its flesh is, consequently, more prized than that of any other wild animal of South Africa, and the large muscles of the thighs, in particular, are held in the highest estimation when dried and cured, under which form they are denominated thigh-tongues. The character of this animal is very mild, and, as it were, predisposed to domestication; it is gregarious, and lives in large herds upon the open plains and low hills, the old males generally residing apart. Elands were formerly very common in the immediate neighbourhood of Cape Town, but were so much hunted, that they have long since ceased to frequent the inhabited districts, and are now rarely met with except in the most distant and retired parts of the colony. Being generally very fat and puffy, they do not run well, and are soon fatigued; it is even said that when hard run, a red oily perspiration has been known to ooze out from the pores of their skin, and that they occasionally drop down from plethora. Like most other animals when hunted, they always run against the wind. As the carcass is weighty and consequently difficult to transport, the great object of the hunters, in the chase of the canna,

is to turn their game in such a direction as to drive it close to their own residence before killing it; and, in fact, the Cape farmers, from long practice and intimate knowledge of the animal's habits, very frequently succeed in accomplishing this masterpiece of South African field-sports. They are so gentle that a man on horseback may penetrate into the very middle of a herd, without alarming them, and pick out the fattest and best-conditioned, and as the old bulls are commonly chosen on account of their greater size and weight, it not unfrequently happens that the herd is left altogether without a male.

58. (*A. canna*, H. Smith.) This is a species of which Colonel Smith has given a description, and which he supposes to be the *baustard* eland of the Cape colonists. Col. Smith is the only naturalist who has seen the skin of this animal: its horns and skull are found in several museums.

This species is said to be common in the Great Desert north of the Gariep, and to be occasionally seen on the Karroos of the southern bank. It lives in large herds.

XVIII. The eighteenth section contains a single species, distinguished by its short upright horns slightly bent backwards, common to both sexes, with a few transverse annuli at the base, and marked by deep longitudinal striae almost to their extremities. The species is without either lachrymal sinuses, inguinal pores, or knee-brushes, but it has a complete naked muzzle, and the female is furnished with four teats. As the former division seemed to unite the antelopes with the oxen, so this seems to be intermediate between them and the goats, being about the same size as these latter animals and inhabiting similar localities. The only known species is

59. The GORAL, (*A. goral*, Hardwicke.) first described by General Hardwicke in the *Linnean Transactions*.

The goral inhabits the kingdom of Nepaul, and lives in large herds upon the elevated plains which crown the lower ridges of the great chain of the Himalayan mountains. It is wild and fleet, and when pursued flies to the rocky hills, where it easily escapes the hunter, and is indeed rarely taken except by stratagem. Its flesh is considered excellent venison. It is entirely confined to the cold upper regions of Nepaul, and is incapable of bearing the sultry heat of the plains of Hindustan.

XIX. The nineteenth group contains a single species like the goral, a native of Nepaul and upper India, but differing from all those which we have lately been discussing by the development of large suborbital sinuses, which shows a return to the characters of the common antelopes. The horns are common to both sexes; short, parallel, slightly curved backwards as in the goral, and traversed throughout the greater part of their length with longitudinal striae, crossed by transverse depressions, and thus marking the whole surface of the horns with alternate rows of small pits and little pearly excrescences: the points only being smooth and sharp. Besides these characters, the present section is distinguished by a complete naked muzzle, four teats in the females, and neither inguinal pores nor knee-brushes.

60. The THAR (*A. thar*, Hodgson) was described for the first time in a paper by B. H. Hodgson, Esq., British resident in Nepaul, read before the Zoological Society, and printed in the second part of the *Proceedings* of that body.

The thar inhabits the central region of Nepaul, at an equal distance from the snows of the Himalayan range on the one hand, and the sultry heats of the low plains of India on the other. It is the most common of all the wild ruminants which are found in that country, and its chase is the favourite exercise and amusement of the hill tribes; its flesh is, indeed, coarse, but there is plenty of it,—and these rude people are easily satisfied on the score of quality, provided the quantity be sufficient. Its habits are wild and solitary; it is seldom found in herds, however small, and the grown males especially live apart in the mountains, and never seek the society of their species except during the rutting season. As might be supposed from its heavy make and short stout limbs, it is a slow runner, and soon brought to bay, but it leaps well, and makes its way over broken ground with greater ease than in open level situations. It is found from the eastern confines of Nepaul to the banks of the Sutledge, but abounds especially towards the east.

XX. We are now arrived at a group of antelopes of which two species at least are well known, and one has been celebrated under the name of *bubulus* from the most remote periods of Grecian and Roman literature. This group is distinguished by having heavy, thick, annulated horns, at

first inclining slightly forwards, and then suddenly bent backwards, so as to form a prominent angle or shoulder in front. The muzzles are small and not so completely developed as in some of the other groups; the lachrymal sinuses are also small, and instead of opening by a fold in the skin, consist simply of a small gland on its surface, almost concealed by the surrounding hair, and only to be distinguished by the viscous matter which exudes from them. The character of the inguinal pores has not been observed, but the species are without scapæ, and the females are provided with horns and have only two teats. The species is spread over the whole continent of Africa, and lives in large herds on the open plains and karroos.

[The Beker-el-Wash, *A. bubalus*.]

61. The BEKER-EL-WASH (*A. bubalus*, Pallas) is about the size of the largest stags, and is particularly remarkable for the great length of its head, and its narrow, flat, and straight forehead and face.

This animal, called *Beker-el-Wash*, or wild ox, by the Arabs, is common in every part of northern Africa, living in numerous herds on the confines of the Tell or cultivated parts, and the Sahara or Desert, and also, according to Captain Lyon, upon the mountains south of Tripoli. Barbary seems to be the chief habitat of the species, but it sometimes happens that a few individuals find their way across the Desert to the banks of the Nile, where, however, they are seldom seen, and, as it is said, only when they stray from their native habitat. At the same time it is to be observed, that its representation occurs among the hieroglyphics of the temples of Upper Egypt. Dr. Shaw informs us, that the bubalus is naturally of a familiar disposition, and that the young calves frequently mix with domestic cattle, and soon learn to attach themselves to the herd without attempting to escape afterwards. They fight like the common bull, by lowering the head, and striking suddenly upwards with the horns, which are formidable weapons either for attack or defence.

62. The CAAMA (*A. caama*, Cuvier) is a species of South Africa, nearly allied to the beker-el-wash, and long confounded with it.

The caama, called *Hartebeest* by the Dutch farmers, inhabits the plains of South Africa, and is the most common of all the large antelopes in that country. It resides in large herds, and is a favourite object of pursuit with the natives and colonists. Its pace, when at full speed, resembles a heavy gallop, but is tolerably quick notwithstanding; and the animal has a habit of frequently stopping to gaze at its pursuers when it has got to any distance ahead of them. Its manners are sufficiently mild and tractable, but when put upon its defence it makes good use of its powerful horns, dropping on its knees before charging, and after advancing some distance in this position, darting suddenly forwards with great force against its adversary. The flesh is rather dry, but of a fine grain, more nearly resembling the beef of the ox than that of any other antelope, except perhaps the caama, and it has a high game flavour which makes it universally esteemed. The female produces but a single calf,

which she brings forth in September or April, and which, if taken young, is easily domesticated.

63. The SASSABY (*A. lunata*, Burchell) is a species at present very imperfectly known. It is found in the Booshwana country, where, however, it would appear that the species is rare, as Mr. Burchell, the only traveller except Daniell that mentions it, met with but a single specimen. In many respects the descriptions of Burchell, and of Colonel Hamilton Smith, who also has given one, are both imperfect, but the drawing of Daniell, in his *Sketches of African Scenery and Animals*, supplies most of their omissions, and clearly shows at least that the animal belongs to the present division, if it does not supply the more minute details. The meat of the specimen shot by Mr. Burchell was tender and well tasted, and the name of *Kaama*, which his attendants bestowed upon the animal, shows that they consider it as a kindred species with the Hartebeest of the colonists, the *Antelope caama* of the last article. The Booshwanas call it Sassaby.

XXI. We are now arrived at the last and perhaps the most extraordinary of the small groups into which we have found it convenient to subdivide the extensive genus of antelope. The distinguishing characters of this group are found in the horns, which are common to both sexes, and which, after first expanding over the whole upper part of the skull and forehead, like a broad helmet of bone, curve downwards between the eyes, and then suddenly turn upwards, becoming round and attenuated as they advance, and ending in moderately sharp points. They have no annuli, but are rough and scabrous at the roots, and smooth toward the points. The head is heavy like that of the ox, and terminated by a very broad muzzle, which expands on each side into a thick muscular flap, which fits into each nostril, and covers it like a lid or valve. The lachrymal sinus, as in the last section, consists of an external gland, which is placed below the anterior angle of the orbit, and concealed in a tuft of long feathering hair which entirely surrounds it. There are neither inguinal pores nor brushes on the knees; the females are provided with two mammae. There are three distinct species belonging to this group, one of which is generally supposed to be the *Katoblepas* (*κατόβλεψ*) of the ancients. (Plin. *Hist. Nat.* viii. 21.) The singularity of their forms renders them very remarkable; the head and horns are those of an ox or buffalo, the tail, neck, and mane resemble those of the horse, and the body and limbs have the light taper form and round contour that distinguish those of the stag. The whole three species inhabit the open plains of South Africa to an unknown distance in the interior. They live together and form extensive herds.

[The Gnu, *A. gnu*.]

64. The GNU (*A. gnu*, Gmelin) is about the size of a well-grown ass. The neck, body, and tail precisely resemble those of a small horse, and the pace also, which is a species of light gallop, is so perfectly similar, that a herd of gnus, when seen at a distance flying over the plains of South Africa, might be readily mistaken for a flock of the wild

zebras or quaggas which inhabit the same localities, if their dark and uniform colour did not distinguish them.

The gnus live in extensive herds on the karroos of South Africa; they are naturally wild and difficult of approach, and when wounded will turn upon the hunter and pursue him in turn, dropping on their knees before making an attack, and then darting forwards with amazing force and velocity. When first alarmed they commence by flinging up their heels and capering like a restive horse, tossing their heads and tails, and butting at the mole-hills or other objects, but immediately after taking to flight, and traversing the desert with a speed which soon carries them beyond the reach of danger. They do not run in a confused crowd like sheep or oxen, but in single file following a leader, and have a pleasing appearance as they skim over the level plains. They are said to be subject to a cutaneous eruption at particular seasons of the year, which they sometimes communicate to domestic cattle, and which invariably ends in death.

65. The Kokoon (*A. taurina*, Burchell) is of a larger size than the gnu, to which, however, it is very similar in its external form and proportions.

The habits and manners of the kokoon closely resemble those of the gnu, but it possesses neither the speed, spirit, nor activity of that animal. It is sometimes found solitary, but more frequently in large herds, and inhabits the open plains and karroos in the country of the Tambookies and Booshranas; it never associates with the gnu, which frequents the same localities, at least about Latakoo, but which it appears to replace along the eastern coast of South Africa, as the following species seems to do along the western. The species has been observed in the situations here mentioned by Professor Lichtenstein, Messrs. Truter and Somerville, Burchell and Thompson. Kokoon is its Booshrana name.

66. The BRINDLED GNU, (*A. gorgon*, Hamilton Smith), a very distinct species from the two last described, is however known only from a specimen in the Museum of the London Missionary Society, which was brought from South Africa, and most probably from the country of the Namaquas or Damaras who inhabit the western coasts about the mouth of the Gareip, or Orange River.

Colonel Smith supposes, with great probability, that this species is the *Baas*, not, however, of the Namaquas as he states, but of the Dutch Boors of South Africa, who are in the habit of making occasional excursions into the Namaqua country, and in whose language the word signifies *master*, and most probably refers to the bold and resolute character of the animal. It appears to be the variety of gnu mentioned by Le Vaillant in his *Second Voyage*.

In the preceding enumeration of the species belonging to the extensive genus *Antelope*, as it is at present constituted, we have carefully avoided the multiplication of fictitious species, by rejecting all those of which the authenticity is in any degree doubtful. Our list of species will, therefore, be found to differ in many instances from those contained in general catalogues, but it is hoped that it will, at the same time, be found to contain all that is really certain in the present state of the science. Those who desire to pursue the subject further, must consult the professed treatises on mammology, and the various detached notices scattered through the works of the different Asiatic and African travellers.*

ANTENNÆ, horn-like members placed on the head, and peculiar to insects and crustaceous animals; their functions are not well understood, and have given rise to several very different opinions among naturalists. The term is derived from the Latin *ante*, 'before,' and was applied by the Romans to the sail-yard of a ship. In insects, they are uniformly two in number; but in crabs and lobsters there are more than two. They are connected with the head always near the eyes by means of a ball (*bulbus*) and socket (*torulus*). They are composed of minute cylinders or rings successively added to each other, to the number of thirty in some butterflies; and thus forming a tube which incloses

nerves for sensation, muscles for moving, as well as air-pipes and cells, all of which are figured with minute precision by M. Straus-Dürckheim, in his splendid work *On the Anatomy of the Cockchafer*, published at the expense of the Institute of Paris.

The form of the antennæ is exceedingly various, some being simple and some feathered, clubbed, comb-shaped, in endless diversity. In moths, the female is distinguished from the male by the antennæ being more simple. In some moths and beetles the antennæ are very long compared with the length of the body, whereas in the house-fly, and some other two-winged flies, they are very short. Their length does not depend on the number of joints, for they may be long when composed of only three or four pieces, and short when composed of ten or more pieces.

With respect to the functions of the antennæ, it is the most common opinion that they are organs of touch, and are, on that account, often termed feelers: 'but,' as M. Straus-Dürckheim justly remarks, 'this conjecture is founded upon facts imperfectly investigated, if not altogether false. I have made numerous researches on this subject, and I have never been able to satisfy myself that insects examine objects by feeling them with their antennæ. On the contrary, I have rarely observed these animals touch anything with these organs, and when this did happen, it appeared to be only by accident, and not at all from design. Many insects, besides, have their antennæ so short, that they would be obliged to stand erect upon their heads in order to come at the bodies which they might thus wish to explore, and for this their feet are certainly much better adapted.'

'Since,' continues M. Straus-Dürckheim, 'almost all articulated animals possessing a solid skin (*peau*) have antennæ, which are furnished with nerves of an extraordinary thickness in proportion to their own size, there cannot remain a doubt that they are organs of some sense, and that too a very acute one.'

'I have said that insects are proved, by observation, to be furnished with an organ of hearing. It is, indeed, scarcely probable that creatures, such as the tree-hopper (*cicada*) and the locust (*locusta*), to which nature has given the faculty of producing a peculiar sound by means of an appropriate organ, should, at the same time, be deprived of the means of hearing such sounds, inasmuch as these can have reference only to their own kindred. It is still further proved that these insects share the faculty of hearing along with all other living beings, by their ceasing to sing the instant they fear they have been discovered.'

'When observing the various actions of insects we see them suddenly stretch their antennæ forwards in case of noise, danger, or, in general, when anything is done to attract their attention: and they keep them thus stretched forward as long as their attention continues, a circumstance which proves that the antennæ serve the purpose of apprising them of what passes at a distance, and consequently must either be organs of hearing or organs of smell. M. Réaumur, (*Mém. des Insectes*, i. 613,) while he rejects the opinion that the antennæ serve to explore objects, thinks it possible they may be the organs of some unknown sense, or of smell. The latter opinion, however, is supported by no fact either anatomical or physiological; nor is it at all even probable, inasmuch as the antennæ are not soft and lubricated, as observation proves to be necessary for this kind of sensation; it appears to me more plausible to infer that the antennæ serve for the perception of sounds. This opinion is founded partly on the analogy of what occurs in the larger animals, who prick up their ears under similar circumstances in order to hear better; and partly on comparison of the organs of hearing in the first of the vertebrate animals (*vertebrata*), and the antennæ of articulated animals, where we observe a sort of transition occurring in the lobster and cray-fish (*astacus*), a genus in which this organ occurs in the simplest form, compared with that of superior animals.'

'The solidity of the envelope of antennæ renders these organs well adapted to undergo the same vibrations as the air, in the same manner as the strings of an Æolian harp vibrate and emit various sounds according as they are differently struck by the air. In this view, however, we might infer that nature would have made antennæ in the form of rods, consisting of a single piece, in order that they might be more susceptible of vibrations; but it ought to be considered, that these organs would, by such a conformation, have been much exposed to breaking, while, in consequence of their jointed form, they have the advantage of regulating

* The length to which this article has extended requires some explanation. The genus *Antelope*, embracing a great variety of species, has presented difficulties to naturalists in its many subdivisions into groups; and one species has frequently been confounded with another. A complete and connected view appeared, therefore, desirable to be here attempted. According to our usual plan, we should have described the species under their respective heads; but this would have prevented that comprehensive arrangement which the writer has here aimed at. We insert this note to prevent an impression that the same principle will be carried into other zoological articles.

the degree of vibration at pleasure, as may indeed be observed when insects listen with attention; I mean, that the joints of the antennæ perform the same functions as the chain of small bones in the chamber of the human ear, inasmuch as they form a similar chain, and transmit the vibrations of the air to the auditory pulp.

Professor Bonstorff of Abo in Finland came to embrace a similar opinion from his own observations, in opposition to those of Linnaeus and Bergmann with whom he was contemporary. His paper on the subject is long and desultory, but the following passage is worth quoting. 'No evidence more clear,' he says, 'could be desired of the sensibility of the antennæ to quick sounds, than what occurred to me last summer in my garden. I observed in a morning walk, undertaken for the purpose of catching insects on the hazels, that while standing in the shade a nut weevil was sitting quietly at a distance upon a leaf, with the antennæ hanging down as if they were asleep, on which account I directed a pocket telescope to the spot, which was above five feet distant, and therefore convenient for viewing the insect. The point of view being thus determined, I made a loud sound, and I was delighted with the opportunity of seeing the weevil not only roused, but the antennæ which had been hanging down became elongated, and, being full of joints, struck by the undulations of sound they extended themselves and remained on the alert till alarmed again by a fresh sound. All my observations agreed in this one circumstance of the antennæ being erect as soon as they were put on the alert; they were moved hither and thither by means of loud sounds, but they disregarded such as were very small. These they may be said to have drunk in; and if alarmed by new sounds they rejoiced when they could effect their escape as soon as possible, and preserve life and safety by the most rapid flight. So I have observed very frequently when the antennæ were folded up in the *Leptura*, *Elateres*, *Curculiones*, *Papiliones*, and *Apes*; nay, even the house-flies, as soon as they were moved and excited by irregular sounds or noise, would erect their antennæ and betake themselves to flight without any other excitement.'

We have deemed it best to give the very words of these able naturalists upon a point which is doubtful, or at least obscure. Some additional experiments and arguments illustrative of the same view are given in the volume on *Insect Miscellanies*, chap. iv. in the *Library of Entertaining Knowledge*.

There is one other subject connected with the antennæ which requires notice:—the younger Huber has attributed to ants the use of certain signs made with these organs, which he terms antennal language, understood not only among ants themselves, but also among the aphides, on which they depend for the excretion popularly termed honey-dew. The motions of the antennæ, however, to which he refers in proof of his views, do not, so far as we can judge, authorize us to conclude that they are used in the way of language, any more than to theorize in the same way upon the bills of nestling birds which are opened to receive food, or their wings which are opened and vibrated rapidly while they receive it. That there is nothing peculiar in this alleged antennal language, so far as the aphides are concerned, any one who chooses may prove by taking a pin or a camel-hair pencil and gently touching the aphids, when it will eject the honey-dew as readily as in consequence of being touched with the antennæ of an ant. This we deem to be quite fatal to M. Huber's conclusions.

ANTEPAGMENTA. This is an antient term for the jambs of a door, or, as they are familiarly termed, the door-posts.

ANTEQUERA, ANTIKARIA, a town of Andalusia, in the province of Malaga. The old town is built on a hill, but the new one stands in a plain surrounded by mountains. Its vega (plain) is one of the richest in the province, owing to its being irrigated by the two rivers Guadalhorce or Gundalorce, and Lavilla, and produces all sorts of grain, fruit, wine, and oil. The neighbouring mountains abound in fine wood, white, black, and red marble, limestone, and gypsum. About eight miles north-west of the town is a lake of salt-water, four miles in length and a mile in breadth, which, in the summer months, from the watery particles being evaporated, becomes a solid mass of salt.

Seven miles south of Antequera is the Sierra del Torcal, a mountain elevated 4219 feet above the sea, and consisting principally of marble and limestone. The sandstone which united the rocks being now decomposed, the assemblage of

rocks remaining presents the most singular appearance. At a certain distance they assume the forms of houses, temples, and even figures of men and animals. The order of their arrangement is such that they form streets, lanes, and squares, and indeed, such is the illusion produced to the eye, that one might almost be tempted to believe the old Moorish story, that it was once a populous town, miraculously converted into stone. Travellers ought to be aware how they venture into this intricate labyrinth without a proper guide, as they run the risk of never finding their way out of it again. The spaces left between the rocks form as many natural meadows, in which are fed numerous herds of bullocks, sheep, and goats.

The Roman municipium Singilis was situated about four miles north of Antequera, and another Roman town, Nescania, stood eight miles westward, on the spot where now is a village called Fuente de la Piedra, (the stone fountain,) on account of a fountain springing there, the water of which is said to possess the property of curing the gravel. Several Roman inscriptions bearing the names of both these towns, as well as of Antikaria, have been preserved in the stones of the *Arco de los Gigantes*, or arch of the giants, built in 1585, at the entrance of the old city.

Antequera was conquered from the Moors in September, 1410, by the Infante Don Fernando, who was afterwards king of Aragon. King Juan II. gave it back afterwards to the kings of Granada; but the inhabitants refusing to submit, headed by their gallant alcaide, Rodrigo de Narvaez, boldly defended their independence, and compelled the Moors, who besieged them twice, to abandon the place. This is the origin of the motto '*Antequera por su amor*,' 'Antequera for its sake,' which is on the arms of this city.

The manufactures of the inhabitants consist of common woollen stuffs, silk, leather, paper, and soap. The population amounts to 22,732 souls. There are at Antequera, a collegiate church with twelve canons, four parish churches, eleven convents of monks, eight of nuns, an ecclesiastical seminary, an hospital, and an almshouse.

Antequera is in 37° 9' N. lat., 4° 32' W. long.

See Miñano: *Ponz*, *carta* iv., n. 50 to the end, tom. xviii.

ANTHELMINTICS, from two Greek words, signifying means used to expel worms from the intestinal canal, and to prevent their formation. Though the origin of worms in the intestines has been a subject of enquiry and controversy for many ages, we are far from having arrived at a satisfactory conclusion respecting it. While some have regarded them as the result of what is termed *spontaneous* or *equivocal generation* occurring in the intestines, (see *Aristot. Hist. Anim.* v. 19.) others have maintained that they are introduced into the stomach from without, either along with our food, or in some other way, in so small a form as to be unobserved. Great difficulties attend either view of the question. If it is held that they come from without, the sources of them have never been seen, and cannot be pointed out. The opinion of their spontaneous generation is also rendered very improbable, both by the consideration that such an occurrence would be at variance with the present universal mode of production of all other animals, which invariably issue from parents similar to themselves, and by the fact that, however the worms may be at first produced, when once developed in the intestines, they are propagated like other animals of the same grade in the scale of organization, viz. by parents of distinct sexes; and the *ova* or *eggs* which the female produces are both to be seen in the oviducts, (see fig. 1. a.) before they escape, and also are to be found among the contents of the intestines previous to their development as perfect worms. The settlement of this question would be interesting, and might prove useful in directing us in our prophylactic treatment. But as we cannot pretend to this in the present state of our knowledge, we must refrain from further discussion of the subject, and rather enquire into the circumstances and conditions favourable to their development and the means of counteracting them.

The causes of worms, and of the tendency to their formation, may be divided into, 1. general and local, referring to the residence, and, 2. special, referring to the individual infested by them, his constitution, habits, diet, &c.

Of the first division, the most general is climate. In certain countries worms prevail more than in others; and hence their frequency in Holland, where there is no want of personal cleanliness, or attention to the food; but the constant moisture of the atmosphere, both producing general weak

ness, and acting hurtfully on the skin,—the state of which, owing to the sympathy existing between it and the digestive organs, influences greatly the health of the body,—farther predisposes to their development. We see the same causes operate in producing the rot in sheep, which is always accompanied by the presence of a worm (the *Distoma hepaticum* or *fluke*) in the liver; and we shall find the same means prove successful in preventing their formation in both cases: as only sheep feeding in wet pastures, such as marshes, are subject to the rot.

Dwelling in an impure air, where there is not sufficient ventilation, prepares the body for becoming the seat of worms, and hence their greater frequency among the crowded inhabitants of towns than among the peasantry.

The effect of these general causes is to produce a weak state of the system, the existence of which, however occasioned, seems the first requisite for the development of worms. When in addition to these there are other causes which operate only on individuals, we perceive the reason why one person becomes subject to worms, from which another person continues exempt. This naturally conduces to the second set of causes, connected with the individual affected by these parasites. These we shall find to be a constitution, either hereditarily weak, or debilitated by sedentary occupations and improper diet. Accordingly, those most subject to worms are females and children, especially of a scrupulous habit. In these last there exists very commonly weakness of the digestive organs, along with an immoderate craving for food, which injudicious parents and nurses are too apt to indulge—regarding it as the sign of a good appetite—by which more aliment is introduced into the stomach than it can conveniently digest, and consequently the stomach and bowels become clogged, both by the undigested matters remaining in them, and also by the unhealthy secretions, which, under such circumstances, are invariably poured into them. The articles given to satisfy this craving, which generally shows itself between meals, are almost always those which experience has shown to be the most calculated to favour the production of worms, viz., articles of too farinaceous a kind, as biscuits, cakes of different sorts, or bread and butter, or cheese: for milk, and the preparations of it, which we have just mentioned, seem to dispose to the formation of worms more decidedly than anything else.

The presence of worms in the intestines cannot always be determined by any one, or even by the concurrence of many symptoms, for enormous tennias (*tape-worms*) have sometimes been passed, of the existence of which not the least suspicion was entertained by the individual; nor was any derangement of the health observable. But we are justified in suspecting them to be present where the appearance and expression of the countenances are much altered from the natural state; when it is of a pale, somewhat leaden, hue, subject to sudden flushings, often limited to one side of the face, where the eyes have lost their brightness, the pupil is enlarged, and the lower eye-lid surrounded by a livid circle. In addition to these symptoms, the nose is often swollen, and affected by an intolerable itching, or frequently bleeding; there are pains in the head, with ringing of the ears; the tongue is coated, and the breath disagreeable. The appetite is very variable, sometimes there is none, at other times it is ravenous: there is often a feeling of sickness and a disposition to vomit; occasionally there are violent cholics, the bowels irregular, seldom costive, more frequently loose; the stools slimy, sometimes tinged with blood; the belly swollen and hard, while there is generally a wasting of the rest of the body; the urine is rarely clear, often of a milky appearance. The sleep is disturbed, and the child grinds the teeth; during the day, it is indolent, and very variable in temper.

It is necessary to be thus minute in stating the symptoms of worms, as, sometimes on very slight grounds, individuals have been subjected to a long and severe course of treatment for worms, when none existed; while, too often, they are allowed to commit their ravages unmolested, and to plunge the unhappy victim into a state of great misery and suffering, and even to lead to a fatal termination. We are not willing to attach full credit to all the horrible consequences attributed to worms, but that they often produce many serious diseases, and aggravate others, is certain.

The number of different kinds of worms infesting the stomach or intestines of man is not very great, but they propagate their species often with astonishing rapidity. We

shall enumerate the most common sorts, following the nomenclature of Bremser, (*Lebende Würmer in lebenden Menschen*. Wien, 1819; also translated into French, by Dr. Grunbler, Paris, 1828. *Traité des Vers Intestinaux*).

The *Trichocephalus dispar*, (or *long thread-worm*), found in the upper part of the large intestines (or *Cæcum*); *Oxyuris vermicularis*, (*Ascaris vermicularis*, the *maw*, or *thread worm*), which inhabits the rectum, or lowest intestine; *Ascaris lumbricoides*, (the large round worm,) mostly found in the small intestines; *Bothriocephalus latus*, (*Tenia lata*, the *broad tape-worm*), found in the small intestines, (principally of the inhabitants of Russia, Poland, and Switzerland, seldom met with in Britain;) *Tenia solium*, (the *tape-worm*), in the small intestines, generally alone, but occasionally three or four together: the *Distoma hepaticum*, (or *fluke*), is sometimes found in the liver and gall-bladder of man, but more commonly of sheep, goats, &c.

The worms which are occasionally found in other parts of the body are not under the influence of the medicines termed *anthelmintics*, and we therefore leave them unnoticed here.

To assist us in distinguishing the particular kind of worm present in the intestinal canal, and to regulate thereby our treatment, it is proper to mention that the maw, or thread worm, and large round worm, are most common in youth, and the tape-worm in adult age.

From what has been said above, the principles of treatment may readily be deduced: these are, to strengthen the individual, and weaken the worms, which facilitates their expulsion, and diminishes the tendency to their formation. This last is a point of great practical importance; for not only is it of little use to expel worms already existing in the intestines, unless we remove the tendency or disposition to their production, but, very frequently, many of the articles inconsiderately administered, (which however are regarded as valuable anthelmintics, because, by their operation, they bring away worms,) often do more harm to the individual who takes them than to the worms. It is clear that all articles which by their sharp angles merely irritate the worms must do much more injury to the inner coat of the stomach and intestines, and cannot possibly be introduced or insinuated between the mouths of the animals and the surface to which they are attached. The wood-cut (*fig. 4*) shews by what a number of hooks the *tape-worm* attaches itself to the gut. When we see these, need we wonder at the difficulty of expelling this formidable and most determined parasite?

The means employed to effect the ends proposed are very numerous, but reducible to three heads: viz., those which by increasing the peristaltic motion of the intestines, displace the worms, and often occasion their expulsion, as purgative medicines of different kinds; those which tend to increase the strength of the stomach and intestines, and system generally, as tonics, or analeptics; and lastly, those which are conceived to act in an especial manner on the worms, dislodging, weakening, or killing them—or anthelmintics, in the strict sense of the word. Our means must be varied, for not only are the different kinds of worms limited to different parts of the intestinal canal, and the species of worms infesting it different at different periods of life, but particular substances are found to be more efficacious against one species than against others.

As a part of the general treatment of worms, purgatives are indispensable, and those should be selected which bring away the greatest quantity of slime; but the frequent repetition of such is inexpedient. Calomel with jalap, or scammony may be given, with the interval of two days between each dose, two or three times, followed by tartrate of antimony in very small doses, for a week: this may be succeeded by aloes, with antimonial powder, which last being laid aside, preparations of iron alone, or with gentian and canella, may be united with the aloes. This plan may be pursued, whatever be the kind of worm supposed to be present, being merely intended to improve the general health of the patient. When the strength is somewhat increased, cold, which is very pernicious to the worms, may be added to our means of cure, and employed in various ways. Large quantities of cold water, rendered still colder by dissolving in it, immediately before drinking, a quantity of common table-salt, or muriate of soda, may be taken. Sea-water may also be drunk with great benefit.

Among our purgative means we must not omit to mention sulphate of potass and rhubarb, to which, if there be ner-

vous symptoms present, such as a tendency to epilepsy or hysteria, valerian may be advantageously added. Different mineral waters are of great service, particularly in the treatment of the maw-worm. These both remove the slime in which the worms nestle, and diminish the tendency to its formation. With this view we may have recourse to the Beulah Spa at Norwood, to Cheltenham, and above all, to the sulphureous springs of Harrowgate, followed by chalybeates there, or at Tunbridge.

The means of strengthening the digestive organs, consist of tonic and astringent medicines, both vegetable and mineral. Vegetable bitters are doubly advantageous, since they both strengthen the stomach, and prove direct poisons to the worms: of these, the best are chamomile tea, and infusion of quassia, or gentian, to which muriatic acid, or tincture of muriate of iron may be added; for children the tartrate of iron, being almost tasteless, is advisable. The utility of vegetable bitters is proved by the fact, that wherever the *menyanthes trifoliata*, (bog-bean,) or the tormentil grows, however damp the pastures may be, the rot never infests the sheep. A similar immunity from the rot is generally enjoyed by sheep fed on the salt marshes, or where salt is regularly mixed with their food. (See Reports of Lord Somerville.) The omission of a proper quantity of salt with our food favours the engendering of worms. The great tendency to the formation of worms in Holland has been mentioned, and when 'the antient laws of that country ordained men to be kept on bread alone, unmixed with salt, as the severest punishment that could be inflicted upon them in their moist climate, the effect was horrible; the wretched criminals are said to have been devoured by worms.' The medicines enumerated constitute the most effectual means of preventing the return of worms; those which follow are deemed the best for expelling particular kinds of worms. The tape-worm (*Tænia solium*) is almost invariably expelled dead, by a large dose of oil of turpentine; and even the long round worm is influenced by it in somewhat smaller doses. Scarcely any other article need be employed, unless the disagreeable smell and taste be objected to, when the *brayera anthelmintica* should be given as at once safe and efficacious: we might naturally expect this result, since it belongs to the same natural family tribe as the tormentil, viz. the *Rosaceæ*. The root of the pomegranate is much esteemed in India. No reliance should be placed on the root of the male fern, as it is only useful against the *Bothriocephalus latus*, or broad tape-worm, which, though common in Switzerland, is rare in Britain.

The long round worm is almost invariably expelled by the *Spigelia Marylandica*, or Indian pink, which belongs to the same natural family as the bog-bean, or water trefoil, viz. the *Gentianeæ*. The *Oxyures*, or maw-worms, are the most troublesome to the patient, and the most difficult to

remove, as medicines taken by the mouth are too much altered before reaching the rectum to produce any great effect. After the employment of the above-mentioned general measures, we should use local means only. The intolerable itching which they occasion about the rectum, is best relieved by a lavement of sweet-oil. A lavement of very cold water, or lime-water, may be useful, if after it, a portion of aloes be introduced, and left to dissolve in the bowel. Injections of tobacco, and the use of all such dangerous articles as bear's-foot, (*Helleborus foetidus*), are to be avoided. The same may be said of tin-slings, cowhage, and all things which can act only as mechanical irritants.

ANTHEM, in music, a word of doubtful origin, but supposed to be derived from *antiphona* (see ANTIPHONY), because antiently sung alternately by the two sides of the choir it then, however, was originally but a simple hymn, or kind of psalm-tune. The term is now applied to those compositions in use in all our choirs, set to verses from the psalms, or to any portion of the Scriptures or liturgy, and the anthem may be for one, two, or any number of voices, but rarely exceeds five parts.

There are three kinds of anthem,—verse; full, with verse; and full. The first, which is solo, or duet, &c., has only one voice to a part, and, requiring nicety of execution, is generally assigned to the best singers in the choir. The second, consisting chiefly of chorus, is sung by the whole choir, but the verse parts by single voices. The third is chorus wholly, and performed by all the voices.

The English school has always excelled in the composition of anthems. Tallis led the way in full anthems, and was immediately followed by Birde and Farrant. Their harmony is quaint, but indescribably solemn, and in true keeping with the Gothic structures wherein it was first heard, and still continues to resound, 'fanes whose 'high embowed roofs' soften and blend the tones of the 'full-voiced choir below,' and give an effect to the music which, Milton might well say, 'brings all heaven before our eyes.' Orlando Gibbons soon succeeded those masters, and in the same kind of anthem—but highly elaborated, and enriched with whatever florid counterpoint could supply—brought forth works that have always been, and must ever continue to be, admired, not for their ingenuity only, but their effect. Blow was one of the first to introduce the verse anthem, but his compositions, dry and stiff, are become nearly obsolete. Purcell, his pupil, produced numerous anthems, some few of them exhibiting striking beauties, and much grandeur of conception, but the majority, being written in the manner of his master, are more learned than pleasing. Michael Wise and Jeremiah Clark made our cathedrals acquainted with natural and pathetic melody; and Doctors Croft, Greene, Boyce, and Nares, in anthems of all the three species, united air and harmony, genius and learning, in a manner unequalled; though it is to be regretted that their works are so little known, except where choir service is performed, and so seldom heard, if ever, in our parochial churches and other places of worship.

ANTHEMIS is the genus of plants to which the useful herb chamomile belongs. It is of the compound flowered order, and is distinguished by having the scales that surround its flower-heads membranous at the border, like those of a chrysanthemum, from which genus it, in fact, differs chiefly in the receptacle of the flowers being furnished with little chaffy projections.

Anthemis nobilis, or chamomile, is frequent in a wild state on many of the commons near London, where it adds a peculiar richness of colour and fragrance to the turf. It is a very dwarf plant, with finely-cut leaves: its flower-heads are white in the ray, but deep yellow in the disk; all the parts are intensely bitter, but especially the little yellow flowers of the disk: for this reason the wild blossoms are far more efficacious than those of the cultivated sort, in which there is scarcely any disk; the flowers of the ray having almost entirely usurped their place. Besides the bitter principle for which chamomile is so celebrated, it has been found by chemists to contain camphor and tannin, and also a volatile oil of a beautiful blue colour.

There is another wild plant, called *Anthemis cotula*, or mayweed, which must not be confounded with chamomile, to which it bears great resemblance: it may be distinguished by its being an erect branching plant, with an exceedingly disagreeable and powerful odour.

Anthemis tinctoria is used in France by the dyers for the sake of a brilliant yellow tint, which is obtained from it.

1. Two joints of the *Tænia solium*, tape worm, magnified, in one of which are seen the numerous ova, or eggs. a. The osiculus by which they pass out. 2. Some of the eggs, much magnified. 3. Head of the animal, seen in front to show the mouth in the centre, surrounded by a circle of hooks, and the four suckers, a. a. a. a., of which two are alternately protruded, and two retracted. 4. The mouth with its hooks. 5. Two of the hooks, very greatly magnified. 6. A sucker, much magnified.

ANTHER. The part thus named in plants is the upper half of the stamen, or fertilizing organ, of a flower; it is the case which contains the pollen in which the principle of fertilization is inclosed. An anther generally consists of two hollow lobes, lying side by side, and united by a fleshy body, which is sometimes of great size, but more usually extremely small, and called the connectivum. Their position is, for the most part, such that, when they open, the line by which they burst is next the stigma, so that the pollen they emit may fall upon that organ; but to this there are many exceptions, and we sometimes find the anther so placed, that it is impossible to explain the manner in which its pollen can reach the stigma, without supposing the pollen to be conveyed by insects.

The deviations from the usual structure of the anther are caused, in most cases, either by the augmentation, or suppression of some of its parts. For example, the lobes sometimes grow together into one; and then the anther is only one-celled, instead of two-celled; or one of the lobes of the anther never grows, and then also it is one-celled. In other cases, each lobe is divided into two partitions by a plate that springs out of its back in the inside, and then an anther becomes four-celled. Anthers generally open by a line that passes along the face of the lobes from end to end; but it not unfrequently occurs, that a portion only of this line opens, and then they are said to burst by pores, as in the potato blossom.

The most singular deviations from regular structure are those in which the connectivum becomes excessively enlarged. In the hand-flower of Mexico, it is coloured deep red, and so long and fleshy as to be far larger than the lobes, and to resemble the talon of a bird of prey. In many of the ringent flowers it spreads horizontally, till the lobes are quite separated from each other at the base, and thrown from a perpendicular into a horizontal position: and in the common sage it forms a long, flat body, which looks exactly like a second filament placed across the first one.

The dehiscence, or act of bursting, of the anther, should take place at the exact time when the stigma is ready to receive the influence of the pollen, and this is insured by the following beautiful contrivance of nature. At the time when the flower is closed, all the parts contain much more watery matter than after its bursting; this superfluity of water is got rid of by the pistillum absorbing it like a sponge from the surrounding parts: by degrees the anther among the rest becomes dry, and as soon as that happens an immense number of tiny springs which line the anther, having no appreciable individual force, but a considerable power when combined, begin to contract sideways, and at last pull asunder the two sides of each lobe, which give way at the line of dehiscence above referred to, and the pollen falls out, or is ejected, according to the degree of rapidity with which the springs contract. It is scarcely possible to find in all the animated world a more striking proof of the perfect design with which every part of every living object is fitted for the fulfilment of the end of its creation.

If an anther is looked at in its most usual state, it seems so different from any other organ in plants, that one would not suspect it to be what it really is, a part of a petal in disguise. But if we look at a double rose, or a double pæony, or almost any other double flower in which the stamens are changed into petals, we shall find abundant proofs that an anther is only the upper end of a petal in a contracted state; each lobe will be seen to answer to one side of the petal, and the connectivum to be the central part of the petal; or if the evidence afforded by a double, and, therefore, a monstrous, flower be objected to, take a white water-lily, and you will see so insensible a transition from petals to stamens, that no one can say where the limit is between them, for many of the parts are half petals and half anthers. Botanists have numerous anatomical facts by which the real nature of anthers is further proved, but this would not be the place for an explanation of them; we can only point out to our readers the curious circumstance, that what are considered totally distinct organs, may be often shown to be nothing but other organs in masquerade. [See FILAMENT, POLLEN, STAMEN, SEXES OF PLANTS.]

ANTHOLOGY, a compound Greek word, used metaphorically, signifying a *Garland of Flowers*, viz. of poetry, and consisting of short poems on amatory, convivial, moral, funereal, monumental, descriptive, dedicatory, satirical, and humorous subjects. Their characteristic merit consists in the just expression of a single thought with

brevery and poetic beauty. The compass of a few couplets admits not of sublimity, but is well fitted to exhibit elegance without tediousness. The term *anthology* is peculiarly appropriated to a collection of Greek epigrams, taking the word not in the confined sense in which we now use it, for a pointed and witty conceit, but in the more enlarged and literal acceptation, of an *inscription*. The earliest and closest application of the term epigram was to certain short sentences inscribed on offerings in the temples. Inscriptions on buildings in general, on the statues of gods, heroes, living or dead men, next came under the denomination. They might be either in verse or prose. Their brevity, easily impressing striking events or illustrious names on the memory, recommended them also to general purposes. A moral precept, or the main bearing of a law, was embodied in this convenient form. The lover was sure to breathe out his passion in a simple strain of tenderness and gallantry. Hence, every little poem presenting one distinct idea, or insulated argument, gradually acquired the title of epigram. The largest portion of those collected in the Greek Anthology was written in honour of the dead, introducing their names and characters, or occupations; or as tributes to beauty, in gratitude for acceptance, or in complaint on account of rejection; some of them are panegyrics on living and illustrious virtue; others contain brief records of remarkable events; others again consist of observations on human life, for the most part in a dark style of colouring. The weariness of old age, the shortness and unsatisfactory tenor of human life, the murmurs of sickness, and the miseries of poverty, are favourite topics. Bacchanalian poetry is mixed up with exhortations to eat and drink, for to-morrow we die. This prevailing tendency must be ascribed to the vague notions, undefined prospects, and differently sustained hopes respecting our transition into some other state of existence by which the philosophers, poets, and ordinary men of these times were equally perplexed. But, however gloomy this view of things might be, it was compatible with a not unpleasing pathos, and raised their amatory and convivial effusions above vulgar voluptuousness, or mere festive riot.

Meleager the Syrian, whose exact date seems difficult to fix, lived probably somewhat less than a century before the Christian era, and is generally understood to have first collected the scattered fragments of the Grecian inscriptive muse. More than one person bearing the name of Meleager has been mentioned by Diogenes Laertius and by Athenæus, but the internal evidence of two epigrams seems to determine the epoch of that Meleager to whom we owe this beautiful collection. Its interest mainly arises from its being a record of the intellectual vigour of Greece in its declining days, when her energy, whether in arms or in arts, had become less active, but had not entirely died away.

To criticize, or even to name, the host of authors comprised in this collection would be tedious; we shall barely mention the successive forms in which it reappeared. Philip of Thessalonica continued the work about the time of Tiberius. The additional compositions were less interesting, but still pleasing. In the sixth century, Agathias collected the miscellaneous fragments of his time, and added his own contributions to the expiring muses of Greece. The bent of his own mind towards poetry seems to have been strong; in early youth he had produced a collection of amorous poems, entitled *Daphniaca*, which would have done honour to better times. He had a coadjutor in his friend Paul the Silentiary, an officer in the court of Justinian, corresponding to the modern gentleman-usher, whose topics were desultory, and his style that of the courtier and the voluptuary. From the decay of manuscripts, and the zeal of the clergy in the dark ages against all works of imagination or of gaiety, our present collection, although large, has lost many of its brightest and earliest ornaments; and it so happens, that it retains more pieces from the compilation of Agathias, than from that of his two predecessors conjointly.

In the tenth century, Constantinus Cephalas saved these manuscripts from oblivion by re-editing them. Maximus Planudes, a monk of the fourteenth century, was the last collector. His selection was marked by a want of discrimination. The first printed edition of the *Anthologia* was that of Lascaris, accompanied with some Greek verses by the editor, and a Latin epistle to Pietro de' Medici. It bears the date of Florence, 1494. Claude de Saumaise, better known to the world by the Latin name of Salmasius, and to Eng-

lishmen as the antagonist of Milton, who lived in the sixteenth and the first half of the seventeenth centuries, detected the unfitness of Planudes for the duties of an editor, by the discovery, in 1606, of a MS. in the library of Heidelberg. The history of this MS. may be seen in Schoell, (iii. 42, &c.) During the eighteenth century, Suidas and the manuscripts in the public libraries of Europe were ransacked, and a valuable booty of epigrams, undiscovered or rejected by Planudes, enriched the *Analekti* of Brunck and the *Anthologia* of Jacobs. The former work, *Analekti Veterum Poetarum Græcorum*, is contained in three volumes, octavo, Strasburg, 1772-6: the latter in thirteen volumes, octavo, Leipzig, 1794-1814. Jacobs was partly led to his undertaking by the motive of excluding the extraneous matter in Brunck's edition, picked up from fragments of the minor Grecian poets, which did not come properly within the definition of an anthology: but Jacobs himself retained the lyrics and elegiacs of Simonides, the remains of Archilochus and Bacchylides, and the hymns of Proclus. The edition of Jacobs is the latest, and best. But there is much matter strictly applicable to this purpose still left unedited. There are some inscriptions, for instance, in the Elgin collection of the British Museum, that ought to be added to any future edition.

A volume of translations, chiefly from the Greek *Anthology*, was published in 1806 by Messrs. Bland and Merivale, with contributions from other gentlemen. This has been twice republished; once in 1813, with a considerable mass of extraneous and irrelevant matter in the shape of notes and illustrations, both in prose and verse; and again in 1833. In the last edition, the superfluities of the preceding one are removed, and a number of additional specimens, many of them by younger translators, are introduced: and in this state the work may be recommended as presenting a very elegant and faithful specimen of the original Greek Anthology, and one which is not likely to be surpassed. (For a full account of the editions, &c. of the Anthology, see Schoell, *Geschichte der Griech. Litt.* vol. iii.)

ANTHONY, ST., the first institutor of the monastic life, was born at a village in Upper Egypt, in the year 251. His parents, who were wealthy, are said to have prevented him, when young, from acquiring any other language than his native Coptic. Having understood some passages of our Saviour's precepts in their literal sense, he distributed the property which came to him by inheritance, at an early age, partly among his neighbours and partly to the poor; and having placed a sister who was committed to his charge in a house of virgins, retired to a solitude in the neighbourhood of his native village, where he is represented to have been tempted by the devil in a great variety of shapes. In this retirement he was reputed to have received the gift of miracles. A great number of disciples, in consequence, crowded about him, at whose importunity he erected various monasteries, where they passed their time in acts of devotion and in manual labour. He is said to have erected his first monastery at Phaïum, near Aphroditopolis, about the year 305.

In 312, during the persecution under Maximinus, he went to Alexandria to encourage and give consolation to the Christians, who were suffering martyrdom; and about the same time, built a second monastery called Pispir, near the Nile.

After a long residence in the place of his first retreat, he withdrew farther from his native village, to Mount Colzum, near the Red Sea, where he made a ruined sepulchre his residence. Here also followers flocked to him, and fraternities for seclusion and mortification were formed under his example; and here he was again assailed by the devil.

Toward the close of life, about the year 355, St. Anthony again went to Alexandria, at the request of Athanasius, to defend the faith against the Arians. At this time he is said to have converted many to Christianity. Declining to accept an invitation from the Emperor Constantine to visit Constantinople, he returned to his cell, where he died in the year 356. The most ancient martyrologies naming him on the 17th of January, it has been concluded, that that was the day of his death.

Seven of St. Anthony's letters, written originally in Coptic, but translated into Latin, are extant in the *Bibliotheca Patrum*. His life was written by his friend St. Athanasius. St. Anthony left one of his sheep-skins, with the cloak in which he lay, to Athanasius; his other sheep-skin to the bishop Serapion; and his hair shirt to Macarius and

Amathas, two brethren, or disciples, who were with him at his death.

Among the miracles believed to have been wrought by his intercession, was the cure of the distemper called the sacred fire, since that time called St. Anthony's fire, and in modern days erysipelas. In 1095, a religious order was founded in France, called the Order of St. Anthony, the members of which were to take care of persons afflicted with this disorder.

The temptations of St. Anthony were favourite subjects with the early engravers; probably from the scope which they afforded for invention and imagination. Vasari says that Michael Angelo, when a boy, was so struck with Schongauer's print of St. Anthony tormented by devils, (the earliest of these productions,) that he copied it in colours. (See the *Acta Sanctorum* by the Bollandists, January 17; Alban Butler's *Lives of the Saints*; Moreri; and Cave's *Historia Literaria*.)

ANTHONY, ST., FALLS OF, are in the Mississippi River, in 45° N. lat., immediately above the junction of St. Peter's River. [See MISSISSIPPI.]

ANTHONY'S, ST., FIRE. [See ERYSIPELAS.]

ANTHOXANTHUM, a genus of grasses, one species of which (*A. odoratum*) is well known to farmers under the name of the *sweet vernal grass*. It is a small annual plant, bearing its flowers in short heads, which are not very compact, and broader at the bottom than the top. The flowerets of which it is composed are a pale, yellowish green; each consists of two sharp-pointed, smooth glumes, within which are two other dark-brown, hairy paleæ, each having an awn at its back; the stamens are only two in number. This grass is of little importance for its nutritive qualities, but it is much esteemed for the sweet smell of its leaves, which causes much of the well-known fragrance of new-mown hay.

Anthoxanthum odoratum.
a, a flower-head magnified. b, a floweret more magnified.

ANTHRACITE, a black, light, mineral substance, resembling coal; so named from *ἀνθραξ*, *anthrax*, charcoal. It is also called *blind coal*, because it burns without flame; and *glance coal*, from the German word *glanz* (lustre), because it has often a shining surface like graphite, or blacklead, as it is improperly called, the substance of which pencils are made, and to which it is very closely allied in composition. In some systems of mineralogy it is divided into *massive*, *slaty*, and *columnar anthracite*; but these are mere accidental varieties of structure, and are all of the same chemical composition; when the pure anthracite is separated from the matrix, or from the foreign matter with which it is mechanically mixed. Its specific gravity is about 1400,

water being 1000; it is slowly combustible, but with out flame, and according to the analysis by Schaub of a specimen from the Meisner, it contains 96 per cent. of pure carbon: it is, in fact, a mineral charcoal. Naphtha may be considered as one extremity of the mineral carbonaceous substances, and anthracite as the other; and from the highly-inflammable fluid naphtha, we have numerous varieties of mineral tar, or petroleum, bitumen, asphaltum, cannel coal, caking coal, slaty coal, &c., all diminishing in inflammability, until at last we come to the blind coal, or anthracite. If asphaltum, or indurated mineral pitch, be subjected to distillation, at a certain stage of the process, when it has lost a part of the bitumen which it contains, it resembles caking Newcastle coal; continuing the distillation, it passes into a substance which is identical with anthracite, both in appearance and composition. It very often happens that the coal strata in our mines are traversed by dikes of basalt; and it is a frequent occurrence in such cases, that the coal, where it comes into contact with the basalt, is converted into anthracite, often to a considerable depth, and it sometimes acquires a columnar structure. From these circumstances, geologists have drawn two inferences: first, that the basalt, when it came in contact with the coal, must have been in a melted state like lava, the heat driving off the bitumen of the coal; and, secondly, that anthracite, when found in other strata than the coal-measures, may very probably be coal altered by heat. Small quantities of anthracite are found in the primary strata of most countries, as, for instance, in the old slate of Cornwall, Devon, and Cumberland, where the appearances led to borings and other works in search of coal. It has been frequently met with in the rocks of the transition series, but it was never known to exist in rocks of that period in considerable quantity, until Mr. Weaver, three years ago, in a paper on the geology of the South of Ireland, described beds of anthracite occurring in clay-slate and granwacke, so thick as to be regularly worked for the purpose of burning the lime of the district. He says that the most considerable collieries have yielded 25,000 tons annually, and adds, that all the coal of the province of Munster, with the exception of that of the county of Clare, is of the same sort. It is remarkable, too, that this anthracite coal, and a slate highly charged with pyrites, which accompanies it, are full of impressions of plants of the fern tribe, such as *equiseta* and *calamites*, analogous to those found in the true coal-formations; this is an important circumstance with reference to the history of anthracite, and gives strong countenance to the opinion that this substance, even in the oldest of the stratified rocks, is of vegetable origin. It is found in many of our coal-mines, but generally in those situations where the coal comes in contact with basalt. It is also met with where basalt comes into contact with carbonaceous deposits, of more modern date, as at the Meisner, a mountain near Eschweg, in Hesse.

ANTHROPOGRAPHY, a term designed to express the object of one branch of physical geography.

The object of anthropography, which literally signifies *man-description*, is, to describe the actual geographical distribution of the human race; to classify it according to the varieties of physical character and language; to distinguish between nations or tribes which have the same general physical character and speak the same language, and nations or tribes which seem to belong to one stock, and have from circumstances adopted the language of another stock; to describe briefly the religious and domestic usages which constitute the basis of national character.

The term ethnography (nation-description) is sometimes used by German writers in the sense which we have given to anthropography; though, as far as we have observed, when so used, the word ethnography is rather more limited in its signification than that which we have assigned to anthropography. Some German writers use also the word *Völkerkunde* (people-knowledge) as an equivalent to ethnography. But ethnography has of late years been rather used to express an historical investigation into the origin and migrations and connexion of various peoples. Taking it in this sense, ethnography is purely of an historical character, and may be considered as distinct from anthropography. A series of anthropographies, of different epochs, would form the true basis of ethnography.

ANTHROPOLOGY, derived, like most of our other terms in science, from the Greek, implies the science or

theory of man. It has been little cultivated among us as a separate study, notwithstanding its obvious importance, and has never, we believe, been made the subject of an especial course at our universities. It is otherwise, however, in Germany, where various professors have read lectures on it, and subsequently published their treatises. Of these, by far the most distinguished is that of Kant, the last, and from its nature, as divested of abstruse speculation, the most popular of his works. It was published by him about the year 1798, from his text book, having been for thirty years accustomed to give a winter course of lectures on this subject, and another during the summer on physical geography, to a mixed audience, as a relief from his more severe duties as professor of pure philosophy. His observations supply the best notion of that which ought to constitute such a science, and the uses to be drawn from it, when properly executed.

A theory of the science of man, systematically executed, may either be directed to explain the phenomena and principles of our corporeal nature - and in that case it would be properly called *physiological*; or it might be calculated to furnish instruction for the cultivation and improvement of our intellectual and moral powers, and the knowledge of man, both as an individual and a species, in which case it might be termed *pragmatical anthropology*. The former, it is evident, turns on the investigation of what nature makes of man - the latter on what man, as a free agent, either makes, or can and ought to make of himself. If the cause of memory in man is assumed to be impressions left behind in the brain, he must be content to remain a mere spectator of Nature's mechanism, and can turn his observations to no account: whereas, if he applies his experience of what has been found useful or prejudicial to memory, in order to acquire greater power or facility in its exercise, the knowledge thus obtained, being formed into a system, would constitute that branch of anthropology which we have called *pragmatical*, and which it would be useful for him to cultivate.

Such an anthropology, considered as knowledge of the world, is subsequent in its cultivation to the period of academical studies; it considers man as a citizen of the world, and has nothing properly to do with the natural varieties of the human race: neither does it invade the secluded circle of what is called the great world, the individuals of which are too near to each other, and too remote from the rest of their species, to be observed with advantage. Among the best means for cultivating it, after laying in a proper store of that general information which takes precedence of all local and partial knowledge, is travel, and the reading of travels - to which may be added as aids, if not direct sources of anthropology, history, biography, the drama, and even novels and romances.

The chief obstacles to its acquirement, and attaining the rank of a science, are, in others, the unwillingness to be observed - *in ourselves*, the counter check, that while we are under any emotion, we cease to observe, and when we observe, the emotion ceases: lastly, the force of habit, which perplexes our judgment, both as to what by nature we ourselves are, and what our neighbour is.

A systematic, and yet popular anthropology, such as is described in the following outline of Kant's work, illustrated with examples accessible to all readers, is calculated to be of great utility, by affording, in the copiousness of the tabular heads under which our active qualities are arranged, so many occasions and inducements to select any one for special study and classification in its proper department. In this manner, the separate labours of individuals, and even casual contributions, would, in the unity of the plan, acquire a spontaneous distribution and progressive concentration towards a whole - thus forwarding and accelerating the growth of so useful a science.

CONTENTS.

Part I.—*Anthropological Didactic, or instructions for learning both the Interior and Exterior of Man.*

Book I. Of the Faculty of Cognition.

Of Self-consciousness.

Self-love (egoism).

Actual consciousness of our representations.

Self-observation.

Representations we have without being conscious of them.

Distinctness and indistinctness in the consciousness of our representations.

Sense in opposition to reason.

Apology for sense.

Our power in respect of the faculty of cognition in general.

Artificial play with sensuous appearance.

Allowed moral affectation (counterfeiting).

The five external senses.

The internal sense.

Causes of the increase or diminution of sensations in degree.

Obstruction, weakening, and total loss of sensation.

Sensuous inventive faculty in its different species.

Faculty of bringing the past and future before us by the imagination.

Involuntary fiction in health, *i. e.*, dream.

Faculty of design.

Faculty of cognition in as far as grounded on understanding.

Infirmities and diseases of the mind, with respect to its faculty of cognition.

Talents in the faculty of cognition—wit, sagacity, and originality or genius.

BOOK II. Of the Sense of Pleasure and Pain.

Of sensual pleasure.

A.—Sense for the *agreeable*, or sensual pleasure in the perception of an object.

B.—Sense for the *beautiful*, or taste.

BOOK III. Of the Faculty of Desire.

Of the affections (emotions).

Passions.

Highest physical good.

Highest moral-physical good.

PART II. Anthropological Characteristic, or the way to find out the Interior from the Exterior.

A. Of the character of the person.

1. Disposition.

2. Temperament.

3. Character of the mind (mode of thinking).

Physiognomy.

B. Character of family.

C. „ of nation.

D. „ of race.

E. „ of species.—*Delineation of the Character of the Human Race.*

(See Kant's *Anthropologie in pragmatischer hinsicht*. Fourth edition. Pp. 323. By J. F. Herbart. Leipzig, 1833.)

ANTHROPOPHAGY. [See CANNIBALS.]

ANTHROPOMORPHISM, a compound Greek word, literally signifying 'the representation of human form'; but it is properly used to signify the 'representation of divinity under a human form'; and the nations or sects who have followed this practice have been sometimes called Anthropomorphites. The Egyptians represented deities under human forms, as well as those of animals, and sometimes under a combination of the two. The ancient Persians, as Herodotus tells us, (i. 131,) adored the Supreme Being under no visible form of their own creation, but they worshipped on the tops of mountains, and sacrificed to the sun and moon, to earth, fire, water, and the winds. The Hebrews were forbidden (Exodus xx. 4, 5) to make any image or the representation of any animated being whatever.

The Greeks were essentially anthropomorphists, and could never separate the idea of superior powers from the representation of them under a human form: hence, in their mythology and in their arts, each deity had his distinguishing attributes and a characteristic human shape. Perhaps no nation has made any progress in the arts of sculpture and painting without applying their skill to the representation of deity. Thus painters in modern times have represented the Supreme Power, and our Bibles have sometimes been illustrated with engravings of this character. In one of the latest editions of the Bible (Mant and D'Oyley's), which is illustrated by engravings, the editors have omitted all representation of God, though there are earlier English editions of the Bible in which the Supreme Being is represented as a man. It might be worth while considering if some improvement could not be made even on Mant and D'Oyley as to the choice of illustrations.

Anthropomorphists is also the name of a sect of early Christians. [See HERETICS and SCHISMATICS.]

ANTHUS, (Bechstein,) the Pipit, a genus of birds separated by Dr. Bechstein from the Linnæan genus *Alauda*, a separation followed by Temminck, Cuvier, Lesson, and Selby, and justly, for though the pipits have a long hind claw, and are usually coloured, like the larks, their bill is more slender, in consequence of which they never, like them, feed on grain. In the form of the head, in the movement of the tail, and their mode of life, they resemble the wag-tails (*Motacilla*) on the one hand, and on the other the blue-breast (*Sylvia Suecica*).

Adhering, then, to the distinction of Bechstein, we characterize pipits by the bill being straight, slender, somewhat awl-shaped towards the point, having the base of the upper mandible keeled, the tip slightly bent downwards, and notched. The nostrils, situated at the sides of the base of the bill, are oval, and partly concealed by a membrane: Feet, with the shank (*tarsus*) generally exceeding the middle toe in length: toes, three before and one behind, and with the outer toe adhering to the middle one as far as the first joint; the hind claw rather long. The wings have the first quill very short; the third and fourth the longest in each wing.

We shall give particular details of each species under *Pipit*.

ANTIARIS is the botanical name of the half-fabulous upas-tree, of which so many idle stories were propagated some years since by travellers. It was said to be a large tree, growing in the island of Java, in the midst of a desert caused by its own pestiferous qualities; its exhalations were reported to be so unwholesome, that not only did they cause death to all animals which approached the tree, but even destroyed vegetation for a considerable distance round it; and, finally, the juice which flowed from its stem, when wounded, was said to be the most deadly of poisons. To approach the upas-tree, even for the momentary purpose of wounding its stem and carrying away the juice, was stated to be so dangerous, that none but criminals under sentence of death could be found to undertake the task. As is usual in such cases, this fable is founded upon certain natural phenomena which occur in Java. There is such a tree as the upas, and its juice, if mixed with the blood in the body of any animal, is speedily fatal; and there is also a tract of land in the same island on which neither animal nor plant can exist. But the two circumstances have no relation to each other: the poisoned tract is a small valley completely surrounded by a steep embankment, like the crater of a volcano, and is continually emitting from its surface carbonic acid gas, which is alike fatal to animals and plants; on the other hand, the poisonous upas-tree is not an inhabitant of the valley, for nothing can live there, but it flourishes in the woods, in the midst of other trees which are unharmed by its vicinity. (For particulars concerning this fable, see

Antiaris macrophylla (a diminished figure).

1. a head of male flowers in the involucre; 2. the same divided perpendicularly; 3. a couple of the male flowers; 4. pistillum; 5. the same divided perpendicularly; 6. a fruit.

Darwin's *Botanic Garden*, and the *Penny Magazine*, vol. ii., p. 322; for an account of the Valley, consult the *Journal of the Geographical Society*, vol. ii., p. 60.)

In the eye of a botanist, the upas is a species of the genus *Antiaris*, which belongs to the natural order *Artocarpeæ*, a group of plants all of which abound in a milky juice, and many of which are extremely poisonous. (See *ARTOCARPEÆ*.) Of the original species, *A. toxicaria*, we have met with no scientific figure; it is, however, cultivated in the botanical garden, Calcutta, whence we have a leaf or two. They are very much like those of the following plant, *A. macrophylla*, which has been found on the north coast of New Holland.

The genus *Antiaris* has its stamens and pistilla in separate flowers. The former are collected in little heads in the centre of a minute three or four-leaved calyx, of which a considerable number is inclosed in a hairy involucre formed of several fleshy divisions, which are rolled inwards. The pistillum is surmounted by a calyx of several leaves, terminating in a long, two-parted style, and contains a single suspended ovulum. The pistilla and the antheriferous flower-heads stand in pairs, side by side, in the axillæ of the leaves.

ANTIBES, a fortified town and port of France, on the Mediterranean, in the department of the Var, very near the frontier of the Sardinian dominions, 587 miles S.E. by S. of Paris, and about 19 miles S.W. of Nice, 40° 33' N. lat., 7° 7' E. long. from Greenwich.

It is a place of great antiquity, having been founded by the Greeks who had settled at Massalia, now Marseilles, as a barrier against the incursions of the Salyes, and the Ligurians who inhabited the Alps. (Strabo, p. 180.) Some accounts state that the Marseilles took it from a tribe of Ligurians; but however this may be, the place probably owed its importance, as well as its name, (*Ἀντιπολις*, Antipolis,) to the Greeks. It was taken from under the jurisdiction of Marseilles, and placed in the rank of an Italian city (Strabo) in the time of Augustus; and appears to have been a flourishing place, to which the tunny fishery may have contributed. The remains of a theatre and some other ancient buildings attest its former importance. During the Roman dominion there was an arsenal; and the town was protected by fortifications, of which two strong towers yet remain. After the downfall of the Roman empire, Antibes became subject to successive nations of barbarians, Visigoths, Ostrogoths, and Franks. It was destroyed by the Saracens in the ninth century, rebuilt and repopled in the tenth, and again plundered by Spanish and Moorish pirates. In 1746, it stood a siege against the Austrians, aided by England and Savoy. It signalized itself in 1815, by shutting its gates against Napoleon on his return from Elba.

It is built on the eastern side of a small peninsula, dividing the gulf of Juan from that into which the Var falls; in a district fertile in wine and fruits, especially oranges, but little productive of the other necessaries of life. The harbour, which is nearly circular, is so choked up with the sand brought by the Var, the mouth of which is only a few miles distant, that, in all the extent of the basin, there is only a space of less than 300 feet by 950 feet where vessels can anchor; and to approach the mole they must not draw above fifteen feet of water. The trade of Antibes, which is but small, is chiefly in oil, olives, dried fruits, and especially salt fish. The inhabitants, who amount to about 5000, are considered very skilful in preparing anchovies.

Antibes is a place of considerable strength, though not in the first class of fortresses. There is a citadel and several batteries and forts for the protection of the harbour. The fortifications appear to have been erected in the times of Francis I. and Henry IV., and improved by Vauban in the days of Louis XIV. Their erection has served to drain the surrounding marshes, and render the air healthy. (*Encyclopédie Méthodique; Dict. de la France; M. Brun; Balbi.*)

ANTICHRIST (*Ἀντίχριστος*) means, literally, the opponent of the anointed, or of the Messiah. The name of Antichrist (*אנתקריסטוס*) was given by Jews and Christians to the great enemy of true religion, who shall, according to the Holy Scriptures, appear before the coming of the Messiah in glory. The general woe effected by Antichrist is called by the Jews *חבלי משיח* or the pangs of the birth of the Messiah.

The name of Antichrist occurs in the New Testament only in the first two epistles of St. John: 1 Epist. ii. 18, 22,

iv. 3; 2 Epist. 7. In some of these passages false teachers are called Antichrists, and every spirit that confesseth not that Jesus Christ is come in the flesh is not of God; and this is that spirit of Antichrist, whereof ye have heard that it should come; and even now already ~~is in~~ the world. St. Paul calls Antichrist that *man of sin*, the son of perdition; who opposeth and exalteth himself above all that is called God, or that is worshipped; so that he sitteth in the temple of God, showing himself that he is God. That wicked whom the Lord shall consume with the spirit of his mouth, and shall destroy with the brightness of his coming; whose coming is after the working of Satan, with all power and signs and lying wonders. 2 Thess. ii. Emblematical descriptions of Antichrist occur in the twelfth and thirteenth chapters of the Revelations. One of the newest German novels bears the title *Antichrist*.

ANTICOSTI, an island lying in the mouth of the river St. Lawrence, between 49° 5', and 49° 55' N. lat., and between 61° 54', and 64° 30' W. long.

This island does not possess a single harbour. Its shore on the north side is high, and the water close to the shore deep; on the south the land is low, and the water shoal. Some rocky reefs extend to a considerable distance from the shore, and are the cause of numerous shipwrecks. The island is uninhabited, with the exception of two families who have been established here by the governor of Newfoundland, one at the east, the other at the west end, for the purpose of giving help to persons cast away upon the coast. The surface is covered with white cedar, birch, fir, poplar, and dwarf spruce trees, all of which are stunted in their growth. Bears, foxes, hares, and sables are numerous, as well as partridges, curlews, plovers, and snipes. The interior has never been explored by Europeans. Such Indians as have visited it in search of game describe it as being mostly swampy.

The Indian name of this island is Natiscoti, of which its present name is evidently a corruption. It is included within the government of the Island of Newfoundland. (Anspach's *History of Newfoundland*; McGregor's *British America*.)

ANTIDICOMARIANITES. [See HERETICS.]

ANTIDOTES, from two Greek words, signifying, *given against*; the means of counteracting the effects of poisons. The term *antidote* had formerly a much wider signification, and was applied to the remedies for diseases occurring from natural causes, as well as to the remedies for the derangements of the functions arising from the direct introduction into the system of a known and material poison. Doubtless every disease may be looked upon as springing from some poison; as fevers from an altered and unhealthy state of the atmosphere; or eruptive and contagious diseases from the vitiated fluids or breath of one individual communicated to another, as small-pox, and hooping-cough. This opinion is expressed by the employment of the term *virus*, or *poison*, to signify the immediate cause of such diseases: as when we speak of the small-pox virus, or the vaccine virus.

But as, in the present day, the word *antidote* is used only to signify the means of counteracting the effects of poisons, strictly so called, we shall confine our observations to what is properly comprehended under the term, when employed in this sense. While thus limiting its signification, it is equally necessary that we should limit the application of the word *poison*. It is, however, extremely difficult to define what a poison is. Fodere considers poisons to be 'those substances known to be capable of rapidly altering or destroying some or all of the functions necessary to life.' This must be understood to apply to their introduction (whether accidentally, intentionally on the part of the person suffering, or criminally on the part of others) into the body when in the usual state of health; for there are certain diseased conditions of the system, which seem to render it incapable of being injuriously affected by doses of medicines which at another time would speedily destroy life; and other states, such as when the body is under the influence of one poison, where another proves the most effectual remedy or antidote. This latter state is strikingly exemplified in the case of the bite of the *Crotalus carolinus*, a species of snake common in the West Indies, during the state of stupor or insensibility occasioned by which, a large quantity of arsenic may be given, not only with safety, but with such advantage that the recovery of the patient may be considered as owing solely to it.

To acquire a correct idea of the different ways in which

poisons operate in destroying life, we must be made aware that what we commonly regard as an *individual*, is made up of a number of distinct organs, which, though in some respects independent of each other, yet exert a reciprocal influence, the harmonious play of the whole being necessary to the continuous exercise or display of the principle of life, and that a cessation of the functions of any one of the more important organs necessitates the successive suspension of the rest. The most essential of these are consequently denominated the *vital functions*, viz., the circulation, respiration, and innervation. The circulation of red or *arterial* blood through the system, but especially through the nervous matter of the brain and spinal chord, is essential to the existence of the vital properties, and due performance of the functions, of the different organs,—which circulation is effected by the action of the *heart*,—while, to render the blood arterial, respiration is necessary, and this is effected by the *lungs*, assisted by a great number of muscles, the co-operation, or simultaneous action of which, is occasioned by the influence of the *spinal chord*, directed or influenced by the *brain*. Now, certain poisons act either solely on one of these organs and functions, or upon two or three, but always in an ascertained order or uniform succession. Oxalic acid, (or the acid of sugar, as it is popularly called,) for example, in a small dose, acts first on the brain and spinal chord, but in a larger dose, also affects the heart: in the former case, the respiration will be perceptibly interfered with, while the heart will go on acting for some time; in the latter case, both will cease at the same moment. Recovery, therefore, is much more probable in the first instance than in the second: for we can carry on *artificial* respiration till the brain and spinal chord have resumed the exercise of their functions; but if, as in the second instance, the heart also has ceased to act, recovery is impossible.

An arrangement of poisons according to their mode of action, *i. e.* according to the order in which the vital functions are successively affected and destroyed by them, would be of great utility in regulating our treatment, teaching us when to be content with the employment of antidotes alone, and when to employ supplementary means,—as artificial respiration, blood-letting, &c. At present we can only make an approximation to such an arrangement.

Another point of consequence is the settlement of the question. Do poisons act solely on the sentient extremities of the nerves of the part to which they are applied, and influence remote organs, only by sympathy, or are they absorbed into the circulating fluids, and by them carried to the organs, whose impaired or suspended functions show them to be markedly affected by them? Without entering into this dispute, it may be stated that some poisons act in the one way, some in the other way, and a few in both. Of these, the first set are the most formidable and the most speedy in their action, allowing little time for the employment of antidotes.

Some poisons act, but with different degrees of violence and speed, whatever part of the body they are applied to; others, again, only when received into the stomach or intestines; while some, such as the poison of the viper, are quite powerless when swallowed. Of all parts of the body, the brain and nervous substance are the least susceptible of the action of poisons, when applied directly to them, though acted upon by so many poisons when applied elsewhere.

With respect to the local operation of poisons, *i. e.* their direct action on the part to which they are applied, some decompose chemically, or alter the structure of (corrode) the part which they touch, and hence they are called *corrosive* poisons; such are the mineral acids, of which sulphuric, or oil of vitriol may serve as an example. Besides this local effect, many of the corrosive poisons act speedily upon remote organs, the impaired function of which may become a source of greater danger than the destruction of the part first attacked.

Other poisons, without immediately altering the structure of the part, irritate it so that inflammation ensues, by which it is altered, and the general system affected, as it would be by inflammation of the same part arising from any other cause—even when the poisonous substance does not produce any immediate or powerful effect upon a remote organ—which is not often the case, as most of them influence some of the vital functions, and thus prove fatal. These are termed *irritant* poisons, such as arsenic; but they are frequently also termed *corrosives*, though inaccurately.

Lastly, there are poisons which neither corrode nor irritate the part, but cause a peculiar impression upon the sentient extremities of the nerves, which is conveyed along these to some remote organ or organs, the function of which they impair or suspend. Many of these should be termed *sedatives*, in the strictest sense of the word [see *SEDATIVES*]; others are narcotics; and those which produce some degree of local irritation, are termed *narcotico-acrids*. But often one and the same article, according to the dose and mode of administration, acts in all the three ways; tobacco for example.

The selection of appropriate means to counteract the effects of poisons must be determined by a knowledge of the manner in which each particular poison acts; but as we cannot enumerate or specify these here, we shall give only general rules to this effect. These may be reduced to three, viz., 1. to remove the poisonous substance: 2. to prevent or limit its local effects: 3. to obviate its effects on remote organs, supporting their action by appropriate measures, till the injurious impression has subsided. The first of these is to be accomplished mostly by mechanical means. If the poison has been applied to any external part, as by the bite of a viper, or rattle-snake, a cupping-glass, or what will answer as well, a wine-glass, tumbler, or cup of any kind, from which a part of the air has been expelled, by holding within it a lighted candle for a second of time, should be immediately applied. If the poison has been taken into the stomach, and is not of a kind to arrest instantly the action of the heart, its removal is to be attempted by the stomach-pump, or by exciting vomiting. The stomach-pump cannot well be used without introducing into the stomach a considerable quantity of water, which, by diluting the poison, lessens its violence, in all cases, except that of oxalic acid. The stomach-pump is also to be preferred in the case of narcotic poisons, as the insensibility which they occasion prevents the stomach from being affected by emetics. But should a stomach-pump not be at hand, nor any one be present skilled in the use of it, we must attempt to produce vomiting by every means in our power. For this purpose, a table-spoonful of flour of mustard, which is mostly to be found in every house, may be put into a tumbler of warm water, and given to the patient; or a scruple of sulphate of zinc (white vitriol) dissolved in a pint of distilled water; or ten grains of sulphate of copper dissolved in half a pint of any distilled water, as cinnamon, may be drunk by the patient, and the disposition to vomit encouraged by tickling the throat with a feather, and pressing on the pit of the stomach. Neither ipecacuanha nor tartar emetic should be given, as their action is always preceded by much nausea, during which the absorption of the poison is often facilitated.

Where the poison is of a corrosive or irritant nature, instead of losing time in seeking the means of causing vomiting, it is in general advisable to adopt the second rule, and attempt to prevent or limit its local, and thereby its remote, effects. To accomplish this, we must ascertain what the poisonous substance was from which the patient is suffering, and must also know how it acts, as upon this depends the success of our treatment. The objects we must have in view are either to dilute, and so weaken it; to supply from an external source the particular principle, which the poison would abstract from the coats of the stomach; or by adding something to it, so change its nature as to render it comparatively or altogether harmless, which last will always be effected if we can succeed in forming an insoluble compound. The first may be done by giving plenty of warm water; and when we know the particular poison, if the warm water can be made the vehicle of an antidote, the second or third object will also be ensured. Suppose sulphuric acid (oil of vitriol) has been swallowed, add to the water, chalk, magnesia, or soap: the chalk will make, with the acid, sulphate of lime, which being insoluble, will do no harm, while with the magnesia the acid will form sulphate of magnesia (Epsom salts), and with the soap sulphate of potash, both of which are purgative salts, and will, by their action on the bowels, assist in lessening the inflammation caused by the poison before it was decomposed. So when sugar of lead (acetate of lead) is swallowed, by giving Epsom salts we form an insoluble sulphate of lead, which will be discharged by the bowels, operated upon by the magnesia, which has been freed from the sulphuric acid. Corrosive sublimate (bi-chloride) of mercury abstracts from the coats of the stomach the albumen which they contain, by which it is converted into proto-

chloride, or calomel; now, if by giving White of egg, which is pure albumen, we supply it with the principle which it would otherwise obtain from the coats of the stomach, we shall preserve these entire.

Such means, then, are antidotes, properly speaking; for the means by which the secondary or remote effects are to be combated, deserve rather to be termed counter-poisons. The counter-poisons are of no small value in cases of poisoning by the corrosive and irritant, while they are of the utmost importance in the treatment of the sedative and narcotic poisons. To administer these appropriately, we must know which of the vital organs the poison most speedily affects. When it affects the heart, the symptoms greatly resemble syncope (or fainting), and as such poisons are the most dangerous, agents which act as rapidly as the poisons are alone to be trusted to: such agents are to be found among the diffusible stimuli, ammonia, or its carbonate, *i. e.* smelling salts, applied to the nostrils, or dissolved in water and taken into the stomach, warm brandy and water, &c. Where it chiefly affects the spinal marrow, there occur spasms and difficulty of breathing; and when the brain, there is partial or complete insensibility (coma), often with, at first, full pulse, flushed face, and laborious breathing, resembling apoplexy. In such a state of affairs, artificial respiration, and afterwards bleeding, with the subsequent administration of coffee or vinegar, greatly contribute to save the patient.

We have not spoken here of gaseous poisons, which would lead to unnecessary details. They act either by excluding the common atmospheric air, in which case removal into pure air is required; or by producing inflammation, like the irritant, or oppression of the brain, like the narcotic poisons, and are to be combated on similar principles. It will be more useful to append a list of the poisons which act on the brain, and of those which act on the heart. Of poisons which act upon the brain, the most common are alcohol, *i. e.* spirituous liquors, opium, henbane, hemlock, camphor, and the essential oil of almonds, and of tobacco. Of those acting on the heart, the chief are, infusion of tobacco, and large doses of prussic acid, foxglove, strychnia (principle of nux vomica), oxalic acid, arsenic, preparations or salts of antimony and of baryta, and several animal poisons.

From what has been said on this subject, the great necessity of an acquaintance with it must be sufficiently clear, not only to insure our doing right, but to prevent us from doing wrong. By administering an ill-timed antidote (as we conceive it to be), we often hasten the fatal event: as where vinegar is given when opium has been swallowed, before it has been ejected from the stomach; and by throwing tobacco smoke into the bowels of a person apparently drowned, we extinguish the feeble spark of life which might have sufficed to reanimate him but for such injudicious interference.

It is to be hoped that more just principles of treatment will be diffused among the people, as well as among medical men, by which many lives may be preserved to their families and to the community. [See POISONS.]

Silver Coin, British Museum.

ANTI'GONUS, one of the officers of Alexander the Great, a Macedonian by birth, who took a leading part in the scramble for kingdoms which ensued among that prince's generals after his death, *n.c.* 323. From that time till his own death, *n.c.* 301, the history of Antigonos is in great measure the political history of western Asia. It comprises a long and intricate series of wars, in which extensive provinces rapidly changed their masters; but it is chiefly interesting as connecting the rise of the two great dynasties of the Ptolemies and the Seleucidæ with the establishment of the Macedonian empire in the east.

For the immediate consequences of Alexander's death, we refer to **ANTIPATER** and **PERDICCAS**. In the general distribution of provinces, or satrapies, to the chief Macedonian officers, Antigonos received the greater Phrygia, Lycia, and Pamphylia. But as soon as Perdikkas conceived the project of rendering himself the real master of all the Macedonian conquests, he sought the ruin of Antigonos, as the most likely person to thwart his views. Antigonos saw his danger, and fled with his young son, Demetrius, to Antipater. It does not appear that he took an active part in the short contest which ensued between the European and the Asiatic chieftain: but Antipater, on making a fresh distribution of the Asiatic provinces, added Susiana to Phrygia and Lycia, which Antigonos already held, (we find no mention of Pamphylia in the second division,) and declared him general of the king's forces in Asia, with a special commission to prosecute the war against Eumenes, one of Alexander's best officers, satrap of Paphlagonia and Cappadocia, who had espoused the party of Perdikkas, and still refused to acknowledge Antipater as protector. Antigonos gained a victory over him by bribing one of his chief officers to desert in the hour of battle. Eumenes, unable to keep the field, shut himself up in the strong fortress of Nora; and his antagonist, after drawing lines of circumvallation round him, and leaving a sufficient force to maintain the blockade, marched into Pisidia, and soon overthrew Alcetas, the brother, and Attalus, the brother-in-law of Perdikkas, the only persons except Eumenes now openly hostile to Antipater.

There is some difficulty in settling the chronology of this period, since Diodorus, as our copies now stand, passes at once from *n.c.* 322 to 319, omitting to mark the intervening years. But the expedition of Antigonos against Alcetas is placed by him in the latter half of 319; and his arrival in Macedonia may be determined to the beginning of 321, in which year Perdikkas died. If therefore we suppose that the winter of 321-20 was spent in arranging affairs upon Antipater's accession to the regency, and that Antigonos commenced his operations against Eumenes in 320, two years will be left for those operations, for the proceedings against Alcetas and Attalus, and for the siege of Nora, which ended after the death of Antipater, and therefore in the course of 318. This seems more time than these transactions require.

Antigonos, on hearing of the death of Antipater, began to attempt the establishment of an independent kingdom in Asia. For this undertaking he was qualified, not only by his talents and skill in war, in which he was inferior to none of the generals trained under Philip and Alexander, but also by the possession of four provinces and a powerful army of 60,000 foot, 10,000 horse, and 30 elephants, and by the commission of the late regent Antipater, constituting him general of the royal forces. This, in the unsettled state of affairs, might be considered almost as good a warrant as any derived from the son of Alexander by Roxane, who, under the tutelage of his grandmother Olympias, had now nominally succeeded Arrhidæus on the Macedonian throne. Considering it of high consequence to gain over Eumenes, he sent the most flattering invitations to that general, while still cooped up in Nora; and Eumenes so far assented to his terms as to take an oath of fidelity to him, conjointly with Olympias and the children of Alexander. Meanwhile he expelled the satraps of Lydia and Hellespontine Phrygia, or Mysia, from their provinces, and took possession of Ephesus, and of four ships laden with 600 talents of silver, on their way to Macedonia.

The state of things in Europe favoured his views. Cassander, son of Antipater, dissatisfied with the inferior station assigned to him by his father, sought, by the assistance of Antigonos, to supplant Polysperchon, and obtain the protectorate. This Antigonos readily promised, hoping that, while the attention of the government at home was distracted by these contests, he should easily establish his own power in Asia. But he found a formidable enemy in Eumenes, who was no sooner at large than a considerable body of his Cappadocian friends and followers collected round him; and receiving from Olympias and Polysperchon a large sum of money, with the command of 3000 of the *Argyraspidae*, or Silver-shields, a select body of Macedonian veterans, with the commission of imperial general in all Asia, he declared himself openly in support of the royal authority. He soon collected a strong army; but, unable to make head against Antigonos, he retreated through Cilicia and Coele-Syria into Babylonia, where he wintered in 317-6.

The following summer was spent by the contending generals in a series of marches in Persia and Media: Antigonos being supported by Python, satrap of Media, and Seleucus, satrap of Babylonia; Eumenes by the satraps of the upper provinces, as they were called, lying to the north, and towards India, who were united by a common fear of Python. After a doubtful campaign, closed by an indecisive battle, in which the fortune of war preponderated on the whole against Antigonos, the armies separated; Antigonos taking up his winter quarters at Gamarga, or Gadamaba, in Media, Eumenes in Gabiene. A district of nine days' journey separated the two. Crossing this by a forced march in mid-winter, Antigonos endeavoured to surprise the enemy; but his wary adversary was not off his guard. A pitched battle ensued, which in the critical moment was decided by the cowardice or treachery of one of Eumenes' officers, and on the next day that brave and faithful general delivered up bound to Antigonos by the Argyraspidæ. This completed the ruin of the royal party in Asia, which Eumenes alone upheld. (B.C. 315, early.)

Antigonos returned to Media, and went into winter-quarters near Ecbatana. He made a savage use of his victory, putting to death several officers whom he knew to be ill affected towards himself. Eumenes he retained some time in prison, earnestly desiring to secure his services; but finally apprehension, or the importunity of his Macedonian followers, prevailed on him to consent to that great general's death. His friends now began to experience how much more ambition weighed with him than gratitude. Python, satrap of Media, was sacrificed to his jealousy, another of the best and bravest of Alexander's officers. On quitting Media, he directed his march towards Susa; the citadel of which containing treasures stored there by Alexander, to the amount of 15,000 talents, was delivered up to him by order of Seleucus; in addition to which he had amassed 10,000 talents in gifts and valuable booty in Media and elsewhere. Returning towards the Mediterranean through Babylonia, he took occasion to quarrel with Seleucus, of whom he required an account of the revenues of his province. The Babylonian satrap declined to render it, alleging that he held the government as a free gift from the Macedonians, on account of his services during the life of Alexander; and indeed his title, and that of Antigonos, to their respective dominions, stood on the same ground. But finding that his dangerous ally would by no means admit this answer, and warned by the fate of Python, Seleucus fled betimes to Egypt; seeking to engage Ptolemy in a combination against Antigonos, who now aimed openly at uniting all the Macedonian conquests under himself.

Cassander, and Lysimachus, governor of Thrace, readily joined with Ptolemy and Seleucus to check the power of their dangerous rival; and in concert they sent demands which they could not expect to be granted, requiring him to resign Cappadocia and Lycia to Cassander, Hellespontine Phrygia to Lysimachus, Syria to Ptolemy, and Babylonia to Seleucus; and to divide with them the ample treasures which he had acquired in the war against Eumenes. Antigonos replied by menaces against Ptolemy, and prepared for the struggle. He sent ambassadors to gain Rhodes and Cyprus to his party, and dispatched Aristodemus the Milesian into Peloponnesus to raise soldiers, and cultivate the friendship of Polysperchon: who, having lately been the common enemy of Cassander and himself, was now united to him by their common jealousy of Cassander. Aristodemus succeeded in both his objects. Meanwhile Antigonos had been diligently employed in Phœnicia in building ships, the chief naval power of the Mediterranean being in the hands of his enemies. It is said by Diodorus that 8000 men were employed in felling and sawing timber in Mount Libanus: and Antigonos boldly declared, that before the summer was over, (B.C. 314,) he would command the sea with a fleet of 500 vessels. In that summer, the Rhodian fleet in his service had been defeated by Ptolemy's lieutenant on the coast of Cilicia; but this misfortune was more than counterbalanced by his success in Syria, where the strong cities of Joppa, Gaza, and Tyre fell into his hands. He then left his son Demetrius, surnamed Poliorcetes, or Taker of Cities, a young man of high promise, to command in Syria, and himself repaired to the western coast of Asia, in the winter of 314-3. During the next year, the greater part of Caria fell into his hands, and he was further occupied in exciting the Thracian tribes to aid Lysimachus and in forming a party in Greece against

Cassander. In that, and in the following year, most of Peloponnesus, Eubœa, Thebes, and the greater part of Phœcis and Locris, were gained to his alliance; and a prudent appearance of moderation in re-establishing, as independent states, the cities from which he expelled Cassander's garrisons, added greatly to the good feeling entertained towards him. These successes, however, were clouded by the ill-fortune of Demetrius, who was defeated by Ptolemy in a great battle at Gaza; in consequence of which the coast of Syria, as far as Sidon, returned into the victor's possession (B.C. 312, after midsummer). Seleucus, encouraged by this success of his ally, and trusting to his popularity among his former subjects, returned to Babylonia with only 2000 followers, and with that small force regained possession of his satrapy. From this time the æra of the Seleucidæ commenced.

Antigonos and his lieutenants were restored, partly by a victory gained by Demetrius over one of Ptolemy's lieutenants, and partly by his own return to Syria, upon which Ptolemy, unwilling to risk all in a pitched battle against so able a general supported by a superior army, fell back into Egypt. Antigonos then employed his son in a fruitless attempt to take Petra, the chief city of the Nabathæan Arabs. This place, of which a very curious and interesting account has been published by Captains Irby and Mangles, lies about fifty miles in a south-westerly direction from the southern end of the Dead Sea, and was then a caravan station and a great dépôt of Arabian merchandise: the hope of plunder seems to have been the chief object of the enterprise. Demetrius failed in this project, and also in an attempt to expel Seleucus from Babylonia, B.C. 311. A peace was concluded between Cassander, Lysimachus, and Ptolemy, on the one part, and Antigonos on the other, upon condition that Cassander should be president (*συνάρχης*) of Europe until the nominal king, Alexander, son of Alexander the Great by Roxana, attained his majority; and that the other parties should remain in possession of what they each had; and that the Grecian cities should be free.

We may here briefly trace the history of the royal family of Macedon up to this time. After Antipater's death, Polysperchon brought forward Alexander, the son of Roxana, supported by Olympias, as a rival to Arrhidaeus. Arrhidaeus fell into the hands of Olympias, who put him to death, B.C. 317. In the following year, Olympias being taken prisoner, together with Roxana and her son, suffered the same fate at the hands of Cassander, who retained the young king and his mother in close custody. On the conclusion of this peace, he added the murder of them both to the long list of flagrant iniquities which pollute this history, moved partly by the fear that the Macedonians would be inclined to favour the cause of Alexander's son, partly by the desire of obviating that article which provided that his own government should expire when the young prince came of age. Two only of the descendants of Philip now remained. Hercules, the son of Alexander by Barsine, (see ALEXANDER,) was brought forward by Polysperchon as a claimant to the crown; but his treacherous guardian was bribed to murder him by Cassander (B.C. 309). Somewhat later, Cleopatra, Alexander's sister, having engaged herself in marriage to Ptolemy, was secretly poisoned by Antigonos, who durst neither detain her forcibly at Sardes, her place of residence, nor was willing to let her go to Egypt, to strengthen Ptolemy by her claim to the succession. Thus was the house of Philip and Alexander cut off root and branch, not reaching even to the fourth generation, 'and it was extinguished by the hands of such as thought upon nothing less than the execution of God's justice, due unto the cruelty of these powerful, but merciless, princes. Wherefore the ambitious frames, erected by these tyrants upon so wicked foundations of innocent blood, were soon after cast down, overwhelming themselves or their children with the ruins, as the sequel will declare.' (Raleigh, *History of the World*.)

To return to the order of events: the alliance did not last more than a year, and Ptolemy was the first openly to break it, alleging that Antigonos had transgressed the conditions by interfering with the Grecian cities. During the years 310, 309, 308, hostilities continued, without any marked events, but somewhat to the disadvantage of Ptolemy. In June, 307, Demetrius, being sent to Greece by his father with a powerful fleet to set free the Grecian cities which were still held by Cassander, appeared before the Piræus, and having made himself master of that important place, was gladly entertained as a friend by the Athenians, to whom he guaranteed the independence of their state.

He completed their deliverance by besieging and demolishing the fortified port and suburb of Munychia, which the Macedonians had used as a citadel to hold Athens in subjection. He thus restored the democracy, fifteen years after it had been put down by Antipater, at the end of the Lamian war. Extravagant honours were paid to him and to Antigonus on this occasion. Gilded statues were erected to them near those of Harmodius and Aristogiton; golden crowns were voted to them; they were worshipped as deities; and two new wards were added to the ten existing ones, and called after their names. Demetrius also took Megara, which was held by Cassander; but he was hastily recalled to Asia, to make head against Ptolemy. He gained all Cyprus to his father's cause, first defeating Ptolemy's lieutenant by land, and then Ptolemy himself, who came with a great fleet to relieve the island, by sea, B.C. 306. On hearing of this great success, which was expected to bring forth more important consequences than the event proved, Antigonus assumed the diadem, the ensign of regal dignity in Persia, with the title of king, and his example was followed by Ptolemy, Lysimachus, Seleucus, and Cassander. In this year, Antigonus founded the city of Antigonía, in Syria, on the river Orontes. [See ANTIOCHIA.]

In the following year, 305, Antigonus invaded Egypt with a powerful army, both by land and sea, the fleet being commanded by Demetrius. But the mouths of the Nile were so strongly fortified, that no entrance could be forced by sea; the army could do nothing without the co-operation of the fleet; and Antigonus was obliged to return to Syria, with some loss, and no glory. In 304 he turned against Rhodes, which, after flourishing in a neutral state for several years, now found itself obliged to embrace his cause, or to defend itself by arms. The Rhodians resisted bravely, and though pressed by Demetrius with his utmost skill and vigour, held out for a year; at the end of which Antigonus required his son to make peace on the best terms he could with the besieged, and repair to Greece, where Cassander, during his absence, had regained much power. Demetrius found no difficulty in replacing things on their former footing. Cassander was driven beyond Thermopylae (B.C. 303), his garrisons were expelled from Sicyon, Corinth, and other important places, and Demetrius assembled a general council at the Isthmus, at which he was chosen captain-general of Greece. Cassander, alarmed at the turn which things were taking, endeavoured to conclude peace with Antigonus; but failing in this, he engaged Lysimachus, Ptolemy and Seleucus, who felt that if Antigonus should gain possession of Macedonia, their own safety would be endangered, to make a diversion by invading Asia Minor. This was done by Lysimachus, B.C. 302. Antigonus hastened to meet him, but could not force him to battle; and on the approach of winter, and the arrival of Seleucus from Upper Asia, the three kings went into winter quarters. In the spring, Antigonus recalled Demetrius from Greece. About August 301, the armies met at Ipsus, in Phrygia; they were well matched both in number and in the qualities of their generals, of whom, Lysimachus, Seleucus, and Antigonus, had all acquired experience and fame under Alexander, while Demetrius, though young, had gained high reputation in his varied services by sea and land. Antigonus had about 70,000 foot, 10,000 horse, and 75 elephants. The allied kings mustered 64,000 foot, 10,500 horse, with 400 elephants, and 120 armed chariots. Antigonus, grown old in arms and success, and commonly most cheerful before the hour of battle, is said on this occasion to have been haunted by apprehensions of misfortune. The battle was lost, owing in part to the impetuosity of Demetrius, who charged and routed Antiochus, the son of Seleucus; and pursuing him too eagerly, gave opportunity to Seleucus to interpose his elephants and cavalry between his own victorious division and the main body of his father's army. Antigonus fought bravely to the last, replying to those who counselled him to fly, 'Demetrius will come and help me.' He was slain, his army was routed, and Demetrius fled into Greece.

Thus perished Antigonus, at the age of 81, leaving the character of a brave, able, and successful soldier, a faithless, merciless, insatiable, and insolent man. His best qualities were to be found in the private relations of life, especially in his cordial affection and full confidence towards his heir Demetrius. The empire, which he had spent so much labour and blood to consolidate, was divided among the victors [see SELEUCUS], and his son, after experiencing

many revolutions of fortune, died in captivity. The fortunes of the house were partially revived in

ANTIGONUS GONATAS, so named from being born at Goni, or Gonnos (Strab. p. 440.), in Thessaly, son of Demetrius Poliorcetes. After the death of his father, there were various claimants to the Macedonian throne, which was finally seized by Ptolemy Ceraunus, to the exclusion of Antigonus (B.C. 281). Ceraunus was slain in battle against the Gauls. After the great overthrow of the barbarians in Thessaly, Antigonus defeated another division of them in Macedonia, and soon after gained possession of his paternal kingdom, B.C. 277, in spite of the opposition of Antiochus; whose sister, Phila, he soon after married. He was driven out of Macedonia by the celebrated Pyrrhus, king of Epirus, in 272, and fled into Peloponnesus, where, like his father, he possessed a powerful interest. On the death of Pyrrhus before Argos, in 271, he recovered Macedonia; but was again expelled by Alexander, son of Pyrrhus, and reinstated by his own son Demetrius. During the latter part of his life, he held his own dominions in peace; but he was continually employed in extending his influence in Peloponnesus, both by force and fraud, and was brought into frequent collision with the Achaean league. [See ARATUS.] He died B.C. 243, or 239 (Clinton), leaving a son, Demetrius II., who reigned ten years.

ANTIGONUS DOSON (about to give), so named, because his promises were more ready than his performance, is said to have been the son of a Demetrius, who was the son of Demetrius Poliorcetes, and of course the brother of Antigonus Gonatas. Being appointed guardian to Philip, the infant son of Demetrius II., he was called to, or usurped the throne, B.C. 229; but he acted the part of a kind of protector to Philip, who succeeded him. He enlarged the limits of the Macedonian monarchy, and took an important share in the affairs of Greece, for the most part in concert with Aratus and the Achaean league. [See ARATUS, and CLEOMENES.] He died B.C. 221 (Feb. 220, Clinton), regretted by the friends of Macedonia, and leaving a fairer character than belonged to most of the princes of that age.

ANTIGONUS CARYSTIUS, probably a native of Carystus in Euboea, is the reputed author of a work, intitled a *Collection of Wonderful Histories* (ἱστοριῶν θαυμάτων συλλογή). Antigonus is generally supposed to have lived in the age of Ptolemy II. of Egypt. This collection, which on the whole is of very little value, was last edited by J. Beckmann, Leipzig, quarto, with a commentary.

ANTIGUA, one of the Caribbee Islands. The town of Saint John, the capital of the island, is in 17° 10' N. lat., and 61° 57' W. long. Antigua was discovered by Columbus in 1493, and was named by him after the church of Santa Maria de la Antigua, in Seville.

The first settlement that was made on Antigua was by a few English families in 1632. Thirty years from that time the island was granted by Charles II. to Lord Willoughby; in 1666, it was invaded by a French force, which laid waste all the settlements. A few years afterwards Antigua was again settled by Colonel Codrington, who was appointed its governor, and whose family still possesses considerable estates on the island.

Antigua is about twenty-one miles long, and is nearly of the same breadth. The land in cultivation amounts to 59,623 acres. Rather more than half of this area is occupied by sugar plantations, the remainder being employed for raising provisions. In 1832, there were exported from the colony equal to 11,010 hogsheads of sugar, 7,342 puncheons of molasses, and 1238 puncheons of rum. A considerable quantity of cotton was formerly produced, but its cultivation is now discontinued. Two descriptions of soil are prevalent in the island: one a rich black mould on a substratum of clay; the other a stiff clay on a substratum of marl, which is not so fertile as the former description of soil. It contains a large proportion of level land, and is not in any part mountainous. The shore is in general rocky, and surrounded by dangerous reefs, which make it difficult to approach, but there are several excellent harbours, in one of which—English Harbour, situated on the south side of the island—is a dock-yard belonging to government, with every convenience for careening and repairing vessels: this harbour is capable of receiving the largest ships in the British navy, and here, during the war, the king's ships on the West India station were usually moored during the hurricane months.

The island does not contain a single river, and the few inconsiderable springs it has are so brackish, that the inhabitants are forced to collect rain-water, and preserve it in cisterns for domestic use. It was probably owing to this deficiency that Antigua was not inhabited by the Caribbs, the aborigines of these islands, and that the settlement of it by Europeans proceeded for a long time but very slowly. The island is now divided into six parishes, each of which has a town or village, and eleven districts. It contains six churches, the same number of chapels, and nine other places of worship belonging to Methodists and other dissenters. The Moravian United Brethren have an establishment on the island for communicating religious instruction to the slaves.

The town of Saint John, on the north-west side of the island, is built at the bottom of the bay of the same name, which is defended by a fort, and forms an excellent harbour. The town is on the side of a hill, and its streets are in some parts very steep. This town is considered to be one of the most healthy in the Leeward Islands: it is exposed to the sea-breeze, and from its situation is freed from all impurities by every shower that falls.

Willoughby Bay, on the south-east side, has its entrance much contracted by a reef, but is secure within, and affords good anchorage in four to five fathoms water.

On the north side of the island is the small town of Parham, built on the south side of a spacious harbour, which, however, has not depth of water sufficient for large vessels. A little island, called Prickly Pear, lies off the west point of the entrance to Parham Harbour. Falmouth Harbour is to the westward of English Harbour, already mentioned. The town of Falmouth is built on the western side of this harbour, which is defended by a battery on an islet within, and affords good anchorage in from three to six fathoms of water. Five Islands Harbour, on the western side of the island, is a large harbour so called from five remarkable islets, which lie nearly in a line from east to west about half a mile off the point on its south side.

The executive government of Antigua is vested in a governor, whose jurisdiction extends to the islands of St. Christopher, Nevis, Montserrat, and the Virgin Islands. Its legislature consists of a council nominated by the crown, and a house of assembly composed of twenty-four members, who are chosen by the freeholders of the island. The public revenue of the colony amounts to about 16,000*l.* per annum, and the value of its exports, which are principally made to Great Britain, amounts to about 300,000*l.*, employing between forty and fifty sail of shipping. Antigua has also a considerable trade with the neighbouring British and foreign colonies, in the prosecution of which trade upwards of 300 small vessels annually enter and leave the different ports of the island.

The population of Antigua comprises 35,714 souls, of whom 5875 are whites and free coloured people, and 29,839 are slaves. It contains nineteen schools, in which about 1200 children are educated. In seven of these schools, which are in the towns, about 500 pupils are instructed according to the National System. There are besides several Sunday schools, which are numerously attended; and nine estate schools in different parts of the country, where the children of slaves are taught to read. In the course of the last year (1832) two laws were passed in the colony of great importance to the black and coloured population: one of these is 'an act for relieving free coloured and black persons from all political restraints and disabilities, and for securing to them an equal and unqualified participation in all political rights and privileges;' the other is 'an act for declaring the evidence of slaves admissible in criminal courts of the island.'

Antigua is forty-four miles east of Nevis, twenty-five miles south of Barbuda, and about forty miles north of Guadalupe. (Purdy's *Colombian Navigator*; Alcedo's *Dictionary*; *Government Statistical Tables*.)

ANTILIBANUS. [See LIBANUS.]

ANTILITHICS. [See LITHONTRYPICS.]

ANTILLES, a term applied to portions of the West India islands, but with regard to its exact limitation geographers differ widely. Hoffman confines it solely to the Caribbean group, and says, 'they are called the Antilles of America (quasi ante insulæ Americæ), from lying in front of the larger islands of the Mexican Gulf.' Rochfort and Du Ferre explain the term nearly in the same manner; but D'Anville, qualifying it by the addition of the words

Greater and Lesser, applies the former to Cuba, Hispaniola, (or Hayti,) Jamaica, and Porto Rico, and the latter to Aruba, Curaçoa, Buen Ayre, Margarita, and others along the coast of South America, thus entirely excluding the Caribbean group. Some derive the term from the words Ante Ilas (Forward Islands): while others assert that, in maps constructed before the existence of a new continent was known, the name Antilla was assigned to a supposed country westward of the Azores, and that when Columbus first saw the Antilles he gave them that name in consequence. By a recurrence to the early Spanish historians, it appears at least that the word Antilla was applied to Cuba and Hispaniola previous to the discovery either of the Caribbean islands or the continent of America; thus Peter Martyr, who wrote his work in Latin only eight months after Columbus's return from his first expedition, says, 'he gives it out that he has discovered the island Ophir, but after carefully considering the world, as laid down by cosmographers, those must be the islands called Antillæ; this island (of which he is speaking) he called Hispaniola.' It is here proposed, however, to adopt the classification of Greater and Lesser, the former comprehending Cuba, Hayti, Jamaica, and Porto Rico; and the latter, all the Caribbean group, with those lying along the coast of South America. This definition of the term is now adopted by the best Spanish authorities.

With the exception of Hayti, which has established its independence, the islands are subject to the following European powers:—

GREATER ANTILLES.—*England*. Jamaica.

Spain. Cuba, and Porto Rico.

LESSER ANTILLES.—*England*. Antigua, Barbadoes, Barbuda, Anguilla, Dominica, Grenada, Grenadines, Virgin Islands (part), Montserrat, Nevis, St. Christopher, Saint Lucia, St. Vincent, Tobago, Trinidad.

Spain. Margarita, Testigos, Tortuga, Blanquilla, Orchilla, Rocca, Aves.

France. Guadalupe, Martinique, Marie Galante, All Saints, Desade, Saint Martin (north part).

Holland. Buen Ayre, Curaçoa, Aruba, Saint Martin (south part), Saba, Saint Eustatius.

Denmark. { Saint Thomas, } part of the Virgin Islands group.
{ Saint John, }
{ Saint Croix, }

Sweden. Saint Bartholomew.

Their geographical position is between 10° and 23° 30' N. lat. and between 59° 30' and 85° W. long.

These are again subdivided into windward and leeward, terms which are purely conventional, having necessarily local reference, and differing with different nations according to the position of their respective possessions. In English maps the Caribbean chain has generally been divided into two classes, the windward and leeward, but this distinction seems useless and improper, as, with reference to the trade-wind, the whole group constitutes the Windward islands, and under this appellation they are now commonly all included, while those lying along the coast of Colombia are called Leeward islands. In short, the Antilles is but another name for the West Indies generally, exclusive of the Bahamas; the term West Indies having been bestowed on them near the time of their discovery from the supposition of their belonging to the continent of Asia.

There is great difficulty in treating of the Antilles as a group, as they differ so widely in many respects: the Greater appear to be of primitive formation, with lofty granitic mountains, but most of the Lesser exhibit manifest proofs of their volcanic origin. Craters are still visible in some, though no volcanoes have been in active operation since their discovery. They are all subject to violent shocks of earthquakes, and there is scarcely one in which some memorial of disaster from this cause does not exist. The memorable earthquake which destroyed Lisbon, on the 1st Nov. 1755, was felt in these islands, the shock occurring four minutes later than at Lisbon.

Between August and the latter end of October, the islands, except Trinidad and Tobago, which lie farthest to the south, are subject to the most violent hurricanes; the fury of the wind on these occasions is inconceivable by those who have not witnessed it. Happily, however, these hurricanes are not of very frequent occurrence, and they are never experienced except during the short period of the year already mentioned. Were their visits more frequent, these fertile islands would soon be converted into deserts, since no one

would be willing to employ capital and labour for their cultivation when every moment might deprive him of the fruits of his industry.

The general aspect of this archipelago is mountainous: the summits of the elevated lands are sometimes pointed and naked, and sometimes rounded and wooded. The volcanic islands have isolated conical and pyramidal mountains, whose tops are often above the clouds: their surface is intersected with deep ravines and bristled with rocks; the soil is mostly argillaceous and watered by numerous streams. In islands of such an extent as the Greater Antilles, harbours exist on all sides; the coast of Cuba particularly is deeply indented with safe and landlocked ports. But among the Caribbean, the best and generally the only anchorages may be looked for in bays on the west or lee side; the greatest elevations are nearer the eastern shore, which is bold and precipitous and exposed to the whole force of the Atlantic current, setting through the various passages at the average rate of about a mile an hour; this current is more rapid towards the main, but decreases in velocity among the more northern islands. All the Antilles are more or less surrounded by, or interspersed with, coral formations of reefs or islets called cayos or keys, which render the navigation intricate and dangerous. There are some islands of calcareous formation, probably with a volcanic base; these present undulating plains, and do not attain half the height of the volcanic mountains: they are but scantily watered by small brooks, the soil is dry, with few trees, but the air is more salubrious. In the Antilles, moisture and heat combined produce a surprising luxuriance of vegetation: the soil is in general productive far beyond that of most parts of Europe, but in many islands it has been greatly impoverished by the short-sighted policy of the proprietors. These islands are infested with myriads of insects, mosquitos, sand-flies, &c., which are the cause of constant annoyance to the inhabitants.

The Caribbean islands have the appearance of a continuous chain; but with a line of 100 to 150 fathoms, which is the greatest length commonly used, except for scientific purposes, no bottom is found between the larger islands of the group, nor on either side east or west of them.

The year, as in most tropical climates, may be simply divided into two seasons, the *dry* and the *wet*, yet sufficient variation exists to mark the four seasons of more temperate regions. The spring may be said to commence with April, when a bright and beautiful verdure, with a rapid and luxuriant vegetation, make their appearance; and during the month of May, gentle showers (as compared with the autumnal rains) fall generally every day about noon and break up with thunder-storms. From May till October, the tropical summer reigns in full glory; and before the sea-breeze or trade-wind sets in, the heat is scarcely supportable. This refreshing wind, whose advance is visible over the sea for some time before it reaches the shore, begins between 10 and 11 in the forenoon, and blows with great regularity, increasing in force till about 3 in the afternoon, and then dies away entirely about sunset. The medium height of the thermometer at this season is about 80°. The nights are transcendently beautiful and tempered by a land-wind, which (especially in the mountainous islands) blows gently off the shore from about 10 till daylight. With October commence the autumnal rains, when the water literally pours down in torrents, from 60 to 65 cubic inches being about the medium for seasonable years, but at Barbadoes in 1754 no less than 87·1 cubic inches was ascertained to have fallen. This continues till the middle of December, between which time and April, which is in fact the winter, serene and pleasant weather prevails with a reduced temperature. The climate, more especially of the Greater Antilles, is justly considered unhealthy; the yellow fever rages as an epidemic with great violence, and carries off annually numbers of Europeans, nor do the native negroes themselves altogether escape its fatal effects.

Most of the islands produce sugar, coffee, and cotton; many tobacco and cocoa; and some indigo, lignum vitæ, pimento, &c., which, with rum and molasses, constitute their commerce with the mother countries; in return they take articles of luxury and plantation stores. The land is cultivated entirely by the labour of slaves, who form more than four-fifths of the whole population.

The Lesser Antilles have little communication with the other islands owing to the great difficulty of returning: indeed only very fast vessels can work their way back against

the wind and current. The intercourse between themselves is partly carried on in small vessels called droggers.

The islands under the British dominion have their own colonial governments, consisting of an elective legislative assembly, who enact all local laws for the internal regulation of their respective islands, subject, however, to the veto of a governor appointed by the crown. St. Lucia and Trinidad have no legislative assembly, but are administered by resident governors, acting under the orders of the Colonial Secretary in England. Those belonging to foreign powers are governed by the laws of the states to which they belong.

The tides are irregular and uncertain, varying much in the different islands; for instance, at Jamaica the rise is scarcely perceptible, amounting at the maximum to eight inches, while at Trinidad it reaches six feet. The flood sets to the eastward, but on the open shore its effects are counteracted by the current which sets through the whole group to the westward.

Having thus given a slight sketch of the general character and appearance of this archipelago, we refer to other parts of this work for a more particular description of the islands which compose the group. (Edwards's *History of the West Indies*; Purdy's *Colombian Navigator*.)

ANTILOGARITHM, as used in this country, means the number to the logarithm. Thus, in Briggs's system, 100 is the antilogarithm of 2, because 2 is the logarithm of 100. We have introduced this term, because the French *Encyclopædia*, followed by Dr. Hutton, have defined the word to mean what is more usually called the complement of the logarithm, viz., the remainder produced by subtracting the logarithm from the next higher term in the series, 1, 10, 100, &c. This is not the most commonly received meaning of the word in this country.

It is becoming usual to express the number to a logarithm by writing the logarithm in brackets. There is, however, another notation much more consistent with received symbols. In the same manner as $\sin^{-1}x$ stands for the angle whose sine is x , $\log^{-1}x$ should mean the number whose logarithm is x . Thus, we might write either

$$\log 100 = 2 \\ \text{or } 100 = \log^{-1} 2$$

ANTI-MILO. [See MELOS.]

ANTIMONY, a metal sometimes called *regulus of antimony* to distinguish it from *crude antimony*, the name by which the sulphuret is sometimes called. Antimony was probably known early in the fifteenth century; it occurs, though rarely, native, and is generally procured from the sulphuret, which is the only abundant ore of the metal. When this is heated in contact with iron, the sulphur, on account of its greater affinity for that metal, is separated by it from the antimony, which is consequently reduced to the metallic state. Thus procured, however, it is not pure, but it may be rendered so by mixing it, when reduced to fine powder, with about an equal weight of peroxide of antimony (antimonic acid): the oxygen supplied by this, during fusion, oxidizes and separates the metals mixed with the antimony, which then remains in a pure state.

The properties of antimony are as follows:—its colour is silver white, lustre considerable, and the fracture fine laminated when pure; but the antimony of commerce is broad laminated. When slowly cooled after fusion, it crystallizes in the octahedron or its varieties; it is brittle and easily powdered. Brisson states the specific gravity to be 6·702. Dr. Thomson, 6·436, and Hatchett found the antimony of commerce to be 6·712. When it is exposed to the air, this metal tarnishes, but does not oxidize; if kept under water it suffers no change; at a red heat it melts, and, according to Berzelius, when subjected to a white heat, it volatilizes and distils. Thenard, however, asserts that it is not vaporized even at an intense white heat.

Oxygen and Antimony may be combined in several modes and in different proportions, forming the protoxide or sesquioxide, the deutoxide or antimonious acid, and the peroxide or antimonic acid. If the metal be heated in the open air, it unites with oxygen, and the oxide formed rising in a white vapour, and condensing in brilliant white crystals, was formerly called *argentine flowers of antimony*. When the heat is raised to whiteness, and the metal suddenly stirred, it burns, producing the same oxide; when also steam is passed over ignited antimony in a tube, it is decomposed with explosion, oxide of antimony being formed. According

to Berzelius, the oxide of antimony obtained by the above processes consists of nearly

Three atoms of oxygen	$8 \times 3 = 24$	or	$1\frac{1}{2}$ atom	= 12
Two atoms of antimony	$64 \times 2 = 128$..	1 ..	= 64

Atomic weight 152 Combining weight 76

It is therefore a sesquioxide. The most convenient method of preparing this oxide is to dissolve sulphuret of antimony, reduced to powder, in muriatic acid; sulphuretted hydrogen is evolved, and a colourless solution of muriate or chloride of antimony is obtained; when water is added to this, submuriate of antimony is precipitated in the state of a very white powder, from which the muriatic acid may be separated by heating it in a solution of carbonate of potash. After washing and drying, a dingy white powder remains, which is the protoxide or sesquioxide in a state of purity. This oxide is insoluble in water, but dissolved by dilute nitric acid, and by strong nitric acid it is converted into antimonious acid. Muriatic acid also readily takes it up: the same effect is produced by bitartrate of potash, and the solution on cooling deposits octahedral crystals, which have been long known and employed in medicine under the name of *tartar emetic*, or *tartarized antimony*. It is soluble also in the alkalis, potash, soda, and ammonia; if the submuriate precipitated by water be mixed with potash, a portion of the oxide is dissolved, the greater part, however, diminishes rapidly in volume, and is reduced to a fine greyish crystalline powder, which is a neutral compound of the oxide and potash, and is but slightly soluble in water. It appears, therefore, that this oxide acts as a base with acids, and as an acid with some bases. It operates violently as an emetic, and though now seldom used as such by itself, it is the basis of all emetic antimonial preparations.

Antimonious Acid. This acid, sometimes called *deutoxide of antimony*, may be procured by oxidizing antimony by acting upon it with nitric acid, this yielding oxygen: the mass is to be evaporated to dryness and calcined. Its colour is white, but it is yellowish when hot. According to Berzelius it is composed of nearly

Two atoms of oxygen	$8 \times 2 = 16$
One atom of antimony	= 64

Atomic weight 80

This acid is neither fusible nor volatile at a red heat: the only change which it suffers by it is that of being less soluble in acids, and combining less readily with bases. When heated with charcoal, it is not easily reduced to the metallic state as the oxide. Its saline compounds are termed *antimonites*, as antimonite of potash, &c.: if it be fused with this alkali the salt formed dissolves in water, from which the acids throw down a white precipitate of antimonious acid, combined with water: in this state it reddens litmus paper, like other acids, but if the water, which amounts to 5.26 per cent., be expelled by heat, it no longer acts as an acid upon vegetable blues. It is insoluble in nitric acid, but slightly dissolved by concentrated sulphuric acid. The antimonites are not an important class of salts.

Antimonic Acid is the peroxide of antimony. This acid is prepared by heating powdered antimony in aqua regia: the solution is to be evaporated to dryness, and the residue treated with nitric acid; it is to be again heated, but not to redness, to expel the nitric acid. The antimonious acid then remains in the form of a pale yellow powder. It is composed of nearly

Five atoms of oxygen	$8 \times 5 = 40$	or	$2\frac{1}{2}$ atoms	= 20
Two atoms of antimony	$64 \times 2 = 128$..	1 ..	= 64

Atomic weight 168 Combining weight 84

Its action on the animal economy is but slight. Antimonic acid is precipitated by water from solution in aqua regia, in the state of white hydrate, and when thus combined with water, it acts like other acids upon vegetable blues. The water amounts to 5.09 per cent., and is expelled by a gentle heat; the acid then becomes yellow and ceases to redden vegetable blues. This acid may be procured by detonating a mixture of one part of powdered antimony with four parts of water added to the residue dissolves the antimonite of potash formed, and nitric acid poured into the solution combines with the potash and precipitates the acid in the form of hydrate.

Antimonic acid is tasteless and insoluble in water: it does not decompose the alkaline carbonates in the moist way, but when heated with them it combines with the alkali and expels the carbonic acid.

When antimonic acid is subjected to a strong red heat, it loses oxygen and is reduced to antimonious acid, like which, it has but little medicinal power. Neither antimonic acid nor the antimonites are much employed.

Neither nitrogen, hydrogen, nor carbon combine with antimony.

Chlorine and Antimony unite to form two compounds, viz., the proto or sesqui-chloride and the perchloride.

The sesquichloride has long been known under the name of *butter of antimony*; it may be prepared by mixing one part of antimony with two parts of bichloride of mercury (corrosive sublimate) and subjecting the mixture to heat in a retort. By the action of the heat the antimony takes chlorine from the mercury, and the chloride of antimony being volatile distills and has the following properties:—it is a soft and nearly colourless solid; at a moderate heat it liquefies, and it absorbs moisture from the air: when mixed with water it suffers decomposition, and the results are, muriatic acid, the greater part of which remains in solution, and a white powder, which is a compound of protoxide of antimony and a small portion of muriatic acid: it is the submuriate of antimony, formerly employed in medicine under the name of *pulvis Algarotti*. It is dissolved by strong muriatic acid: and by nitric acid the protoxide of antimony is converted into antimonious acid. It has been already mentioned, that when this submuriate is heated with a dilute solution of carbonate of potash, the muriatic acid is separated and protoxide of antimony remains. The same chloride may also be procured by throwing powdered antimony into a jar containing chlorine gas: the antimony burns during combination with the chlorine.

It appears to be composed very nearly of

Three atoms of chlorine	$36 \times 3 = 108$	or	$1\frac{1}{2}$ atom	= 54
Two atoms of antimony	$64 \times 2 = 128$..	1 ..	= 64

Atomic weight 236 118

Perchloride of Antimony is formed by passing dry chlorine gas over heated antimony. The antimony burns vividly, and a volatile liquid distills which is the perchloride of antimony. It is a colourless or slightly yellow fluid, has a strong disagreeable smell, and emits white fumes. It attracts moisture from the air, and when mixed with water it is decomposed, and converted into muriatic acid and antimonious acid. It is composed of

Five atoms of chlorine	$36 \times 5 = 180$	or	$2\frac{1}{2}$ atoms	= 90
Two atoms of antimony	$64 \times 2 = 128$..	1 ..	= 64

Atomic weight 308 154

Bromine and Antimony form bromide of antimony; these substances combine with the evolution of light and heat, and the compound, being volatile, is easily procured by distillation. At common temperatures it is solid, colourless, crystallizes in needles, attracts moisture from the air, and is decomposed by water. It melts at about 206° Fahrenheit, and boils at 518°. It is composed of 64.3 of bromine and 35.7 of antimony. Iodine also combines with antimony to form an iodide: it consists of 74.7 iodine, and 25.3 antimony. But neither this nor the bromide is applied to any use.

Sulphur and Antimony combine to form several compounds: the first to be noticed is a native compound, frequently called *crude antimony*, which is the principal ore of the metal. It is found in many parts of the earth; it is of a lead grey colour, possessing considerable splendour, and is met with compact, in acicular crystals, and in rhombic prisms of considerable size and variously modified: when it is heated in close vessels, it melts without decomposition and crystallizes in striated masses. It is decomposed by nitric acid, which, when strong, converts the antimony into antimonious acid, and when dilute into protoxide. Muriatic acid, when concentrated and hot, decomposes it, dissolving the antimony and evolving sulphuretted hydrogen gas of great purity. It appears to be composed of

Three atoms of sulphur	$16 \times 3 = 48$	or	$1\frac{1}{2}$ atom	= 24
Two atoms of antimony	$64 \times 2 = 128$..	1 ..	= 64

Atomic weight 176 88

It is therefore a sesquisulphuret. It is much employed in preparing metallic antimony, glass of antimony, crocus of antimony, James's powder, and some preparations in the London and other pharmacopœrias.

The sesquisulphuret of antimony may be formed artificially by fusing together a mixture of sulphur and antimony; it has the colour and lustre of the native sulphuret. When also a current of sulphuretted hydrogen gas is passed into a solution of antimony, of tartar emetic for example, an orange precipitate is thrown down, which appears to be a compound of sulphuret of antimony and water: and when the water is expelled, it has the usual appearance of sulphuret of antimony. It may be here observed that the formation of this coloured precipitate is highly characteristic of the presence of antimony.

It appears from the experiments of Rose, that a bisulphuret of antimony may be formed by passing sulphuretted hydrogen gas into a muriatic solution of antimonious acid: and also a persulphuret, by the action of sulphuretted hydrogen upon antimonie acid. These, however, are unimportant compounds.

Sesquisulphuret of antimony is soluble in a hot solution of potash or soda: on cooling, an orange red substance is deposited, called *Kermes mineral*: this was formerly much used in medicine. When an acid is added to the remaining cold solution, a further portion of a similar precipitate is formed: this is sometimes called the *golden sulphuret of antimony*, and in the *London Pharmacopœia*, *sulphuretum antimonii præcipitatum*. These substances appear to consist of sulphuret and protoxide of antimony combined with water.

The only salt of antimony, strictly speaking, of any great importance, is the double tartrate of potash and antimony, usually termed tartar emetic, or tartarized antimony,—the *antimonium tartarizatum* of the *London Pharmacopœia*. Various processes have been proposed for preparing it: the London College directs *glass of antimony* (which is the protoxide of the metal, mixed with some sulphuret and silica, prepared by roasting sulphuret of antimony) to be boiled in water, with an equal weight of bitartrate of potash (cream of tartar). The excess of acid in this salt dissolves the protoxide, and a double tartrate of potash and antimony is formed, which crystallizes in octahedrons. Of all the preparations of antimony this is the most valuable. According to Dr. Thomson, it consists of one atom of tartrate of potash = 111, one atom of bitartrate of antimony = 218, and two atoms of water = 18: its atomic weight is consequently 350. The Pharmacopœrias also contain a preparation in imitation of James's powder, called *pulvis antimonialis*; they are both inert mixtures either of antimonious or antimonie acid and phosphate of lime.

Antimony is susceptible of combining with all metals. It makes them very brittle; and this is especially the case with gold, a thousandth part of antimony rendering it unfit for the uses to which it is generally applied.

The principal alloys of antimony are that with lead, employed as *type metal*, and the alloy of antimony and tin, used for plates on which music is engraved.

ANTIMONY (MEDICAL USES OF). Though the introduction of antimony into the number of medicinal agents was very violently opposed, and even decrees by the Parliament of Paris were passed against its use, it is now justly regarded as a most valuable remedy in many diseases. As antimony cannot produce any effect on the human system, unless when so prepared as to be capable of decomposition by the fluids of the body, the tartarized form, being the most soluble, has properly superseded the others. Its action varies according to the dose, the mode of administration, and the state of the system when it is exhibited. In very small doses, it seems to increase the activity of the function of secretion, particularly of the mucous membranes; hence it occasions a flow of thin fluid from these surfaces, which form the inner lining of the lungs, and intestinal canal; and also an increased action of the skin, and flow of perspiration, if the patient be kept warm. In a larger dose it causes vomiting, with all the phenomena of that action; and from being commonly employed for this purpose, it is designated *Emetic Tartar*. Compared with other emetics it may be said to be distinguished by the ease with which it causes vomiting, as well as by the certainty, though, in this latter respect, it is surpassed by sulphate of zinc (white vitriol). It may be given to persons of any age, except to very young children, for

whom ipecacuanha wine is preferable. It ought not to be given in cases of poisoning, for reasons stated under the head ANTIDOTES, and least of all should it be given in cases of narcotic poisons, since in large doses it is itself a poison, unless vomiting take place; and as, by narcotic poisons, the sensibility of the stomach is so lowered or destroyed as not to occasion the rejection of anything received into it, the impropriety of exhibiting tartar emetic in such cases is manifest. From the extremely small quantity of this substance which is sufficient to occasion vomiting, there is one state in which it is to be preferred to every other means of causing vomiting. By whatever channel tartar emetic is introduced into the system, it invariably excites the stomach to perform the act of vomiting, unless the person be in a state of insensibility or coma; a solution of two grains of it, in three ounces of warm distilled water, may, by a skilful operator, be injected into a vein, when the gullet is obstructed by any extraneous body lodged in it. In the same way it may be sometimes tried in tetanus, or lock-jaw, when the teeth are so firmly clenched together, that nothing can be made to pass them.

As tartarized antimony is decomposed by most bitter or astringent vegetables, which contain tannin, (except oak-bark,) and an insoluble, and consequently an inert, tannate of the protoxide of antimony is thereby produced, such vegetables, in the form of infusion, decoction, or tincture, furnish the best antidote in cases of over-dose, or poisoning by this article, should it not, by inducing vomiting, prove its own antidote. Under these circumstances, we should administer decoction or tincture of yellow cinchona bark, or, when these cannot be easily procured, a strong infusion of tea.

Employed in appropriate doses, its action as an emetic is seldom violent, while it certainly acts more powerfully than other emetics in promoting the secretion of the fluids of the stomach, as well as of the bile and pancreatic juice, with those of the lungs, and indeed all the secretions external as well internal. Now, as the suppression of the secretions is one of the most common occurrences in the early stage of fever, and the restoration, and improved character of these, one of the most favourable signs of its abatement, antimony is employed with great advantage in the treatment of fever, and it cannot be used too early. Indeed many a fever is stopped or prevented by the employment of this or some other emetic, as ipecacuanha, upon the first intimation of the disease being

It is also suited to the beginning of each paroxysm of intermittent or remittent fevers (see AGUE). It may also be advantageously given about the period of the expected crisis in continued fever. When the disease is of a highly inflammatory type, it should be combined with, or followed by, saline medicines, but when there is great depression of the vital powers, as in typhus, the salines must be soon laid aside, and stimulating medicines cautiously substituted.

Antimony is also used in some eruptive or exanthematous fevers, such as measles and scarlet fever, being less suited for those in which the eruption is of a vesicular or pustular character, and which affect the deeper layers of the skin. (See Craigie's *Pathological Anatomy*.) Antimony is well suited for rheumatic fever and erysipelas, as in these diseases the liver is deranged, and furnishes an unhealthy biliary secretion. It is also useful in what are sometimes termed mucous and bilious fevers, which are attended with very depraved secretions from the intestinal canal, which may be removed and improved by repeated small doses of an antimonial.

It is also in daily use for the cure of catarrhal affections, i.e. colds affecting the mucous membrane of the lungs.

Tartrate of antimony, when intended to act as an emetic, is generally given in the dose of a quarter or half a grain dissolved in distilled water, and repeated every ten or twenty minutes till vomiting occur; but when merely intended to cause nausea, or to act gently on the secretions of the intestinal canal, of the lungs or that of the skin, it is given in even smaller doses, and at the interval of two, four, or six hours. Lately, however, a mode of employing it in much larger and more frequent doses has been practised with marked benefit in several diseases of an inflammatory character, particularly in pneumonia, or inflammation of the lungs. According to this plan, from two to three grains dissolved in water, are given, and repeated every two hours or so, for a considerable time, even for two or three days. The early doses cause vomiting and purging, but these effects soon cease to appear, while the pulse is found to

have fallen to fifty beats, or even less, in a minute. When pursued with caution and managed skilfully, it often enables us to overcome the disease; and to dispense with the removal of so much blood from the system, as might otherwise have been necessary. It ought not to be tried, however, if the mucous membrane of the stomach be in a state of irritation or subacute inflammation, a condition which often occurs during pneumonia. This state of the stomach must be removed by general or local means before we venture upon the exhibition of the antimony.

This plan of administering tartar emetic is generally believed to have originated with the Italian physicians Rasori and Tommasini; but whatever merit it possesses is justly due to Dr. Marryat of Bristol, who proposed it in 1790, many years before its employment in Italy.

Tartrate of antimony is applied externally as an ointment and plaster: and in either way it excites an action of the part, leading to the formation of a vesicular eruption, similar to that of vaccinia or cow-pox; and it is consequently used as a means of counter-irritation, often with great advantage. The ointment and plaster may be prepared of different degrees of strength, but care must be taken not to make them too strong, as the antimony may be absorbed from the ulcerated surface, and produce violent vomiting, which in some cases has been so serious as to cause death.

ANTINO'MIANS, from the Greek, signifies *against the law*. It is applied by theologians to those, if any there be, who hold that faith in Jesus Christ dispenses with, and renders unnecessary, so far as a future state is concerned, the observance of morality and the performance of good works. We say, if any there be, because there is reason to suppose that the accounts of earlier antinomians contain much exaggeration, and that there never was any body of men, worthy to be called a sect by numbers and duration, which professed the above opinion.

So far as avowed abandonment of morals, we find various antinomian sects in the first three centuries; but the name was first applied to the followers of John Agricola, a townsman and contemporary of Luther, born at Isleben in Saxony. His opinions had the tendency above mentioned, and were attacked by Luther, who, with the assistance of the elector of Brandenburg, obliged him to publish a retraction. It must, however, be observed, that Bayle points out (in the article *Ischbiens*) the exaggerations which have been made of Agricola's opinions and their source, and that Agricola himself was employed with others in drawing up the *Interim*, a provisional confession of faith, promulgated by the emperor Charles V., at Augsburg, in 1548, which Dupin (and catholic writers are, in general, fair judges between one protestant and another) admits to be perfectly orthodox on the article of justification.

This sect has obtained very little notice from continental writers, and its followers appear rather to have been distributed among other persuasions. The assembly of divines in 1643 condemned several writings which appeared to them antinomian; and the parliament in 1648, in what ought to be called the Presbyterian persecution act, among other provisions, enacted that any one convicted, on the oaths of two witnesses, of maintaining that the moral law of the Ten Commandments is no rule for Christians, or that a believer need not repent or pray for pardon of sin, should publicly retract, or, on his refusal, be imprisoned till he found sureties that he would no more maintain the same.

The little importance of this sect renders it unnecessary to dwell further upon its history; but as the name, like others, is bandied about as a term of reproach by many who do not understand its meaning, we cite from an old English account of sects some of the peculiar opinions which were called antinomian by the orthodox, before the revolution of 1688. The source of the whole is the List of Heresies of Pontanus; certainly not a work to trust to in any other respect than as shewing what opinions it pleased some to attribute to others.

Pansebeia, &c., by Alexander Ross, sixth edition, 1653. 'The antinomians are so called from their opposing and rejecting of the law, which they say is of no use at all under the Gospel, neither in regard to direction, nor correction, and therefore ought not to be read or taught in the church. They say that good works do neither further, nor evil works hinder, salvation. That the child of God could no more sin than Christ could, and therefore it is sin in him to ask pardon for sin. That murder, adultery, drunkenness, are sins in the wicked, but not in the children of grace, nor

doth God look upon them as sinners, and, consequently, that Abraham's lying and dissembling was no sin in him. That no man should be troubled in his conscience for any sin. That no Christian should be exhorted to perform the duties of Christianity.'

ANTINOUS, a native of Bithynia, and favourite of the Emperor Hadrian, the extravagance of whose attachment was shown by the institution of divine honours to Antinous after his death. Respecting the circumstances of his death there are many stories, but it seems generally agreed that he was drowned in the Nile while Hadrian was in Egypt. The town near which he died was rebuilt by the emperor, and called *Antinoe* or *Antinopolis*, instead of Besa, its former name. Its remains exist under the name of Ensené. A new star was said to have been discovered in the heavens, which was called the *soul of Antinous*. Oracles were delivered by him, which must be taken as forgeries invented by Hadrian himself, or according to his order. That courtiers should have lent their countenance to this absurd and profane homage, in compliment to their master's weakness and blind partiality, may easily be credited; but that the worship of this new divinity should have outlived the prince who established it, when no longer enforced either by interest or fear, can only be accounted for by the stubborn credulity of a people over whom superstition had gained the ascendancy. It still prevailed in the time of Valentinian; but it was turned to account by the fathers of the Christian church, to whom it furnished an argument against the pagan system of worship, and the means of exposing the absurd principles of their religion. Among the remaining treasures of ancient sculpture, the statues of Antinous, nearly as numerous as those of the Venus, and very similar to each other, rank among the most beautiful. That originally in the collection of Cardinal Alexander Albani, the most perfect perhaps of those executed for the Roman nobles, for the purpose of paying their court to the emperor, is a standing figure in marble. The head looks downwards, with a melancholy expression, which they all bear: the hair in all of them is arranged in the same manner, covering the forehead nearly as low as the eyebrows. The busts of Antinous are also very fine. (See Xiphilinus; Bayle, *Dict. Hist.*, and the authorities there quoted; also Winkelmann, ii. p. 464, &c. French trans.)

ANTINOUS (CONSTELLATIONS). [See AQUILA.]

ANTIOCHET'Ä (*Ἀντιόχεια*), commonly called Antioch, and Antaki, or Antakieh, a town in Syria on the left bank of the Asy, the antient Orontes, 36° 12' N. lat., 36° 12' E. long., forty-six geographical miles west of Haleb (Aleppo), and twenty-two due south of Scanderoon or Alexandretta on the gulf of the same name.

[Silver, Brit. Mus.]

Antioch belongs to the Pashalik of Haleb. It stands in the valley of the Orontes, which here forms a fertile plain, about ten miles long and five or six broad (Brown). On the west side of the river is part of the mountain-range of Amanus, and on the east, to the south of Antioch and bordering close upon it, is the northern termination of the mountains called Jebel Akra, the antient Casius. The river at Antioch is from 100 to 150 feet wide, and is crossed by a substantial bridge. The Orontes in antient times was navigated up to the city, a distance of about twenty geographical miles from its mouth, and might again be made navigable for sailing boats if cleared out below. A large part of the immense walls of antient Antioch still remain, but authorities vary as to the circuit enclosed by them. Mr. Buckingham gives them a circuit of nearly four miles; but this is much less than the amount assigned by antient authorities. They run along the river on the N.W., ascend the steep hill on the S.W., on the S.E. run along its summit, and on the N.E. run down the hill to the river. The walls are from thirty to fifty feet high, fifteen feet thick, and flanked by numerous square towers. It seems not unlikely, from the quantity of Roman tiles found in the towers, and the mode of their disposition,

that the existing walls of Antioch are chiefly Roman work : possibly there are but few parts of the original walls erected under the Seleucids. It appears indeed most probable that the present walls are those which were erected by Justinian, after the town had been ruined by the Persians. Mr. Buckingham says that one portion of the wall and towers in the S.W. quarter is perfect.

Antioch, though fallen from its ancient importance, is still one of the large towns of Syria: the population is stated at about 10,000, but it does not appear to be well ascertained. It has no good public buildings. The houses are chiefly built of stone, pent-roofed, and covered with red tiles. The streets are narrow, with a raised pavement on each side for foot passengers. The bazars are numerous, and contain a good supply of such articles as are in demand in the country about Antioch. The manufactures of the place are coarse pottery, cotton cloth, silk twist, leather, and saddlery. The language of the Mohammedans at Antioch is generally Turkish; there are a few Christian families there, and some Jews. The air of Antioch is reputed to be more salubrious than that of Haleb. The view of the plain of Antioch from the towers above is described as highly interesting: 'The northern portion within the ancient walls is now filled with one extensive wood of gardens, chiefly olive, mulberry and fig trees; and along the winding banks of the river, tall and slender poplars are seen.' (Buckingham.) The chief street seems to have run from S.W. to N.E.: following its direction towards the *Bab Boulous*, or 'gate of St. Paul,' which leads to Aleppo, a part of the ancient pavement is observed, and on the right of the road within the enclosure, are numerous caves or excavations in the hill, which appear to have been the ancient Necropolis or cemetery. The remains of an aqueduct exist to the south of the city.

Antiocheia was founded by Seleucus Nicator, and received its name from his father Antiochus. Antiochia, which Antigonus had previously built near the site of the future Antioch, sunk into insignificance and disappeared before the city of Seleucus. Antioch became the residence of the Syrian monarchs, and one of the largest cities of the world. It probably grew still larger under Roman dominion, when it was the residence of the governor of Syria, the seat of pleasure, and the centre of an extensive commerce. Strabo (p. 750) describes Antioch in his time as consisting of four distinct quarters, each having a wall of its own, and the whole surrounded by a common wall. These quarters marked the successive additions that the city received from the time of Seleucus the founder to Antiochus Epiphanes. The geographer says it was little inferior in extent and wealth to Seleucia on the Tigris and Alexandria in Egypt. Several of the Roman emperors were fond of spending some time here, in a city where the games of the circus and the amusements of the theatre were so much cherished by the prevailing taste of the inhabitants. Under Libanius, a native of the place, it became in the fourth century a celebrated school of rhetoric. But before this period Antioch had also become the chief station of the Christian religion, which had been firmly established here by Barnabas and Paul; and here we are told (Acts xi. 26) that the name of Christians was first given to the disciples.

Antioch continued to be a city of great importance, notwithstanding the frequent and terrible visitations of earthquakes, till Chosroes, the Persian, took it and nearly levelled it with the ground. It was rebuilt by Justinian and again became a considerable place, and continued so till the time of the Crusades, to which epoch some assign the remains of a wall or fort on the hill to the south of the city. Antioch, after it was taken by the Crusaders under Godfrey and Boermond, (A.D. 1098,) became a Christian principality under the European conquerors of Syria. The sultan Bibars, in 1269, took it from the Christians and destroyed its churches. It afterwards passed under Turkish dominion, but has never recovered its commerce and importance, which were transferred to Aleppo. Mr. Buckingham says that the Christians of Antioch have not at present a single church, and that they assemble for prayer in one of the excavations mentioned above. Antioch was taken possession of by Ibrahim Pacha Aug. 1, 1832, but was subsequently restored to the Porte.

The neighbourhood of Antioch is peculiarly rich in medals and engraved stones: great numbers have been collected at different times after the earth has been laid bare by heavy rains in winter. The most interesting are those of the Seleucids, and next to them, those of the period of

Julius Cæsar and Augustus: one, of the date of Augustus, is given at the head of this article. Phœnician coins are also found in great quantities.

The last great earthquake at Haleb, in 1822, extended also to Antioch and did some damage. (See Strabo; Mannert's *Syrien*; Brown's *Travels*; Buckingham's *Travels among the Arab Tribes*; *Journal of Education*, No. II., p. 249; *Itinéraire*, &c. Paris, 1816, without the author's name.)

To the north-east of Antioch is a small lake, called Antakieh or Bahr Agoulé, which communicates with the ORONTES.

ANTIOCHEIA of Pisidia, a town of Asia Minor, where Paul, accompanied by Barnabas, preached the Gospel (Acts xiii.) It seems, that at this time Antioch had some Jews among its population. The position of this town is not accurately known, unless it has been very lately discovered, as some journals inform us. (See Strabo, p. 577.)

ANTIOCHUS, a name best known from its being borne by many Syrian monarchs of the Seleucid dynasty; but otherwise not uncommon in ancient history. We shall devote this article to giving a brief sketch of the history of the Syrian empire under these princes.

I. ANTIOCHUS, surnamed Soter, or Preserver, was the son of Seleucus Nicator, who after the death of Alexander raised Syria into an independent kingdom (see ANTIGONUS). There is a romantic story told, how he fell desperately sick for love of Stratonice, his father's young wife, the daughter of Demetrius Poliorcetes; and how Seleucus, on learning the cause of his son's disease, resigned her to him, and caused them to be crowned king and queen of Upper Asia.

[Silver, Brit. Mus.]

Upon the murder of Seleucus, while engaged in his expedition to subdue Macedonia, B.C. 280, Antiochus succeeded to the throne and reigned nineteen years, during which few events of much importance occurred. He prosecuted his father's claim to the kingdom of Macedonia against Antigonus Gonatas, son of Demetrius, and his own brother-in-law; but the dispute was accommodated by a marriage between Antigonus and Phila, daughter of Seleucus and Stratonice, in consideration of which the Macedonian prince was allowed to retain the peaceable possession of his throne. Demetrius, the son of Antigonus, also married Stratonice, the daughter of Antiochus. The reign of Antiochus is distinguished by his wars against the Gauls, who had crossed into Asia and obtained a settlement in the province named after them Galatia. Issuing thence they harassed the neighbouring provinces with predatory excursions, until Antiochus defeated them, and obtained the appellation of Soter. He was subsequently engaged in an unsuccessful war with Eumenes, king of Pergamus. Returning to Antioch he found, or took, occasion to put to death one of his sons charged with having excited disturbances in his absence: the other, named also Antiochus, he proclaimed king of Syria. He died soon after, B.C. 261. (Appian, *Syriaca*; Justin, book xxvii.; *Anc. Univ. Hist.* vol. viii.)

II. ANTIOCHUS, surnamed Theos, or God, son of the former, succeeded to the throne upon his father's death. His reign is chiefly memorable for the revolt of the Parthians, B.C. 250, under Arsaces, who succeeded ultimately in expelling the Macedonians, and thus became the founder of the formidable Parthian empire. The remote province of Bactria, and others lying eastward of the Tigris, followed this example: and Antiochus, apprehensive of the final loss of those regions, concluded a treaty of peace with Ptolemy Philadelphus, B.C. 252, by which he agreed to repudiate his wife Laodice, and to marry Berenice, daughter of the king of Egypt, settling the crown upon his children by the latter. These conditions were fulfilled: but on the death of Ptolemy, two years afterwards, Antiochus restored Laodice

to her conjugal rights, and in return was poisoned by her, B.C. 217, with the view of securing the succession to her eldest son, Seleucus Callinicus. He left another son by her, Antiochus, surnamed Hierax, the Hawk: who for several years waged war with his brother Seleucus for the possession of Asia Minor, but being finally overthrown, was forced to fly into Egypt, where he died. (See Schlosser's *Remarks on the Reign of Antiochus II.*, *Universalhistorische Uebersicht*, &c.)

III. ANTIOCHUS, surnamed the Great, was the son of Seleucus Callinicus, and succeeded his brother Seleucus Ceraunus, B.C. 223, who was poisoned by two of his chief officers, while engaged in war with Attalus, king of Pergamus. Antiochus owed his safety and his throne to the honesty of his cousin-german, Achæus: who, though pressed by the army to assume the crown, retained it in obedience to the legitimate heir, and by his good generalship kept Attalus in check. The first care of the young king, or his advisers, was to appoint governors to preside over the several districts of the Syrian empire, which during preceding reigns had lost much of its original greatness. The kingdom of Pergamus had especially profited by the weakness of the Seleucid dynasty: but under the able management of Achæus, those provinces which had been wrested from the Syrians were recovered, and Attalus was again confined within the limits of his proper kingdom. Antiochus was less fortunate in the choice of Molo and Alexander, two brothers, who were appointed governors of Media and Persia. Trusting to the weakness of a youthful reign, they endeavoured to raise their provinces into independent kingdoms, B.C. 221: and it was not until they had defeated two armies sent against them under subordinate officers, that they were reduced by Antiochus in person, in the second campaign.

Returning into Syria, he found abundant matter to engage his attention. Achæus, who had formerly so signalized his fidelity, now found that his distinguished successes had excited jealousy, and that plots were laid against his life by those who were in the king's confidence. Sacrificing his sense of duty to his personal safety, he proclaimed himself king of those provinces in Asia Minor, which he had recovered, and which had been entrusted to his charge. Thus slain on the west, the Syrian empire was equally mutilated on the south, where Ptolemy Philopator still held Coele-syria and Palestine, which had been conquered by his predecessor, P. Evergetes. By the advice of his council, the young monarch turned his arms first against Egypt. He marched into Coele-syria, and assisted by the defection of Theodotus, the governor of that province, gained possession of the greater part of it, including the capital, Damascus. The campaign was terminated by a truce for four months, to which the contending parties were induced to agree: Antiochus, by the necessity of returning northwards to oppose Achæus, who, not satisfied with his possessions in Asia Minor, aimed at extending them to the eastward of Mount Taurus: and Ptolemy, by the reverses which he had suffered, and the necessity of gaining time to prepare for fresh exertions. Negotiations for a treaty of peace were set on foot: but each party claiming Coele-syria and Palestine, in virtue of the partition of Alexander's conquests made after the battle of Ipsus, (see SELEUCUS) the truce expired before anything was agreed to. War was resumed, B.C. 218. At first, Antiochus carried all before him: he penetrated into Phœnicia, forcing the passes of Mount Libanus; gained possession of Galilee, and subdued the inheritance of the tribes beyond Jordan. But these advantages he lost in the following year in a great battle fought at Raphia, near Gaza, in which he was defeated with great slaughter, and obliged to retreat to Antioch with the wreck of his army. Coele-syria and Palestine returned to their allegiance to Ptolemy: and the Syrian king, pressed at the same time by Achæus, was compelled to sue for peace with Egypt, which he obtained on condition of resigning his claim to the contested provinces. Being now at leisure, Antiochus turned his whole attention to the destruction of Achæus, whom he overpowered and put to death: by this act the provinces of Asia Minor were again annexed to the Syrian empire, (B.C. 213.)

Having secured his western at the expense of his southern dominions, Antiochus turned his attention towards the east, where the growing power of Parthia threatened serious danger. Arsaces, the son of him who established the Parthian empire, had overrun Media while Antiochus was engaged in the wars against Ptolemy and Achæus. He was

unable to withstand the attack of Antiochus in person, and was soon driven out of his new conquest. The Syrian monarch in his turn invaded Parthia, and after several campaigns, a treaty was concluded, by which Arsaces was left in quiet possession of Hyrcania, on condition of his assisting Antiochus to recover the rest of the revolted provinces. After an unsuccessful attempt to recover Bactria from Euthydemus, with whom he at last concluded a treaty, he crossed the mountains of Paropamisus (also called Caucasus) into India, formed a treaty of alliance with the king of that portion of the country, and directing his march homeward through the provinces of Arachosia, Drangiana and Carmania, intermediate between the Indus and Persia, re-established the supremacy of Syria in those distant regions. He returned through Persia to Antioch, having been employed for seven years in these eastern campaigns. This was the most flourishing period of the Syrian empire since the revolt of Parthia in the reign of Antiochus Theos; and it was at this time that Antiochus had earned by his successes the most specious claim to the title of Great.

Soon after or about the time of the return of Antiochus, Ptolemy Epiphanes, a child of five years old, succeeded to the throne of Egypt, (B.C. 205,) on the death of his father, Ptolemy Philopator. Antiochus and Philip king of Macedonia united in a design to expel him, and share the Egyptian dominions between themselves. The unfortunate provinces of Palestine and Coele-syria were the bone of contention, the favourite battle-field on which their more powerful neighbours fought out their differences. Antiochus regained possession of them in the course of two campaigns. On his being called away to Asia Minor, Judæa was overrun by Scopas, the Egyptian general; but it was soon reconquered by Antiochus, who, upon entering Jerusalem, (B.C. 198,) was received by the Jewish people with great joy, and with every demonstration of respect; in return, he granted many privileges to them, especially ordaining that no foreigner should be permitted to demand access into the interior of the temple. But, finding the power of Egypt still unbroken, and his own resources incompetent to wage war on two sides of his empire at once, and being anxious to recover all that had belonged to the first Seleucus in Asia Minor, Antiochus now proposed a treaty of marriage between his daughter and the young king of Egypt, to be consummated when both came of age, by which Coele-syria and Palestine were to be given with the princess as a dowry. Having thus purchased the neutrality of his most powerful enemy, he proceeded with a powerful fleet round Asia Minor, reducing, in his way, many of the maritime Greek cities. He crossed the Hellespont, and took possession of the Thracian Chersonese, (B.C. 196,) which he claimed for his inheritance, as having been conquered by Seleucus Nicator from Lysimachus: and here he came in contact, for the first time, with the power before which his own was compelled to retire. The Romans had already reduced Macedonia to the condition of a subject kingdom, thus indicating the extent of their ambition, and the probable consequence of their success in the second Punic war, when Antiochus crossed into Europe, and wrested the Chersonese from the impaired power of Philip. Jealous of this new interferer in the affairs of Europe, the Romans sent ambassadors to require restitution, not only of all that Antiochus had taken from Philip, but of all that he had taken from Ptolemy, whose guardians, soon after his accession to the throne, had placed him under the wardship of the Romans, as a protection against the ambition of his Syrian neighbour. Antiochus replied to these requisitions in terms as haughty as those in which they were made; and it was evident that the quarrel would soon end in an appeal to arms. (See Polybius, xviii. 33.)

In the following year, (B.C. 195,) Hannibal, driven from Carthage, came to Ephesus to seek the protection of the king of Syria: and his representations, joined to the known value of his services, fixed the wavering determination of Antiochus, and induced him to match his strength against the redoubtable power of Rome. A period of negotiation elapsed, in which neither party would abate from their pretensions, and neither probably was sincerely desirous of peace. It was both the misfortune and the fault of Antiochus, that he suffered his confidence to be alienated from Hannibal, and allowed him no share in the direction of affairs. In the winter of 192 B.C., Antiochus was invited by the Ætolians to pass into Greece. He crossed over with an army, posted himself in the town of Demetrias, and was

chosen by the Ætolians as their commander-in-chief. Antiochus appears to have managed affairs badly. He might have made the king of Macedon his friend instead of his enemy; and after his capture of Eubœa, instead of pushing on his conquests, he spent his time at Chalcis, and in negotiating with the petty states around him. The Roman consul, Atilius Glabrio, with Cato for his legate, now advanced against the Syrian king, who made a stand at Thermopylæ, but was utterly routed and compelled to retire to Asia, (B.C. 191.) The next year L. Cornelius Scipio was elected consul, and appointed to conduct the Syrian war, and his brother, the celebrated Africanus, served under him in the quality of lieutenant. Under their able guidance the war was soon terminated; and its end was hastened by the unskilful conduct of Antiochus. Disheartened by his reverses, and especially by a second defeat at sea, he withdrew his forces from Lysimachia, in Thrace, and from the strong cities on the Hellespont, which would at least have retarded the progress of the Romans for some time; and thus he gave them free access into Asia. Yet they had no sooner crossed the Hellespont, than, struck with terror, he sent ambassadors to endeavour to negotiate a peace. The terms he offered, though tolerably humiliating, were not such as satisfied the ambition of the Romans, who required that he should defray all the expenses to which they had been put during the war, set at liberty all the Greek cities, and evacuate the whole of Asia Minor west of Mount Taurus. These conditions Antiochus, thinking that no harder could be imposed on a conquered enemy, refused to accept, and collecting his whole force, he met the consul Scipio, (B.C. 190.) in a pitched battle near Magnesia of Sipylus, in which he was defeated with immense slaughter. This was decisive: he retired hastily to Syria, and again sent to negotiate for peace, which he obtained on terms not materially harder than those before offered, yet such as must have been very galling to the haughty monarch, and hitherto successful conqueror. He was to resign the provinces west of Mount Taurus: to pay 15,000 Euboic talents for the expenses of the war; to deliver up to the Romans his elephants and ships of war: and, a yet more disgraceful stipulation, to place in their hands Hannibal, and other foreigners who had taken refuge at his court from the hatred of that grasping and revengeful people. Hannibal, with another, preserved his safety by timely flight: the rest were delivered up, together with hostages for the observance of the treaty, of whom Antiochus Epiphanes, the king's younger son, was one.

Antiochus did not long survive this humiliating treaty, which was, in some degree, the cause of his death. In collecting means to pay the heavy burden imposed upon him, he was led to plunder a wealthy temple in the province of Elymais. Indignant at the sacrilege, the people of the place rose in arms, and massacred him and his attendants, (B.C. 187.) in the thirty-seventh year of his reign, and fifty-second of his age. He merited the title of Great, only as being the most eminent of a series of princes of the same name, none of whom were distinguished either for talent or goodness. He did more, however, to restore the greatness of the Syrian kingdom under the first Seleucus, than any other of his dynasty; but he was unfortunate in meeting the first shock of that iron power before which all the great monarchies of the known world were destined to fall. (Polybius, lib. 5, &c.; Appian, *Syriaca*; Liv. lib. 36, 37; Raleigh, *Hist. of World: Anc. Univ. Hist.*, vol. viii.)

IV. ANTIOCHUS, surnamed Epiphanes, or Illustrious, the second son of Antiochus the Great, succeeded his elder brother Seleucus Philopator (B.C. 175 or 176). Antiochus was, at the time of his brother's death, on his way from Rome, where he had been detained as a hostage for the observance of the treaty concluded with his father after the battle of Magnesia.

The first events of his reign which require notice, are his hostilities with Egypt, which then reclaimed the provinces of Palestine and Coele Syria, wrested from her by Antiochus the Great. In the first campaign, (B.C. 171,) he routed the Egyptians between Mount Casius and Pelusium, and took advantage of his success to fortify the frontiers of Palestine against farther aggression. Pursuing his success, in the next year he overran all Egypt, except the strong city of Alexandria, and gained possession of the person of Ptolemy Philometor, the young king. In the same year he sacked Jerusalem, and profaned and plundered the temple, as related in Maccabees i. c. 1, and ii. c. 5: after which he appointed Philip the Phrygian governor of Judæa. After the capture of the reigning prince, the Alexandrians raised Ptolemy Euergetes, commonly called Physcon, his brother, to the throne. This induced Antiochus to undertake a third expedition to Egypt (B.C. 169); in which, under pretence of restoring the kingdom to Ptolemy Philometor, he renewed the war, defeated the Egyptians, and laid siege to Alexandria. Being unable to reduce that city, he left Philometor as the nominal king of the country, retaining in his own hands only the strong city of Pelusium, the key of Egypt on the side of Syria. He hoped that the quarrels of the rival brothers would exhaust the strength, and facilitate the entire reduction of that country; but here he was disappointed; for seeing through his ambitious designs, they agreed to hold the kingdom in common, and Egypt was restored for a time to its former tranquillity. Hereupon Antiochus undertook a fourth expedition (B.C. 168), entered and subdued Egypt, and was on the point of laying siege to Alexandria, when he was met by ambassadors from Rome, who peremptorily required him to depart from Egypt, and the imperious mandate was obeyed. Returning through Palestine in the same year, he vented his spleen by ordering that great persecution of the Jews related in the second book of Maccabees, in which the temple was polluted, and its service broken off, until, after the lapse of more than three years, it was restored by Judas Maccabæus. Of the Maccabean wars we shall give an account under the article MACCABEES: the cruelties perpetrated on the insurgent Jews in the course of them, by the agents, and under the command of Antiochus, have rendered his name deservedly hateful. The steady and successful resistance of that high-spirited people drained Syria of army after army: and the difficulties of the king were increased by revolts in Armenia and Persia. Dividing his disposable force into two parts, he sent one under the command of Lysias into Judæa: and led the other himself into the revolted provinces, which he soon brought back to their allegiance. While thus employed, he received tidings of the total defeat of his armies in Judæa. Transported with passion, he hastened towards Antioch, devoting the Jewish people to destruction, when, in the midst of his imprecations, he was seized with violent internal pains. Still he continued to pursue his journey with precipitation, until he fell from his chariot, and was so much injured as to be obliged to halt at a town called Tabæ, the situation of which is not certainly known. There he died, B.C. 165, in dreadful agony both of body and mind. He was a prince of dissolute and undignified character, as well as stained with the darker vice of cruelty. Given up to drunkenness, to low debauchery, and to gross buffoonery, he received from his subjects the nickname of Epimanes, or the Madman, in parody of his assumed title of Epiphanes, or Illustrious. (Livy, xlii., &c.; Polybius.)

V. ANTIOCHUS, surnamed Eupator, or well-fathered, son of A. Epiphanes, a child nine years old, succeeded to the throne, under the guardianship of Lysias, well known in the Jewish wars. After a nominal reign of nearly two years he was dethroned, and put to death by his cousin-german, Demetrius Soter, son of Seleucus Philopator, who succeeded to the crown, B.C. 162.

VI. ANTIOCHUS, was the son of Alexander Balas, who, being deposed by Demetrius Nicator, son of Demetrius Soter, and perishing in Arabia, left a son, A. Theos; who was raised up by Diodotus, surnamed Tryphon, as a stalking horse, by the help of which he might displace Nicator, and make his own way to empire. The young pretender was at this time but seven years old: but he was readily raised to the throne, for the excesses of the reigning prince had alienated his subjects. After a nominal reign of two years he was put to death by Tryphon, who assumed the crown. (B.C. 144-2.)

VII. ANTIOCHUS, surnamed Sidetes, or the Hunter,

(so named from a Syriac word, signifying to hunt, according to some authorities, but more probably from the town of Side,) was a younger son of Demetrius Soter, and brother of Demetrius Nicator. The latter, when expelled by A. VI. and Tryphon, experienced various fortunes, and fell at last into the hands of the Parthians. A. Sidetes then married his brother's wife, Cleopatra, laid claim to Syria, and expelled Tryphon, (B.C. 138,) who had held it since the murder of A. VI. His reign was prosperous and tranquil, compared with the weak and turbulent governments of his immediate predecessors. He reduced many cities, which had taken advantage of the civil wars to assume independence, and among them Jerusalem (B.C. 131): and he engaged in war with Parthia, which had profited by the distractions of Syria to usurp much of her eastern dominions. He defeated Phraates, king of Parthia, in three battles, compelled him to retire within the limits of Parthia itself, and recovered all which had been wrested from Syria, except that province; but his life and reign were brought to an untimely close in a sudden onset made by the enemy upon his winter quarters. He perished, B.C. 129 or 128, leaving a fairer character for justice, generosity, and bravery, than belongs to most of the princes of this most profligate age.

VIII. ANTIOCHUS, surnamed Grypus, or Hook-nosed, from γρύψ, a vulture. After the death of A. Sidetes, Syria was again distracted by civil wars. Demetrius Nicator escaped from Parthia, and resumed the crown; but he was soon dethroned by Alexander Zabinas. Cleopatra, the wife successively of Balas, D. Nicator, and A. Sidetes, retained possession, however, of a portion of Syria; and Seleucus, her son by D. Nicator, regained some districts contiguous to those held by his mother, and proclaimed himself King of Syria. This raised her jealousy, and she murdered him with her own hand. Still thinking it necessary to have some one of royal blood to give countenance to the sovereign power which she was bent on acquiring for herself, she recalled from Athens, her son Antiochus Grypus, (named also Philometor, and, on his medals, Epiphanes,) B.C. 125. Supported by Egypt, Grypus soon expelled Alexander Zabinas. Cleopatra then became jealous of him also; and perished, being compelled to drink a poisoned draught, which she herself had offered to her son. Grypus then reigned in peace for eight years; at the end of which a fresh competitor for the throne started up in the person of his half-brother.

IX. ANTIOCHUS, surnamed Cyzicenus, from being educated at Cyzicus, the son of Cleopatra by A. Sidetes. After a sharp contest the brothers agreed to divide the empire, B.C. 113 or 112: A. Cyzicenus occupied Cœlesyria and Palestine; A. Grypus, the rest of the empire. Both led a dissolute and careless life, and several great cities, as Tyre, Sidon, &c., profited by their supineness to assume a short-lived independence. Grypus was assassinated, B.C. 96. A. Cyzicenus was defeated and slain by Seleucus, the son and successor of A. Grypus, B.C. 95. Seleucus perished, after a short reign, if a period of contest may be called such, of seven months.

X. ANTIOCHUS, surnamed Eusebes the Pious, son of A. Cyzicenus, proclaimed himself King of Syria upon his father's death. For a time he disputed the throne with his cousins, Philip and Demetrius Eukæros, sons of A. Grypus; but (B.C. 88) he was compelled to fly into Parthia. He returned (B.C. 86), Eukæros being dead or banished; and while he was engaged in war with Philip, another Antiochus, surnamed Dionysius, full brother to Philip, seized upon Cœlesyria. The latter was soon slain in a war against the Arabians. After a brief period, the Syrians, wearied by the desolating feuds of the Seleucidan princes, invited Tigranes, king of Armenia, to take possession of the country. Eusebes then fled into Cilicia, (B.C. 83,) and passed the remainder of his life in obscurity. The events of this reign are very confused.

XI. ANTIOCHUS, surnamed Asiaticus, was the son of A. Eusebes. Tigranes being obliged to withdraw his troops from Syria to make head against the Romans, A. Asiaticus gained possession of part of the kingdom, B.C. 69. He retained it for four years, at the end of which Syria was reduced by Pompey to the condition of a Roman province, B.C. 65. In Antiochus Asiaticus, the Seleucidan dynasty ended, having ruled Syria for 247 years, reckoning from the time when Seleucus Nicator began his reign in B.C. 312. (For the chronology of the Syrian kings the reader should consult *Justin's Fasti Hellenici*.)

ANTIOCHUS OF COMMAGENE. [See COMMAGENE.]

ANTIPAROS, called also by the ancients Olearos, one of the group of the Cyclades, is situated between Siphnos and Paros, and separated from the latter by a dangerous channel one mile and a half wide. It is seven miles long, north and south, and three miles broad, and contains one small village, with about 300 inhabitants; its productions are trifling, consisting only of a small quantity of poor wine, and a little cotton and barley. The island is a mass of white marble, and is only celebrated for its grotto: the entrance to it, which is on the side of a rock, is by a low arch formed of rough craggy rocks, about thirty paces wide, and divided into two by several natural pillars. This passage continues at twenty yards, at the end of which is a precipice that must be descended by the aid of ropes, fastened to the masses of stalactites; after advancing a little farther under a ridge of rugged rocks, there is another descent, but not so precipitous as the last. Another passage about nine feet high and seven wide, whose walls and arched roof, composed of glittering white and red marble, are as smooth as if wrought by art, leads to a third precipice, the sides of which appear like a sheet of amethysts. Then follows a sloping passage of about 200 yards, on each side of which the petrifications assume the appearance of a ragged curtain partially drawn, and occasionally of snakes coiled up in folds; this conducts to the fourth and last descent. At the bottom of this is the grotto 120 yards long, 113 wide, and 60 feet high; it is an immense arch of white marble, from the roof of which depend large stalactites ten feet long, and as thick as a man's waist, with a thousand festoons and leaves of the same substance; the floor is rough and uneven, with various coloured crystals and stalagmites rising up; and in the midst is one, twenty feet in diameter, and twenty-four feet high. It was this pyramid of stalagmite that served as an altar when M. de Nointel visited the grotto, and celebrated mass on it. When lighted up, the whole presents a most brilliant and magnificent scene, but the smoke from the torches of the numerous visitors has somewhat dimmed its effulgence. In some places the stalactites have partitioned off portions of the cavern into cells. The difficulty of reaching the grotto has latterly been much diminished by the provision of rope-ladders, torches, &c., for which the guides make a small demand on the purse of the traveller. It is not certain that the extremity of the grotto has ever been explored. The highest point of the island is in 37° N. lat., and 25° 3' E. long. (See also Tournesfort's *Voyage au Levant: Encyclopédie Method. Géog. Physique*.)

ANTIPATER, a Macedonian of high birth and high reputation, the chosen and trusted officer of Philip and of Alexander the Great. He was the pupil and friend of Aristotle; he was learned himself, and the patron of learned men. When Alexander left Europe for Asia, he entrusted the government of Macedonia and the regulation of Greece to Antipater. During the year B.C. 331, an attempt was made by Lacedæmon, Achaia, Eleia, and the greater part of Arcadia, to deliver Peloponnesus from the supremacy of Macedonia. Antipater, marching into Peloponnesus to quell the disturbance, was met by Agis, king of Lacedæmon: and a battle ensued in which the latter was slain, and his army defeated and broken. The victor summoned a congress to meet at Corinth, at which a fine of 120 talents was imposed upon the Eleians and Achæians: the Lacedæmonians were obliged to submit at discretion, referring their punishment to the arbitration of Alexander. It does not appear that any severe measures were taken against them.

Well acquainted with the dangerous temper of his mother Olympias, Alexander had abstained from allowing her any share in the administration of Macedonia during his own absence. She did not bear this exclusion patiently, and succeeded in raising jealousies between her son and Antipater, inasmuch that Alexander determined to remove his viceroy to a less independent situation. Shortly before his death he sent home Craterus, a distinguished officer, in command of a large body of Macedonian veterans who had earned their discharge; and commissioned him to assume the government of Macedonia, while Antipater was ordered to conduct fresh levies to Babylon. A report was current, but it is not corroborated by the best authorities, that Antipater, fearful of a like fate to that which had overtaken Parmenion, and others of his master's followers, administered poison to Alexander, by means of his sons Cassander and Iolas, who held the office of cup-bearers.

We do not give credit to this story: but it is certain that Alexander did die at a critical time for the fortunes of Antipater, before Craterus had reached Greece. The late king's brother Arrhidæus, a bastard son of Philip, was raised to the throne by the Macedonian generals, and the army in Asia; and Perdicas was appointed viceroy over the king, who was a young man of weak intellect, with the same sort of power as the *Maires du Palais* exercised in old times in France towards the end of the Merovingian dynasty.

In the distribution of provinces among the chief officers of Alexander, to be held nominally in subordination to the Macedonian crown, though in fact, and speedily in name, converted into separate and independent kingdoms, Antipater was confirmed in the possession of Macedonia, and the adjacent countries. He was soon provided with employment. The Athenians, impatient of the superiority of a nation whom they hardly acknowledged to be of pure Hellenic blood, had already made some preparation for war with Macedonia before the death of Alexander was fully known. A vote was passed, that the state would take charge of the common freedom of Greece, and liberate the cities held in check by Macedonian garrisons: a powerful armament was put in preparation, both by land and sea; and ambassadors were sent to invite all the people of Greece to join in the undertaking. Athens was soon at the head of a powerful confederacy, comprising the Ætolians, Thessalians, and almost all the Greeks north of the Isthmus, except the Boeotians; and of Peloponnesus, the Argives, Eleians, Messenians, and Sicyonians. Leosthenes, the Athenian general, posted the allied army at Thermopylae, the celebrated pass commanding the entrance into Greece from the north. Antipater, drained of troops by Alexander's frequent demand of reinforcements, was unable to collect more than 13,000 foot and 600 horse, with which he advanced against Leosthenes. A battle ensued, in which the Macedonians were defeated, somewhere between Pylo and the town of Lamia in Thessaly, to which Antipater retreated, meaning to abide a siege until assistance, for which he had already sent, should arrive from Asia.

Leonnatus, one of Alexander's generals who had obtained the satrapy of Mysia, otherwise called Hellespontine Phrygia, was the first who came to help Antipater. The Hellenes (as Diodorus distinguishes them) broke up the siege and marched to meet Leonnatus: a battle ensued, in which the Macedonians were beaten and their general killed. Meanwhile Antipater evacuated Lamia, and formed a junction with the defeated army; by the help of which he kept the field, though he dared not venture on another battle. But Craterus arrived from Asia with 12,500 veteran troops, which he placed under the command of Antipater; who, thus reinforced, found himself at the head of 48,000 men, while the Athenians, weakened by the return home of a considerable part of their ill-cemented army, could only muster 28,000 men. An indecisive battle ensued, in which the excellence of their Thessalian horse, which had won the first battle, now saved them from complete defeat; but they felt their inferiority too much to risk another encounter, and sent to treat of peace with Antipater. This, called the battle of Cranon, occurred in August, B.C. 322. Antipater refused to treat with the confederates collectively, but expressed his willingness to come to terms with them severally. This policy was justified by the event, for though the Greeks refused at first to dissolve the alliance, yet the several members of it dropped off by degrees, and left the Athenians and Ætolians, the most obstinate enemies of Macedonia, to secure their safety as they could. Antipater marched with his whole force against Athens: and the citizens, utterly unable to resist, sent Phocion and Demades to sue for peace. They obtained it upon easier terms than were always allowed in Grecian warfare; for he only required two obnoxious persons, the orators Demosthenes and Hyperides, to be delivered up, and granted full security both to person and property, on condition that a Macedonian garrison should be henceforth quartered in Munychia, to guard against a counter-revolution, and that a complete change should be made in the form of government, the democracy being abolished, and all political power vested in a body of about 9000 citizens, who were possessed of property up to a certain amount. He removed a large number of the poorer class (apparently with their own consent) into Thrace, where lands were assigned them. Thus ended the Lamian war, as it is called.

in the autumn of B.C. 322, the year after its commencement. Antipater returned to Macedonia.

The Ætolians were the only members of the confederacy who still held out. In the same autumn, Antipater and Craterus marched against them. They abandoned their indefensible towns; deposited their women and children in their rugged mountains; and collecting their able-bodied men, prepared to hold out in their fortresses, and in those cities which were capable of being maintained. In the first encounters the Macedonians sustained considerable loss; but the superiority of force by degrees prevailed; and the Ætolians, shut up in the mountains, and exposed to the severity of a mountain winter, almost without shelter or food, except that which they won at the sword's point, were almost reduced to despair, when they were relieved by unexpected news from Asia.

For the proceedings in Asia after Alexander's death, we must refer to PERDICEAS: it is enough here to state that the ambition of that general led him to aspire to be Alexander's successor in the throne of half the known world. One of his first steps was to rid himself of Antigonus, whose sententious and activity he feared; but the latter, fathoming his designs, fled hastily to Antipater, and apprised him of the danger to which he, in common with others, was exposed. To check Perdicas in time was more important than to punish the Ætolians; and consequently, after concluding a hasty peace with the brave mountaineers, Antipater and Craterus led their army into Asia. They separated: Craterus took the field against Eumenes, satrap of Cappadocia and Paphlagonia, by whom he was defeated and slain; while Antipater marched into Cilicia to meet Perdicas. But he found no enemy, Perdicas having been slain in Egypt; and the Macedonian troops, after a short interval, elected Antipater to the office of regent, or protector. These transactions seem to have taken place in the year 321, but there is some confusion as to the chronology. [See ANTIPOXUS.] In this new capacity he made a fresh distribution of the provinces: after which he returned to Macedonia, taking with him the king and queen, Arrhidæus and Eurydice, and leaving Antigonus to conduct the war against Eumenes. This seems to have been in 320.

Antipater held the regency undisturbed till his death, which took place in 318. We hear no more particulars of him, except that he fell into a dangerous illness, and that one of his last actions was to put to death the orator Demades and his son, who had been sent ambassadors by the Athenians to request that the Macedonian troops might be removed from Munychia. Demades had always been on good terms with Antipater, till the Macedonian found, among the papers of Perdicas, letters written by the orator, exhorting Perdicas to carry the war into Europe. The regent had not forgotten this: he returned no answer to the address of Demades, but merely made a signal to his ministers of punishment (*τὴν τιμωρίαν ἐπὶ ταῖς τιμωρίαις*), who put the ambassadors to death without further ceremony.

Dying soon after, Antipater left the regency to Polysperchon, one of the oldest of Alexander's surviving generals. He appointed his son Cassander to be chiliarch, a term originally meaning captain of a thousand men, but transferred by the Persians to some high officer at court, and adopted in that sense by Alexander, with many other of the Persian customs. Cassander, however, contested the possession of Macedonia with Polysperchon, and finally became master of that kingdom. The last advice which Antipater gave to his successors was, 'never to let a woman interfere in affairs of state.' This was expressly directed against Olympias, and her subsequent conduct fully proved the wisdom of it. Antipater died in his eighty-first year, having enjoyed a high reputation for his talents as a minister, and leaving a character less stained by cruelties and excesses than most of the contenders for empire who sprang up after the death of Alexander. (Diodorus, book xviii., &c.)

ANTIPATER, son of Antipas, the governor of Idumæa, was himself a native and governor of that province during the high-priesthood of Alexander Jannæus. After that prince's death, his sons, Hyrcanus and Aristobulus, disputed the succession. Antipater was a zealous partizan of the former, who, after a bloody contest, was established in the high-priesthood by Pompey the Great. This favourable issue was very mainly owing to the prudent management of the Idumæan, and he was rewarded by the confidence of his weak master under whose name he ruled in Judæa.

When Cæsar, during the celebrated siege of Alexandria, was himself besieged in his camp by the inhabitants of that city, Antipater came to his help, and found opportunity to perform good service, and signalize his own courage. Cæsar, in return, obtained for him the citizenship of Rome, and appointed him to the administration of Judea, which enjoyed tranquillity and prospered under his care. He was poisoned by a Jew named Machus, *v.c.* 49, through jealousy of his influence with Hyrcanus. The guilt of the crime was heightened by the ingratitude of the murderer, who had been indebted for his life to the man whom he poisoned, and had received other benefits at his hands. Antipater left four sons, of whom two are known in history: Phasaël, governor of Jerusalem, and the infamous Herod, king of the Jews.

These are the two most remarkable persons bearing the name of Antipater; but it is one of common occurrence in ancient history. Moreri has articles upon eighteen.

ANTIPATER, L. COELIUS, a Roman historian of the Second Punic War. [See **COELIUS**.]

ANTI-PATHY, (from the Greek *ἀντιπάθεια*, compounded of *ἀντι* *contrary*, and *πάθος* *feeling*;) properly signifies an involuntary dislike or aversion entertained by an animate being for some sensible object. Thus a man may have an antipathy to particular smells or tastes—a turkey-cock to the colour red, or a horse to the smell of raw meat, &c. There is no doubt that many antipathies are natural, and do not arise from any accidental circumstance: such as the aversion in mankind to the tastes and smells of many drugs, and of bodies in a state of putrefaction. Such natural antipathies may, however, in many cases, be overcome by habit: as in the case of surgeons, who soon learn to conquer the disgust occasioned by the effluvia arising in the dissection of the human subject. Some nations constantly eat food which the rest of mankind would nauseate, as the Esquimaux, who live on whale blubber and train oil. When the Cossacks were in London and Paris, in 1814, they sometimes drank the whale oil from the lamps in the streets: probably an Englishman or Frenchman would, if starving, reject the draught which the Cossack considered as a luxury. It is moreover quite conceivable that individuals may have such physical peculiarities as will cause them to feel pain from impressions on the senses which, to the generality of mankind, are indifferent, or even pleasurable: thus some persons are painfully affected by the smells of certain flowers or perfumes, which are commonly considered agreeable, and are old as means of sensual enjoyment. Many antipathies, however, are not natural, but acquired, and arise from our associating certain objects with the idea of something terrible or dangerous. Thus people acquire antipathies to spiders, earwigs, wasps, snakes, rats, and other animals, from forming exaggerated notions of their powers of harming mankind: and by encouraging such aversions, they may acquire so great sensitiveness and acuteness in distinguishing these animals by the smell, sight, or hearing, that they may be aware of their presence when other people are unconscious of it. Persons may acquire antipathies to certain kinds of food by having been surfeited with them, or by having been accustomed to eat them for long periods of time, as under a medical regimen during an illness: or because they are made of substances which they consider as unclean, or because they are unfashionable, as being eaten by people whom they think less refined and delicate than themselves. This may not unfrequently be observed in persons of narrow and feeble minds, and more especially in children, in whom such fanciful dislikes ought to be carefully but not harshly corrected. (See Locke's *Essay on the Understanding*, b. ii. c. 33, § 7 and 8.)

Antipathy properly means, as we defined it, a dislike of an animate being for some *sensible* object. Its meaning, however, is sometimes improperly extended to *inanimate* beings—a phraseology now nearly obsolete, but which was much used by the ancient naturalists, who would, for example, have said that an alkali had an antipathy to an acid, or that water had an antipathy to oil. At other times the word is restricted to animate beings, but is applied to things which are not objects of the senses. Thus it has been said that the mind has an antipathy to certain classes of actions; by which it is meant that it is endued with an innate faculty of distinguishing between right and wrong. [See **MORAL SENSE**.]

It is sometimes stated that *antipathy* is the contrary of *sympathy* but this is not strictly true, at least as respects

the use of those two words in modern language. **Sympathy** means *joint sensibility*, or the feeling of pain or pleasure in consequence of pain or pleasure felt by another sentient being. Thus a person who pitied the misfortunes of another, or who felt delight in the same pursuits, amusements, or studies, as another, would in either case be said to sympathize with him. Sometimes sympathy is applied to the simultaneous irritability of different parts of the body: thus one eye is said to sympathize with the other, when an injury inflicted on one is felt by both. [See **SYMPATHY**.]

ANTI-PAXO. [See **PAXO**.]

ANTIPHLOGISTIC TREATMENT, (from two Greek words, *ἀντι* *against*, and *φλόγωσις* *inflammation*;) is the means of removing, or lessening, inflammation, and of obviating its effects. As it would be out of place here to consider fully either inflammation, or its causes, we shall merely state that these last are, either mechanical, as wounds, bruises, &c., or of a more general nature, as atmospheric changes operating on the body from without, or altered conditions of some of the organs or functions of the body, operating within, and influencing, more or less, the rest of the system. The effects of the first set of causes are, primarily, always local, but sooner or later become general, i.e., affect the whole system; the effects of the second set of causes may be, primarily, either local or general: but when local, having a much greater tendency early to become general. The local effects seem to consist in an alteration of the vital action of the part, accompanied with *pain*, *swelling*, and increased *heat* and *redness*. The general effects are disturbance of various functions, most usually a diminution of the functions of respiration, exhalation, and nutrition, or assimilation: the heart's action, the respiration, and functions of the nervous system are also affected, but in different degree and order in different cases. The change of the vital action of the part appears to produce a quickened movement of blood in the extreme vessels, or capillaries, as they are termed, which are sometimes slightly contracted, though more commonly dilated, so that the blood presently begins to move more slowly, and at length stagnates in the part, as we may see in the white of the eye when inflamed. The blood, too, in the neighbouring capillaries, seems to incline towards the part, while the large arteries leading to it, and ultimately the heart, assume an increased action, which occasions greater frequency and, generally, force of pulse. The consequences of these alterations of the action of the vessels are, the effusion either of some of the constituents of the blood, as the serum or albumen, in their natural state, or their change into substances not found in blood, or any other fluid of the body, in its healthy state. These become the source of further change of structure, as suppuration, ulceration, &c., and the cause of disturbance in the functions of the system, varying with the seat of the inflammation, its intensity, and other circumstances.

The means of preventing or moderating these constitute collectively the antiphlogistic treatment and regimen. We shall here briefly notice the chief of these.

Blood-letting.—We have just stated that one of the effects of inflammation is to produce effusion of the serum or lymph of the blood, the extent of which depends on the quantity of blood which goes to the parts affected. The processes of inflammation, in its earlier stages, may be very certainly restrained or arrested by diminishing that quantity. This is done by abstraction of blood, either local or general. If the inflammation be allowed to proceed, suppuration, ulceration, or other changes, and destruction of parts, according to the texture affected, will ensue. Now abstraction of blood, though it may prevent the extension of suppuration and ulceration to parts not yet affected, is rarely found effectual in checking the formation of pus or matter, where that has been already established. We see then the necessity of the early employment of bleeding, and the other antiphlogistic means, if we desire them to be productive of the greatest amount of benefit. The prejudices and prevailing habits of the people are, however, generally in direct opposition to such beneficial measures; and too often timid practitioners allow their judgment to be overborne by the importunate requests for delay of the well-intending but ignorant relations. Thus the time when these measures would have proved most serviceable is allowed to pass over; and when at last put into practice, their good effects not being so conspicuous, they are not so highly appreciated as they would be, if employed at an earlier period. Indeed, at a very late stage, far from being useful, they are decidedly

hurtful. (See the case of a physician mentioned under the article **ABSTINENCE**.)

During inflammation of shut sacs, or cavities, *i.e.*, those cavities of the body which do not communicate with the external air, and which are lined with *serous* membranes, the disposition to effusion of much lymph, or the albumen of the blood, is greater than in other cases. To prevent this, more prompt and vigorous measures must be used. Modern physicians have ascertained that mercury, especially in combination with opium, has a powerful influence, not only in preventing the effusion of lymph, but in removing it soon after it is effused: an example of this is witnessed when, in the inflammation of the eye, called *iritis*, the pupil is filled up, and vision prevented by the lymph effused; yet this is speedily removed if a sufficient quantity of mercury be early introduced into the system. This, then, constitutes another valuable antiphlogistic means.

Purgatives.—The quantity of blood in the system, and the amount of serum, may be greatly lessened by the use of purgative medicines, especially the saline purgatives, which generally produce very liquid motions, consisting of a large proportion of serum. These are not only proper, but constitute an essential part of the antiphlogistic treatment.

Nauseants, &c. such doses of emetic medicines as occasion a constant feeling of sickness, without causing vomiting, reduce the action of the heart, and lessen the tendency to effusion, while they promote the absorption of the fluid already effused. They are, consequently, very valuable auxiliary agents in subduing inflammatory diseases.

Diaphoretics. The quantity of blood may be diminished, and its acrimony lessened, by increasing the perspiration, or discharge from the skin, which in most cases of inflammation is lessened, and in some altogether suppressed. By this diminution or suppression of perspiration not only more blood is retained in the system, but also those salts and acids which in a healthy state find an outlet by this channel. The means of increasing perspiration are termed diaphoretics, or sudorifics. These, however, seldom produce the desired effect, if there be much heat of surface, *i.e.* of the skin. This must previously be moderated by the use of the means already stated, *viz.*, bleeding and purgatives, and also by the use of

Refrigerants.—These consist of cooling drinks to be taken internally, and cold applications, as cloths dipped in ice water, or vinegar and water, or even ice itself, or evaporating lotions laid upon the part affected. The cold *effusion* is often very serviceable in reducing the temperature and procuring sleep, during which a flow of perspiration, which frequently proves critical, is apt to occur.

It is self-evident that no good can follow the use of any or all of these means of lessening the quantity of blood in the body, if we continue to supply the means of forming it as fast as we remove it. The *died* of the patient is, therefore, *a*, we might almost say *the*, most important point in the treatment.

During inflammation, as stated above, the functions of secretion and exhalation, as well as of nutrition, are lessened or entirely suspended; there is, therefore, no means of consuming or disposing of the nutritious matter already contained in the blood. How inconsiderate then, and how absurd it is, if life be valued at all, to use means which greatly increase this? Persons do not die of inanition, or from the effects of the absolute privation of food, under many days or weeks, (see the two cases narrated under **ABSTINENCE**.) while thousands, millions, die of inflammatory diseases, in a period varying from a few days down to a few hours. At the beginning of all severe inflammations, there is a failure of the appetite; this intimation on the part of nature, ever watchful for the preservation of her works, cannot be slighted with impunity. Reason and experience strictly enjoin an immediate attention to the diet. Its quantity should be lessened, and in most cases its quality changed. In respect to the reduction of quantity no limit need be placed at the commencement, as it can never be reduced too low; but during convalescence careful regulation of it is necessary, that it may not be insufficient on the one hand, or excessive on the other. Still there is much less likelihood of erring on the side of deficiency, than of excess. The vessels of the part being much weakened, are again easily distended, and the inflammatory process renewed; hence the frequency of relapses. Dr. Baillie has recorded it as the result of his experience, 'that he never observed a person having a relapse of fever where it had

not been caused by eating animal food.' It may be well to explain here in what way animal food proves hurtful. During its use the blood requires more frequent purifying by exposure to the air in the lungs, or by respiration. To effect this, not only is more frequent respiration necessary, but also the heart's action is increased, so that the blood is propelled with greater frequency and force, and consequently the distention of the vessels of the inflamed part is increased. The greater frequency of the respiration, occasioned by the greater demand for oxygen, during the use of animal food, is illustrated by the experience of the workmen in diving-bells, who require the air to be renewed much more frequently when living upon animal food and drinking spirituous liquors, than when living on vegetable food and drinking water. For this reason, the pearl-divers of Ceylon, who live exclusively on rice and other vegetables, can remain much longer under water, without requiring to come to the surface to breathe, than any Europeans who live on a mixture of animal and vegetable food. Animal food and spirituous or fermented drinks must be strictly interdicted at the commencement of inflammation, and their use be avoided till the permission of the medical attendant be deliberately and voluntarily given; previous to which mild, farinaceous food, and diluent drinks, should constitute the only diet.

Rest.—A person in a horizontal position respire less frequently than when in an upright position; the heart also pulsates less frequently. In every case of inflammation affecting the system generally, the patient should be confined to bed; and as there is mostly diminished power of the muscular system, all unnecessary exertion should be avoided. Numerous visitors should not have access to the sick-room: for speaking, which requires the exercise of the respiratory organs, fatigues the patient, and quickens the circulation. Besides this, the air is vitiated by the respiration of visitors. A supply of pure and cool air is requisite in all inflammatory complaints, but especially fevers, both for the benefit of the patient and the safety of others.

The repose of the mind is as essential as that of the body. All causes of anxiety should, when possible, be removed, and cheerful looks be put on before the patient, both by the physician and the attendants, in order that, as far as practicable, he may be inspired with confidence and entertain hopes of recovery.

This is a very brief outline of the means termed antiphlogistic, by which we attempt to restore both the part affected and the system generally, to the natural and healthy state, when labouring under an inflammatory attack. The special application will be given as each disease falls under notice, and we need not here do more than endeavour to impress upon every one a conviction of their importance. Under favourable circumstances inflammation is more completely under the control of remedies than any other disease; and nevertheless, it is more or less concerned in producing a very large share of the mortality in every part of the world. (See Alison's *Outlines of Pathology*.)

ANTIPHON, the son of Sophilus, and the oldest of the Athenian orators, who are generally known under the denomination of the 'ten,' belonged to Rhamnus, a *demus* or township of Attica, and was born about *B.C.* 480, the year of the great victory over the Persians. He was a contemporary of the famous Gorgias who visited Athens, and somewhat younger than this sophist, but there is no distinct proof that he was his pupil, though it is sometimes asserted; nor are we told who was his master. In course of time he opened a school of rhetoric, and numbered among his pupils Thucydides, the historian of the Peloponnesian war, who, in a passage of his eighth book (chap. lxxvi.), has commemorated the talents of his master, and recorded almost the only completely trustworthy event in his life. The opinion that Thucydides was the master of Antiphon appears to us untenable. (See Van Span.) It was the profession of Antiphon to write speeches for persons who had either to defend themselves in courts of justice, or wished to proceed against others, and also for those who had to address the public assemblies. According to tradition, he was the first who became a hired advocate of this description, though he merely wrote speeches, and never delivered any except on one occasion, when he was himself concerned. According to several authorities, he is the oldest writer who composed speeches for the courts of justice; no speeches of this character of higher antiquity being preserved. (Diodorus, Photius, &c.) There is no distinct proof, that is satisfactory, of his being early engaged in public service;

the silence of Thucydides, as to all his life previous to the events related in his eighth book, proves that he was not engaged in any important military capacity, at least during the Peloponnesian war. It has been conjectured that he is the archon Eponymus, or chief archon of Athens (Ol. xc. 3. or B.C. 418) mentioned by Diodorus (xii.) In the year B.C. 411, and in the latter part of the Peloponnesian war, a revolution was effected by which the Council of Five Hundred was abolished, and all political power was vested in a body of four hundred. [See ALCIBIADES, i. p. 279: PELOPONNESIAN WAR]. Antiphon, who never had come forward as a public man, did not show himself on this occasion, though he was the real author of the revolution, and Pisanor, who appeared as spokesman, was merely his agent. Shortly after this change, Antiphon and Phrynichus with ten others were sent to Lacedæmon to make peace on any terms that were tolerable. The ambassadors returned without effecting their object. Discontent grew stronger; Phrynichus was assassinated in the public place, a counter-revolution was immediately effected, and Alcibiades was recalled from exile. Immediately after the event, Antiphon, now seventy years of age, was tried for his life on a charge of treason to the state; he made, according to Thucydides, an admirable defence. His sentence (see the decree quoted by *Cæcilius in the Life of Antiphon*, attributed to Plutarch) was death; his property was confiscated, his house was pulled down, and the site was marked by stones bearing the inscription, Antiphon the Traitor. Antiphon, says Thucydides, was inferior to no Athenian of his time in virtue; he had also the greatest talents for conceiving any plan, and equal talent in expressing his conceptions. It is singular that Thucydides says nothing about the sentence or the death of Antiphon.

There were at least five or six other persons in antiquity who bore the name of Antiphon. Several of these different persons have been confounded in the rambling life of Antiphon attributed to Plutarch. One of them was a sophist, and appears to have been the author of a work on *Truth*, in which it is conjectured, from a few references to it in extant writers, that some of the leading doctrines afterwards promulgated by Epicurus were announced by Antiphon. The orator, according to some accounts of very little credit, was executed under the tyranny of the Thirty after the close of the Peloponnesian war. (See Xenophon, *Hellenic*, ii. 3, 40; and Van Spaan, *Dissertation de Antiph. Orat.*)

Antiphon wrote a treatise on *Rhetoric*, which is lost. Sixty orations were once extant under the name of Antiphon, but Cæcilius considered twenty-five of them to be spurious. At present there are fifteen extant, three of which are on subjects which were matters of judicial investigation, and are well worth reading. The other twelve are distributed into *tetralogies*, or fours, each set of four being on the same subject; they are merely rhetorical exercises, such as those to which Cicero alludes when speaking of Antiphon. (*Brutus*, chap. xii. 6.) The language of this writer is often obscure, and the style does not appear to us to merit the praise bestowed on it by some of the Greek critics. The orations of Antiphon are in the seventh volume of Reiske's collection, and in the first of Bekker's edition of the *Orators*. They are also in Dobson's collection, vol. i., with Van Spaan's *Dissertation*, &c. The text of Bekker is the best.

ANTI-PHONY, ANTI-PHONARIUM, in music, the book wherein the *antiphonies* were written. (See **ANTI-PHONY**.) By an order of Archbishop Winchelsea, made in 1305, every church in the province of Canterbury was obliged to be furnished with an *antiphony*, among other equally expensive books; and Spelman states, that in 1421 two *antiphonaries* cost the little monastery of Crabbhuse, in Norfolk, twenty-six marks, which he says was equal to 52*l.* according to the value of money in his time. We may, therefore, calculate the expense of a single one at not less than from 90*l.* to 100*l.* of our present money.

ANTI-PHONY, in music, (*antiphonia*, alternate singing,) the ancient name for a kind of anthem, the verses of which were chanted by each side of the choir, alternately.

The fathers of the church pretend that the method of antiphonal singing was revealed to St. Ignatius in a vision, who taught it to the Greeks. St. Ambrose introduced it in the western churches about the year 374. The chanting of the psalms in our cathedrals is a close imitation of the ancient antiphony.

ANTI-PODES, a term from the Greek, meaning

literally those who stand feet to feet, as is the case with the inhabitants of two opposite points of the globe. Previous to the establishment of the rotundity of the earth, and during the centuries of discussion which took place upon this point, the existence of antipodes was the theme of constant ridicule in the mouths of the opposers of the globular figure. The sentiments of Lactantius, *De Falsa Sapientia*, cap. 23, may be taken as a fair specimen of the common objections. He asks, 'Is there any one foolish enough to think, that there are men whose feet are higher than their heads? with whom those things that we place upon the earth hang downwards from the earth? who have trees and vegetables turned upside down, and rain and snow falling the wrong way? Will any one henceforward place the hanging gardens among the seven wonders of the world, when the philosophers make hanging seas, and fields, and cities, and mountains?' The confusion that here takes place between the words upwards and downwards will be now universally apparent, but was not so in the time of Lactantius, who lived A.D. 311; who, had he simply confined himself to the assertion, that the existence of antipodes could not be demonstrated, and treated it as a philosophical speculation, possibly true, but probably false, would have been justified by the general state of knowledge then existing. But not so when he asserts that he can prove the thing to be impossible, and professes that he sees no alternative, but supposing its defenders to be either joking, or intentionally lying. The French *Encyclopædia* is incorrect in stating that he appeals to the sacred writers as deciding the point.

Two antipodal points of the earth have the same number of degrees of latitude, one north and the other south, unless one of the points be on the equator, in which case the antipodal point is the opposite point of the equator. Their longitude differs by 180° or 12 hours, if we reckon longitude all round the globe: but if we use east and west longitude, the two longitudes must together make up 180° or 12 hours, one east and the other west. For example, the antipodes of a point in 22° north latitude and 60° east longitude, are in 22° south latitude, and 120° west longitude. We here insert, in opposite columns, the names of a few places which are nearly antipodal.

London	{ Antipodes Island, S.E. of New Zealand.
Nertchinsk	{ Falkland Islands.
Nankin	{ Buenos Ayres.
Mouths of the Amazon	{ Moluccas.
Bermudas	{ Swan River.
Quito	{ Middle of Sumatra.
Lima	{ Siam.
Timbuctoo	{ Friendly Islands.
Azores	{ Botany Bay.
Spain	{ New Zealand.

Antipodal places have the same climate, so far as that depends merely on latitude, but have all the seasons, days and nights completely reversed. Thus, noon of the longest day at the Bermudas is midnight of the shortest day at the Swan River. The remark as to the seasons of course does not apply to antipodal places on the equator.

When it is noon at any one place, it is midnight at the antipodes, and sunrise and sunset are reversed in the same manner. But we may ask, when it is noon on Friday at London, is it Friday night or Thursday night at Antipodes Island? There is no rule to determine this; we might call it either one or the other with perfect consistency. If two travellers were to set out from London for Antipodes Island, one of whom should go eastward through Europe and Asia, and the other westward through America, whatever time they might respectively take for the voyage, they would not agree in naming the day of their meeting. If they meet at the moment when Saturday morning begins at London, that is, at midnight between Friday and Saturday, in which case it will be noon at Antipodes Island, the eastern traveller will call it Saturday, and the western Friday. The reason is as follows: the traveller who goes east, sets out to meet the sun in the morning, and will therefore have that luminary on the meridian (that is, he will have noon) sooner than if he had remained stationary. He therefore shortens his day a little, or, to him, the same absolute time is a larger proportion of the interval between two noons, and by thus gaining a little each day, he is 12 hours before London when he reaches the antipodes. The western traveller, on the contrary, turns his back on the sun in the morning, which is therefore on his meridian later than it

would have been had he remained stationary. Before he reaches the antipodes, he has lost twelve hours; but the other traveller has gained as much, which together makes a whole day's difference in their reckoning. The reader who examines this question will find that, the day always beginning at noon or midnight, it is impossible that the whole world should have the same reckoning. We see, therefore, that the reckoning of a place will depend upon the direction from which the first settlers approached it, and any one who should afterwards join them from the contrary direction would differ from them by a day. Thus, when Dampier reached Mindanao from the west, he was a whole day behind the Europeans he found there, whose ancestors had travelled from the east. And Varenus, a Dutch physician, who travelled in the east about A.D. 1670, states that the Portuguese at Macao were always a day in advance of the Spaniards at the Philippines. The fact was, that the Portuguese came by the Cape and India, and the Spaniards from their American possessions.

Before we conclude this article, we must remark that it would be useful in teaching geography, if the maps of the southern hemisphere had the northern hemisphere drawn upon them in faint outline, *reversed*, in such a way that any one might perceive, at a glance, to what point of the northern hemisphere any point in the southern is antipodal. There is comparatively so little land in the southern hemisphere, that such an addition would not crowd any part of the map too much.

ANTIQUARIES, SOCIETY OF. Mr. Gough, in the introduction to the *Archæologia*, fixes what he considers to have been the earliest foundation of the Society of Antiquaries to the fourteenth year of the reign of Queen Elizabeth, A.D. 1572; when a few eminent scholars, under the auspices of Archbishop Parker and Sir Robert Cotton, united their efforts for the preservation of the ancient monuments of their country. The members met for near twenty years at the house of Sir Robert Cotton, and as early as 1589 determined to apply to Queen Elizabeth for a charter of incorporation; a manuscript still remaining in the Cottonian collection (Titus, b. v. fol. 181) preserves the reasons which were urged at this time in support of the petition. But whether the petition was ever presented, or what was its success, does not appear. The writer of the life of Carew, the Cornish antiquary, says, their hopes were frustrated by the queen's death. This society, however, admitted members till 1604; about which time King James I., alarmed for the arena of his government, and as Hearne conceived for the Established church, thought fit to dissolve it. An attempt to revive the society was made in 1617, in an application for a charter, through the Marquis of Buckingham; but this also appears to have failed.

From this time to the beginning of the eighteenth century the society ceased to exist; or as Mr. Gough expresses it, remained in abeyance.

In 1707, a number of gentlemen, attached in a similar manner to the study of our national antiquities, agreed to meet weekly for the same purposes as the former society, on a Friday evening, at the Bear tavern in the Strand. Among these were Humphrey Wanley; Mr. John Talman; John Bagford; Peter Le Neve, Norroy; Mr. Holmes, the keeper of the Tower records; Madox, the Exchequer antiquary; Mr. Battley; Mr. William Elstob; Stebbing, the editor of Sandford's *Genealogical History*; and Mr. Sanderson, clerk of the Rolls. Le Neve was at this time president. In 1708 they removed their meetings to the Young Devil tavern, in Fleet-street, and soon after to the Fountain tavern over against Chancery-lane. Here they were joined by Samuel and Roger Gale, Dr. William Stukeley, Mr. T. Rymer, Browne Willis, and Austis. The plan of their pursuits, comprising every thing which such a body of men might be expected to do for the illustration of their national antiquities, appears to have been drawn out for them by Humphrey Wanley.

In 1717 the members re-founded, or rather re-constituted, their society, and made their first election of officers; Peter Le Neve, Esq., was president, Dr. William Stukeley, secretary, Mr. Samuel Gale, treasurer, and Mr. John Talman, director. At this time also George Vertue, the engraver, became an active member. The number of members was limited to a hundred, and no honorary members were allowed. The minutes of the society begin January 1, 1718; whence it appears that every member, or whoever was admitted to be present, brought from time to time whatever they had of their own, or their friends, that was curious or

uncommon: as coins, medals, seals, intaglios, cameos, manuscripts, records, rolls, genealogies, pictures, drawings, printed books, extracts, or even memoranda; a few produced dissertations. In 1727 the society removed to apartments in Gray's-Inn, and afterwards to the Temple; and, for a very short period, seemed to decline. In 1728, however, they renewed their meetings at the Mitre tavern in Fleet-street, fixing them to Thursday evenings, after the Royal Society had broken up. In 1753 they removed from the tavern to a house of their own in Chancery-lane.

In 1750, it was unanimously resolved to petition the king for a charter of incorporation on the plan formed in 1717, with improvements. This, by the concurrence of the Earl of Hardwicke, then lord chancellor, was obtained in the following year, when his majesty having declared himself 'Founder and Patron,' the society became incorporated by the name of 'President, Council, and Fellows of the Society of Antiquaries of London'; they were empowered to have a body of statutes and a common seal, and to hold in perpetuity lands, &c., to the yearly value of 1000*l*. The council to consist of twenty-one persons, including the president, and to be elected yearly with the other officers. The first council named in the charter, bearing date November 2, 1751, pursuant to the powers therein given them, re-elected as members the other persons not particularly specified. In 1751 the society determined to have two secretaries. In 1781 the society removed from Chancery-lane to Somerset-place, where his majesty King George III. had been graciously pleased to grant to them, as well as to the Royal Society, appropriate apartments. The Society of Antiquaries held its first meeting there on January the 11th that year.

The anniversary of the society is held on the 23rd of April, when ten of the twenty-one persons of whom the council consist are annually changed. The election of members is by ballot; a certificate having been signed by three or more fellows, is previously exhibited for six successive meetings (including those of proposition and election), except in the cases of peers, members of the privy council, and judges, who may be proposed by a single member, and balloted for upon the same evening. The election is determined by a majority of two-thirds. Every member pays an admission fee of eight guineas, and four guineas a year; or an additional sum of forty guineas to the admission fee, to be constituted a member for life. The society's meetings are held on Thursdays from seven o'clock in the evening till nine, in apartments adjoining to those of the Royal Society, in the front building of Somerset-place. The Royal Society's meetings succeed those of the Antiquaries on the same evenings; and the sessions of the two societies coincide as to time, beginning with the third Thursday in November, and ending with the third Thursday in June. The total number of members of the Society of Antiquaries, A.D. 1823, is 753. The presidents, since the incorporation of the society by charter, have been: 1751, Martin F. Esq.; 1755, Hugh Lord Willoughby, of Parham; 1765, Charles Lattell, LL.D., Bishop of Carlisle; 1768, Jeremiah Milles, D.D., Dean of Exeter; 1784, Edward King Esq. (temporarily elected by the council); 1784, George Ferrars Townshend, Baron de Ferrars of Chartley, afterwards Earl of Leicester and Marquis Townshend; 1812, Sir H. Charles Englefield, Bart. (temporarily elected by the council); 1813, George Earl of Aberdeen, who is still president.

By an act of parliament, 5 Geo. IV., chap. 39, the President of the Society of Antiquaries for the time being is declared to be an official trustee of the British Museum.

The publications of this society as a body have been:— 1. *Vetusta Monumenta*, 4 vols. folio, 1716–1815, vol. v. not completed; and vol. vi., commencing with seventeen coloured plates of the Bayeux tapestry. 2. *Five Dissertations*: one on Doomsday Book, and one on Danegeld, by P. C. Webb, Esq.; two on the Heracleum Table, by Mr. Webb and Dr. Pettingal; one on the Tascia, by Dr. Pettingal; quarto, 1756–63. 3. *Folkes's Tables of English Silver and Gold Coins*, with plates, quarto, Lond., 1763. 4. *Archæologia; or Miscellaneous Tracts relating to Antiquity*, 25 vols., quarto, Lond., 1770–1833. 5. *Liber Quotidianus Contrabulæ Garderobæ, anno regni Regis Edwardi primi vicessimo octavo*, A.D. 1299, 1300 (from a MS. in the society's possession), quarto, Lond., 1788. 6. *A Collection of Ordinances and Regulations for the Government of the Royal Household, made in divers reigns, from King Edward III. to King William and Queen Mary*, quarto, Lond., 1790.

7. *The Military Antiquities of the Romans in Britain*, by the late Major General Roy accompanied with Maps, Plans of Camps and Stations, &c., folio, Lond. 1793. 8. *Some Account of the Collegiate Chapel of St. Stephen at Westminster*, by John Topham, Esq., folio, 1795, with additional Plates, described by Sir H. C. Englefield, folio, 1811. 9. *Account of the Cathedral Church of Exeter, with Plans, Elevations, and Sections*, by Dean Lyttelton and Sir H. C. Englefield, folio, 1797. 10. *Account of the Abbey Church of Bath, with Plans, &c.*, folio. 11. *Some Account of the Cathedral Church of Durham*, folio, 1801. 12. *Some Account of the Cathedral Church of Gloucester*, folio, 1809. 13. *Some Account of the Abbey Church of St. Alban*, by the late Mr. Gough, with Plans, Elevations, &c., folio, 1813. 14. *Cædmon's Metrical Paraphrase of Parts of the Holy Scriptures, in Anglo-Saxon, with an English Translation, and Notes*, by Benj. Thorpe, F.S.A., octavo, Lond. 1832. This last work is the first of a series of publications of Anglo-Saxon and early English literary remains, intended to be edited under the superintendence of a committee of the Society. Layamon's *Translation of Wace's Chronicle of the Brut*, to be edited by Sir Frederick Madden, in two volumes, will form the second work of the series.

Besides the works above-mentioned, the society have published seven historical prints of large size, accompanied by five historical dissertations. The prints are, 1. *Le Champ de Drap d'Or*; or, *the Royal Interview of Henry VIII. and Francis I. between Guisnes and Ardres, A.D. 1520*. 2. *Francis I.'s attempt to invade England, 1545*. 3. *The Embarkation of Henry VIII. at Dover, 1520*. 4. *The Procession of King Edward VI. from the Tower to Westminster*. 5. *The Departure of King Henry VIII. from Calais, July 25, 1544*. 6. *The Encampment of King Henry VIII. at Marquison, July, 1544*. 7. *The Siege of Boulogne by King Henry VIII. 1544*. Also two sets of historical, and some miscellaneous prints, (including Aggas's *Plan of London*.) engraved by Mr. George Vertue, now the property of the Society: with a portrait of *Sir John Huchwood*; and four views of the *Ruins at Stanton Harcourt in Oxfordshire*, drawn and etched by Simon Earl Harcourt.

ANTIQUES, (from the Latin *antiquus*, antient,) a term used in the English language to designate 'antient works of art.' But this definition may be objected to as not sufficiently precise (see ANCIENTS). The term properly refers to works of Grecian art in sculpture, bas-relief, engraving of gems, medals, &c. As these arts flourished in the states of Greece, and also under the Roman Empire, (though most probably they were always successfully cultivated chiefly by Greeks,) it is not possible to find any precise chronological limits that shall determine whether a work of art belongs to the *antique* or not. Still, as there was under the Roman Empire a great and progressive deterioration in the arts above alluded to, until in more recent times they have been again improved, it is clear that many works of considerable antiquity cannot be classed under the head of *antiques*; for by the term *antiques* we understand, in general, works that have decided merit, and may serve as models for imitation; or they are at least works of art that serve to illustrate and explain those antient authors whose writings, by common consent, are allowed to be deserving of study.

ANTIQUITIES. This term seems not to have its meaning very accurately fixed in our language. It is sometimes used as synonymous with *antiques*; but generally it has a wider signification. Books that treat of Greek and Roman antiquities, to which the term is commonly confined, treat not only of works of art, but of political constitutions, judicial and legislative forms, religion, architecture, domestic manners, naval and military affairs, weights and measures, mode of reckoning time, &c. Some of these branches of inquiry are capable of illustration, both from antient writings that remain, and from existing works of antient art; some can only be known to us from the study of antient writings. This extensive signification of the word *antiquities*, though certainly not very precise, still keeps up a distinction between antiquities, as thus understood, and the political history of the Greeks and Romans, and the study of the Greek and Roman languages. Yet we think the common use of the word *antiquities* in this country a bad one, and we should prefer seeing it limited more closely.

The study of *antiquity* is generally understood to mean the study of all that belongs to the Greeks and Romans, of all the knowledge concerning them that has been trans-

mitted to our times: the word *philology* is used in this sense in Germany. Under the general term *antiquity*, then, we may class all the several subjects which it comprehends; such as antient forms of polity, antient systems of philosophy, of astronomy, with political history, antient architecture, sculpture, poetry, &c.

With the increase of our knowledge of the durable memorials which man has left behind him in various parts of the earth, we have applied the term *antiquities* to the monumental remains and to the works of art of numerous nations. We now speak of Egyptian, Persian, Hindoo, Peruvian, and Mexican antiquities, when referring to the works of art existing in these countries, or collected in European museums. The terms Egyptian and Hindoo antiquities, when not specially used with reference to works of art, are also understood as comprehending history, mythology, &c. But unless some qualifying word is prefixed to the term *antiquities*, we generally understand by it, Greek and Roman antiquities.

ANTIQUITY. [See ANCIENTS and ANTIQUITIES.]

ANTIS. A portico is said to be *in antis* when columns stand in a line, in front, with the anteæ or projecting ends of the side walls of the temple or other building. If in the plan of the temple of Ægina [see ÆGINA] the external peristyle or surrounding range of columns were removed, the pronaos and opisthodomus, as there indicated, would be porticoes *in antis*,-- not prostyles. There is a very good example of the portico *in antis* in North-Audky-street, London, forming the entrance to an episcopal chapel there.

ANTI'SCI, an old astronomical term derived from the Greek, signifying those whose shadows are in opposite directions. It is applicable, during part of the year, to any two persons, one or both of whom reside within the tropics; and during the whole year, to any two persons, neither of whom lives within the tropics, and both in different hemispheres.

ANTISCORBUTICS, from *anti*, against, and *scorbutus*, a barbarous word, intended as the Latin for *scurvy*: the remedies, real or reputed, against scurvy. The term *scurvy* is popularly, but incorrectly, given to two distinct diseases, which arise under different circumstances, spring from different causes, present few symptoms in common, and are cured by means not only unlike, but diametrically opposite. The confusion has crept in owing to the skin in true scurvy occasionally, but by no means invariably, peeling off in scales or *scurf*; while in the other disease or diseases, improperly termed scurvy, desquamation, or other affection of the skin, is an essential and invariable symptom, the portions or scales of which being commonly called *scurf*, the adjective *scurfy* has insensibly come to be used as a substantive, and to be applied indiscriminately to the two diseases. The one occurs mostly at sea, hence called sea-scurvy, and is owing to temporary causes, capable of affecting persons of any constitution; the other occurs mostly on land, is owing to more permanent causes, and is always connected with a peculiar constitution. The necessity of making this distinction is manifest, since the remedies for the one disease are few and certainly efficacious, the medicines for the other are multifarious and generally very inefficacious. This circumstance points out an essential difference between the two disorders; and it is of the means of curing the former of these that we here chiefly intend to speak, adding only a few remarks upon those for the latter.

The importance of the naval force to the safety, commerce, and maritime strength of this country, would justify a very lengthened inquiry into the causes of this disease and the means of prevention and cure, if it now prevailed among seamen to the extent that it once did, and if it still continued to impair the strength of the main bulwark of our national defence. The almost total eradication of this malady, however, renders such investigation altogether unnecessary, farther than as a subject of interesting and instructive contemplation.

Of the degree to which this complaint existed, a few instances will serve as proofs. In 1593, Admiral Hawkins stated it to be consistent with his personal knowledge that 10,000 men had perished of scurvy; at a much later period, Commodore Anson, in the course of his voyage round the world, lost above four-fifths of his men, and when he arrived at Juan Fernandez, of the two hundred men then surviving, eight only were capable of duty. An entire crew has sometimes fallen a victim to it, and the ship been left without a single hand to guide it through the waters. This happened

in the case of the Spanish ship *Oriflamme*, in which the whole crew perished, and in this state she was discovered with the dead bodies on board.

As a means of contrast it may be stated that, in the year 1780, there were admitted into the Royal Haslar Hospital at Portsmouth, under the care of the physicians, 8143 cases of disease, of which scurvy formed 1457; while, during four years, namely, 1806, 1807, 1808, and 1809, into the Royal Naval Hospital at Plymouth, there were admitted under the care of one of the physicians 1984 cases of disease, of which two only were scurvy. During nine years of warfare, namely, between 1778 and 1795, the number of men voted by parliament for the naval service was 745,000; of these, 188,730, a large proportion of which number consisted of men affected with scurvy, were sent sick to hospitals or on shore; while, during nine consecutive years of warfare, namely, from 1796 to 1806, the number of men voted for the naval service was 1,053,076, of whom there were sent sick only 123,949, a difference mainly owing to the disappearance of scurvy.

Let us inquire what were the causes which produced this dreadful disease, and formerly rendered it so frequent; and what are the circumstances which have contributed to its abatement or disappearance, and which now secure to our seamen so gratifying an immunity from it. Before doing this, it will be proper to give a short detail of the symptoms. Under the influence of the concurring causes, an individual began to lose his natural and healthy colour: the skin, first of the face, and afterwards of the rest of the body, became pale, and assumed a bloated appearance; the lips, instead of a rich vermilion, acquired a greenish tinge: indeed, the countenance in this disease is always very much depressed, indicating a corresponding state of mind. The patient is conscious of weariness, and is averse to exertion; and when that of a bodily kind is attempted, his unfitness for it is seen by the weakness of the knees (which often become stiff and contracted) and of the whole muscular system, greatly increased frequency of breathing following the least effort. The skin is dry, sometimes rough, but more generally smooth and shining, with spots of a red, blue, or black appearance, according to the length of time that the blood has escaped from the vessels, which is the cause of these stains. The limbs become dropsical, the gums spongy and swollen; ulcers or any sores, cuts or scratches, bleed profusely, and cannot be healed; even old ulcers break out anew, and broken limbs, apparently firmly united, separate again, and cannot be reunited so long as the disorder continues. The blood when drawn scarcely coagulates, but remains loose and flabby; yet during the whole of this state the appetite generally continues good. These symptoms all denote great debility, which is occasioned by a peculiar alteration of the blood, and is produced by the causes we have now to mention.

One of the most extensive and powerful causes of debility is constant exposure to a cold and damp atmosphere. The construction of ships was formerly such that the sailors were continually exposed to the operation of this cause, which was further aided by the unwholesome exhalations from the bilge-water, the sand used for ballast, and the remains of animal and vegetable matter which were strewed about the ship: no means of removing or lessening these causes existed, from the utter absence or imperfect nature of the means of ventilating the ship, or washing it, without increasing the dampness. The sailors were also very inattentive to personal cleanliness, were unprovided with soap, and were too insensible of the advantage of changing their dress when wet, and were also without the opportunity of changing or washing and airing their bedding. The measures adopted by Captain Cook, on the occasion of his second voyage round the world, were very similar to those since universally pursued. Out of 318 men, during a voyage of three years and eighteen days, throughout all climates, from fifty-two degrees north to seventy-one degrees south, he lost only one. For this, in the year 1776, he received from the Royal Society the Copley medal. (See *Kettler's Life of Cook*, 1788, p. 315.)

By the change effected by Sir Robert Seppings in the construction of ships, and the substitution of iron instead of wood for ballast, and of iron tanks instead of casks for water; by the efficient means he has devised for ventilating the ship, without exposing the persons of the sailors to cold; and by the employment of portable iron fire-places in different parts of the ship, as well as by a change of bedding, and

a proper allowance of soap to each sailor—these debilitating causes no longer exist, or are rendered powerless.

Another cause of debility was either excessive fatigue or deficiency of proper and regular exercise; the former cannot always be avoided, as in the case of much bad weather, when the labour of all hands is increased, or great sickness among the crew, which requires more exertion on the part of the healthy. But deficient exercise can always be avoided by the officers finding employment, or inventing amusing occupation, for the sailors, and above all for the marines, who, having less active duty in the ship, were the most frequently attacked by scurvy. Intemperance also greatly contributed to prepare the system for a scorbutic attack, but this vice is now much repressed.

None of these causes singly, nor indeed all of them combined, are adequate to produce scurvy, unassisted by some specific cause, which cause is to be found in the diet. The diet of seamen during long voyages was formerly merely salted meat and biscuit; fresh animal food or recent vegetables formed no part of it. It was also often deficient in quantity.

Salt, if taken in moderation, facilitates digestion, but if in excess, hinders the digestion of the food, even of fresh meat and vegetables: when employed as a means of preserving meat, it hardens it, and impairs its nutritive power, as well as renders it more difficult to digest. Such meat is less nourishing, but more stimulating, than fresh meat, and its long-continued use produces what may be termed the *disjunctive* inflammation, owing to which old wounds and ulcers break open, and fractured bones separate after reunion. The salt seems to be pernicious in a two-fold way, first, by lessening the nutritious power of the meat; and secondly, by its stimulating properties. The former of these, unaided by the latter, is sufficient to produce scurvy, if the predisposing causes of cold, moisture, and imperfect or excessive exercise be in operation. The diminution of the quantity of food, and not its quality, was the principal exciting cause of scurvy in the Milbank Penitentiary in 1819. [See ABSTINENCE.]

In what way the absence or inadequate supply of fresh vegetables operates has not been ascertained. That the deficiency of this article of nutriment has a large share in producing scurvy is established by the facts, that before the extensive introduction of esculent vegetables into Britain, scurvy was almost as common on land as at sea; and also by the rapid disappearance of scurvy from among the crews of ships, so soon as they procure a supply of vegetable articles of diet of any kind, but more particularly those belonging to certain tribes of vegetables,—as the hesperideæ or aurantiaceæ (the orange tribe), the grossulariaceæ, or gooseberry tribe, which are all acid vegetables; and the crucifera, or mustard tribe, containing cabbages (whence *sour-kraut* is prepared) and the well known scurvy-grass, which are alkaliescent vegetables; the coniferæ, some of which yield spruce: &c.

These vegetables, or the articles prepared from them, constitute the *antiscurbutics*, or means of preventing and curing sea-scurvy; but they are not all of equal value, some far surpassing the others in efficacy. Those are the least valuable in which no vegetable acid greatly predominates, so as to impart to them an acid or acidulous taste. Hence the crucifera are not so useful in their natural state, as the name of *scurvy-grass*, bestowed on one of them, would seem to indicate; but when by their fermentation, as that of cabbages to form *sour-kraut*, a vegetable acid (acetic acid? or vinegar) is produced, they rise in the scale of antiscurbutic power. But at the head of all, the hesperideæ deserve to be placed, the members of which contain citric acid: accordingly any of the species may be employed; but the most powerful belong to the genus *citrus*, especially the *citrus limonum* (Risso), the well-known lemon, since the introduction of which into the navy, in 1796, scurvy has almost ceased. It may be used in various ways; the best is in the form of the fresh fruit, sucked by the patient: but in the absence of this, lemon-juice may be employed, and this is the usual mode in the naval practice. Several gallons of it, having a tenth-part of spirit of wine added to preserve it, are supplied to each ship, and in about a fortnight after leaving port, its use is begun; each sailor is allowed one ounce of it and one ounce and a half of sugar to mix with the grog, or in many instances with wine, a stated quantity of which is granted in lieu of a certain quantity of spirits, which is withdrawn. This has

the effect of almost invariably preventing scurvy affecting any of the crew; but should symptoms of the disease begin to show themselves, they quickly disappear by an increase of the quantity of lemon-juice. Citric acid, which has been crystallized and again dissolved in water, is not so efficacious: neither is vinegar, nor any other vegetable acid, such as tartaric, or malic, so useful, though the fruits containing them (unripe gooseberries, tamarinds) are the best substitutes for lemons, when these cannot be procured.

No one, as far as we know, has attempted to explain how these vegetable acids produce their beneficial effects. It may be remarked, however, that all acid fruits have a very cooling and soothing effect in many complaints: they are among the most useful refrigerants, and often sit on the stomach and restore its power, when in a very irritable or weakened state. This is particularly the case where the powers of the stomach and nervous system have been much impaired by intemperance, especially from the abuse of spirituous liquors, in which tartaric acid is eminently serviceable; even during a fit of intoxication, a draught of vinegar will restore the drunken man to his senses more speedily than any other means. These acids appear to exert a very considerable vital action on the system generally, but especially on the nervous centres. Further, lemon-juice and vinegar exercise a chemical influence on many articles of food difficult of digestion, as veal; hence the practice of serving these articles to table, accompanied by one or other of these acids. If the salt has rendered the meat hard and difficult of digestion, may not these acids produce some change in it, rendering it less so by their chemical properties, as well as by their general action, heightening or increasing the vitality of the stomach, and consequently its power of extracting the nourishment? Some local effect is produced by the direct application of lemon juice, as slices of lemon placed on the ulcers hasten the healing processes.

Mineral acids, such as elixir of vitriol, are found less useful, though they and other strengthening medicines, such as sulphate of quinine, may occasionally prove serviceable, when lemon juice is wanting, or fails in effecting a cure, which has happened in some very rare instances. An instance occurred in 1822, on board his majesty's ship *Leander*, where, however, probably some undiscovered cause of scurvy existed about the ship; for we cannot suppose the want of success to have depended on peculiarity of constitution where so many men resisted the curative influence of the medicine. (See also Bumpfield on *Tropical Dysentery*.) Chloride of soda appears to have some claim to a favourable regard; but at present we have too little experience of it, in this respect, to speak positively of its antiscorbutic power.

In addition to the lemon-juice, ships intended to be sent on long voyages are supplied with animal food so prepared, as to be almost as fresh at the end of six years, as if it had been killed but a few days and dressed the day previous to its being used. This valuable discovery, which tends so greatly to lessen the inconvenience of a sea-life, as well as to secure the health of those devoted to it, was made by Mr. Appert: the mode of effecting it, and the principle on which it depends, will be explained under ANTISEPTICS.

After every fair degree of merit is assigned to other means and articles, the main instrument of banishing scurvy from among the number of diseases incident to a sea-life has been the liberal use of lemon-juice. The nation owes a deep debt of gratitude to those who effected its universal introduction into the naval service, and who yet live to witness the beneficial effects of their enlightened views; these are Earl Spencer, who was first lord of the Admiralty in 1793, and the benevolent, and now venerable, Sir Gilbert Blane, physician to the fleet, and at the head of the Navy Medical Board in 1793. But for their exertions our navy could not, during the twenty years of the war which followed that date, have achieved those victories which have rendered our country so illustrious. Had the mortality in the navy, throughout these twenty years, been equal to what it was in 1779, the whole stock of seamen would have been exhausted. (See paper on the comparative health of the British navy, by Sir Gilbert Blane, in his *Select Dissertations on Medical Science*, London, 1822; also in vol. vi. of *Transactions of the Medico-Chirurgical Society*.)

The historian of Anson's voyage, speaking of scurvy, says, 'the cure seems impossible by any remedy or by any management that can be employed.' In the present day, instead of the remedy being unknown, it is, happily, the disease:

a fact which suggests the most important subject for contemplation, and justifies the reflections and language of Sir Gilbert Blane: 'does it not afford a cheering and consolatory prospect, "amidst the thousand shocks that flesh is heir to," that there may be still in store for us, in the boundless progression and endless combinations of knowledge, other hidden means of advancing human happiness, of mitigating human misery, and of making accessions to the dominion of man over nature which have not yet been dreamt of in our philosophy.'

The other diseases to which the name of scurvy has been improperly given, and some of the remedies for which are termed antiscorbutics, have no connexion with sea-scurvy, or its remedies. These various affections of the skin are more or less connected with a serofulous constitution, to which are owing the disordered functions of the digestion, whence these eruptions spring. Acidity in the stomach is a concomitant and characteristic symptom of these diseases, for the cure of which vegetable acids are unavailing, though the mineral acids, by their strengthening virtues, are often serviceable. These so-called scorbutic affections are of very frequent occurrence among persons subject to gravel and gout, which are, at the commencement, caused by acidity in the stomach: the appropriate means of cure for both complaints are alkalies (see ANTACIDS), the very opposite of the means useful in true scurvy.

The nostrums vended under the name of antiscorbutics, and intended for these cutaneous diseases, though varying in their composition, mostly contain, as their active principle, some preparation of mercury, often a very poisonous one, which is always hurtful in sea-scurvy, and can only be serviceable in particular cases of the other kinds. Its use requires the greatest caution, directed by the utmost skill: the employment of such articles should, therefore, be carefully avoided.

ANTISEPTICS, from *anti* against, and *sepsis* to putrefy, the means of preventing those changes in organized matter which are comprehended under the term putrefaction. All organized bodies consist of different materials, which are designated their *proximate principles*, and these again are formed by the union or combination of certain *ultimate principles*. An organized body, therefore, is always a compound one, and the tendency of its original or natural proximate principles to form others, and, at last, to be resolved into the ultimate elements of which they are formed, is the occasion of putrefaction, which takes place in all bodies, sooner or later, according to the circumstances in which they are placed. To give an example of each: flour, prepared from what was once a living and organized body, called a seed, contains two proximate principles, gluten (bird-lime) and starch: each of these is resolvable into definite combinations of what are termed simple or *elementary* bodies, of the same nature as the constituents of inert or inorganic matter: the most common of these are *oxygen*, *hydrogen*, *carbon*, and *nitrogen*. The first or proximate principles are only met with in organized bodies; the latter equally in organized and inorganic matter. Oxygen, for instance, forms a portion of the air which we breathe, and also of water; hydrogen forms a portion, or is an element, of water; nitrogen is found in the atmospheric air; and carbon exists in the diamond, in the charcoal obtained from wood, or from animal matter.

All organized bodies spring from parents similar to themselves, possessed of, or endowed with, a vital principle. Every such body possesses the power of assimilating to itself matter introduced from without, whether inorganic, as table-salt, or organized matter, as dead animal and vegetable substances, in the case of man and some other animals, or merely inorganic matter, as in the case of vegetables. After being received into the interior of the body, these matters undergo changes previous to being distributed to that part of the frame destined for the reception of the different proximate principles which are formed out of them by the vital processes of digestion and assimilation. When deposited in the part intended for them, they would speedily enter into fresh combinations, were not their tendency to do so controlled by the agency of the living principle, which counteracts the usual chemical affinities of the constituent or elementary principles. When this principle is weak, or does not act with sufficient energy, either through the whole frame or in any particular part of it, the elementary principles manifest a disposition to exert their ordinary affinities, which would lead to the decompo-

sition of a part or the whole. Partial decomposition occurs when a limb or other part of the body has been the seat of such violent inflammatory action that its structure is changed, and its vitality destroyed, so that it *sloughs*, as it is technically called, that is, becomes dead: complete decomposition occurs when the vital principle quits the entire frame, *i. e.* when death of the whole body takes place, and putrefaction begins. But the presence of the vital principle does not always hinder the commencement of putrefaction, as we see the tendency to it manifested in the worst kinds of fevers several days before dissolution: on this account they were termed *putrid fevers*, and were conceived to be owing to putrescency of the fluids, a doctrine common during the prevalence of the *humoral* pathology. But more correct views of fever have taught us that the changes in the fluids, both as respects their properties and chemical constitution, are consequent upon a change in the vital action of the system, resulting from the impression of a powerfully morbid agent on the nervous or circulatory systems. This impairs the vital force or energy of the frame, and lessens the power by which the chemical affinities were controlled; and hence the early tendency to putrefaction in persons affected with fevers of a typhoid type or character.

The complete departure of the vital principle is not sufficient to occasion the commencement or ensure the continuance of the processes of putrefaction: the concurrence of several other circumstances is necessary. These are air, heat, and moisture: if any one of these be wanting, decomposition will in general be prevented. If the air has an admixture of certain particles or principles, the tendency to putrefaction will be greatly increased; and, on the other hand, impregnating the air with certain other principles, greatly lessens the disposition to decomposition. These circumstances have so large a share in the production or prevention of disease and death, that a thorough understanding of them is of vast importance to the welfare of the community.

The atmospheric air, considered in reference to its chemical composition, is a mixture of nitrogen and oxygen gases, in fixed and uniform proportion, with carbonic acid gas in a small and variable proportion. But close to the surface of the earth, it receives an admixture of particles or principles of different kinds, by which it is contaminated, and rendered less fit for the support of animal and vegetable life. By the respiration of animals, particularly of warm-blooded animals, as man, a portion of the oxygen is withdrawn, and a corresponding portion of carbonic acid gas is substituted in its place. By the respiration of plants, the carbonic acid gas is withdrawn, and an equivalent portion of oxygen substituted. By the mutual action of the members of the animal and vegetable kingdoms, the balance of the constituent elements of the atmosphere is maintained. But by a preponderance of the members of either of these kingdoms, an excess of the one principle and a deficiency of the other will be occasioned. Hence, where there is a large assemblage of men, the air is less fit for respiration, as happens in close apartments: the most melancholy example of this is to be found in the narrative of the Black Hole at Calcutta; of one hundred and forty-six persons confined in this dreadful place, *one hundred and twenty-three* perished during one night. Trees crowded together in plantations suffer more from deficiency of carbonic acid and oxygen, both of which are required for respiration, than from deficient nutriment by the roots—a fact of which proprietors and managers of timber-plantations are either not aware, or at least they neglect the practice to which it should lead. It may be remarked by every one that on the coast, where animal life acquires an accession of strength from the purity of the air, which abounds in oxygen, vegetable life languishes from the deficiency of carbonic acid. In addition to these sources of deterioration, the air is contaminated by various other means, some occasional and limited in their operation, others more constant and extended in their influence. A brief review of these will here be proper; but, before proceeding to enumerate them, it will afford conclusive evidence of their importance to adduce one example of the influence of even a slight admixture of a deleterious principle with the ordinary constituents of the air. This gas (hydro-chloric acid, or muriatic acid gas) must therefore be very injurious to vegetable life, since so small a quantity as a fifth of an inch, though diluted with 10,000 parts of air, destroyed the whole vegetation of a plant of considerable size in less than two days.

Nay, we afterwards found that a *tenth part of a cubic inch in 20,000 volumes of air* had nearly the same effects. Drs. Turner and Christison, in *Brewster's Journal*, vol. viii. p. 145.

These are principles with the chemical qualities of which we are well acquainted, and the sources of which we can easily ascertain, and often remove; but there exist others, of the nature and origin of which far less is known, though their effects are very conspicuous: such are the exhalations from decaying vegetable matter, termed marsh miasmata, or malaria, and the exhalations from the bodies of men and animals, when crowded together, or from that of men labouring under certain diseases, as fevers, called the matter of contagion, or from dead animal matter, in a state of putrefaction, termed putrid effluvia. These are the fertile sources of fevers, whatever their form, type, or appellation; and though it is commonly thought that the fevers from vegetable matter are always of an intermittent or remittent character, yet they often assume the continued form (see *Ague*); while the effluvia from animal matter mostly give rise to fevers of a continued and typhoid character.

What the precise nature of this deleterious principle is cannot be stated, but whatever it be, when received in sufficient quantity into the human system, it seems to act as a ferment or yeast, and produces a series of changes, the ultimate object of which is to reduce the body attacked to a state of putrefaction. We have no test of its presence beyond its effects, but we know the sources whence it springs, and the circumstances which favour its concentration, and occasion the human frame to become more susceptible of its influence. It is only by removing or lessening these that we can escape this insidious foe, and the success which has attended the enlightened measures proposed by physicians and chemists should lead to their extended application.

Long-continued calms, in which there is a stagnation of the air, and during which fresh and purer particles of the atmospheric principles do not descend from the higher regions to replace the heated and contaminated air near the surface of the earth, conduce much to the concentration and virulence of these agents. For several weeks before the plague broke out in London, in 1665, there was an uninterrupted calm, so that there was not even sufficient motion in the air to turn a vane. And at the season in which the last plague visited Vienna there had been no wind for three months. To produce agitation in the air, fires were formerly lighted, and pieces of artillery discharged, means altogether inefficient to cause a considerable commotion in the atmosphere at large, though a fire is extremely serviceable in renewing the air of apartments in houses: the only means adequate to this end are beyond our control, though they frequently take place at the moments of the utmost need; these are storms and hurricanes, which, however desolating in their immediate effects, are instruments of great, though less obvious, good. After the hurricane which proved so destructive to the inhabitants of the West Indies in 1780, less disease occurred than had been known before; even those who laboured under sickness at the time were benefited by it; fever, diarrhoea, and dysenteries, but, above all, disorders affecting the lungs, were cured. Cases of intermittent fever were observed to be cured by an earthquake at Caracas in March, 1812. (See Brande's *Quarterly Journal of Science* for 1817, vol. ii. p. 401.) After the excitation of a storm, plants give out more oxygen, which accounts for the delightful and life-giving freshness of the air, of which every one is sensible, who walks out into the fields immediately afterwards.

We may imitate nature, and employ ventilation on a small scale, but with the best effects, in our dwelling-places, hospitals, and sick-rooms. The evils of neglecting this salutary measure contrast strikingly with the beneficial consequences of attending to it. It is remarked by Dr. Macculloch, in his *Account of the Hebrides*, that while the inhabitants had no shelter but huts of the most simple construction, which afforded free passage for currents of air, they were not subject to fevers; but when, through the good intentions of the proprietors, such habitations were provided as seemed more comfortable and commodious, but which afforded recesses for stagnating air and impurities, which they had not the means, or had not a sufficient love of cleanliness, to remove, febrile infection was generated. The mortal fevers which have occurred from crowding human beings together in small ill-ventilated apartments are numerous. They were termed jail and hos-

pital-fevers, from their infesting these places. the survivors of the night in the Black Hole of Calcutta were, almost without a single exception, attacked by fever; and the unhappy victims of the mercenary actors in the slave-trade were often released from suffering by the fevers which resulted from crowding so many into a confined space. To avert such calamitous diseases, we must have recourse to measures which will lessen or remove their causes; such as dispersion of the inhabitants or patients over a larger space; enforcing cleanliness of the apartments and of their persons, and freely ventilating every room. Formerly, in the hospital at Leeds, no patient suffering from compound fracture or other severe accident survived, till the ventilation of the wards was improved. One of the most convincing proofs of the different influence of foul and pure air is to be found in the *Report of the Lying-in Hospital of Dublin*. In the space of four years, ending in 1784, in a badly-ventilated house, there died 2944 children out of 7650. But after freer ventilation, the deaths in the same period of time, and in a like number of children, amounted only to 279. Attention to this point will prove a protection from numerous causes of disease. The annual mortality of Manchester in 1757 was 1 in 25, and in 1779, 1 in 28; but in 1811 it was 1 in 74, a change mainly attributable to the improvements in ventilation effected by Drs. Percival and Ferriar.

Stagnant water, and the mud which remains after it has evaporated, marshes and places occasionally overflowed, emit exhalations not less noxious than those from decaying animal matter, or the bodies of human beings. These are the more powerful in proportion to the heat; hence, in tropical and warm countries, they give rise to the yellow-fever and the jungle-fever, which are rapid in their course, and generally fatal in their close: in colder countries they produce continued remittent and intermittent fevers. The exhalations are always less hurtful in proportion to the activity of the vegetation. The inhabitants of that part of the town of Batavia which is nearest the mud and slime left by the tide suffer more from fevers than those who dwell next the marshes, unhealthy as these are. In the marshes of Anké, a great number of different kinds of grasses, rushes, &c., grow, and the spaces between these plants are covered with large quantities of the *Pistia stratiotes*, the leaves of which float on the surface of the water, and absorb a great quantity of the noxious vapours as fast as they are exhaled, and change them, by the aid of the sun's rays, into respirable air. This change is effected by the pistia more than by any other plant; for it is known from experiments to be so powerful a preventive of decomposition of stagnant water, that if fishes be put into a small quantity of water, in which they would otherwise perish in the course of a few days, they may be preserved alive for a long time by covering its surface with these singular plants. The utility of a piece of moss introduced into the vase where gold fishes are kept is well known; and the *lemna* or duckweed, and other plants which cover the surface of ponds in summer, render a similar service to the air here, which the pistia does to that around Batavia. Where marshes cannot be drained, the planting them with marsh and aquatic plants, and such trees as alders and poplars, is the best mode of mitigating the evils which result from them. The beneficial effects of draining and forming under-ground sewers are shown in the perfect immunity which London enjoys from ague as an epidemic, contrasted with former times. Dr. Caius, the most eminent physician in England at that period, states, that the mortality of London from ague in 1558 was such, that the living could hardly bury the dead.

When these natural means of preventing animal and vegetable exhalations cannot be employed, we must have recourse to artificial means of disarming them of their potency. Of the measures formerly resorted to for this purpose, some were useless, while others were hurtful to the sick, and could not be practised without the removal of the patients, which can rarely be accomplished. All of them, in point of efficacy and facility of application, fall short of two agents, which bid fair to render every other superfluous: these are the chlorides of soda and of lime. In these preparations chlorine is combined with the bases in such a way as to be susceptible of decomposition, and is evolved with more or less rapidity according to the ingredients or impurities it meets with in the air. The most common of these impurities is carbonic acid gas, which is produced both by the respiration of living animals, and by the decomposition of

their bodies when dead. Another product of putrid animal matter is ammoniacal gas, which generally unites with the carbonic acid, and forms carbonate of ammonia, the presence of which may be recognized by the pungency of the air impregnated with it, which affects both the eyes and the organ of smell. Now it is interesting to remark, that carbonic acid gas has the greatest tendency to unite with the soda or the lime, and to liberate the chlorine. Again, chlorine decomposes ammoniacal gas by abstracting the hydrogen from the nitrogen, and forming hydro-chloric or muriatic acid. One example of its beneficial action will prove its utility. Air was passed through blood, which had been left to putrefy for eight days; being then passed through a solution of the chloride of lime, carbonate of lime was deposited, and the air was rendered inodorous and completely purified. These agents can only be productive of benefit within a limited range of atmosphere, yet they may be employed successfully to purify the air of hospitals, sick-rooms, &c.

Quick-lime, or charcoal recently prepared, has been employed to absorb fetid and noxious exhalations, and though inferior to the chlorides, may be used in some cases, such as when the patient cannot bear the smell either of the chloride of soda or of lime. When the matter of contagion is supposed to be attached to woollen or cotton clothes, we may expose these to a high temperature, 212° of Fahrenheit, for some hours, by which it will be dissipated.

An equally important means of warding off the effects of exposure to a contagious atmosphere, is to put the body in a posture of defence by strengthening it, and regulating the general health. Increasing the vital force of the system renders it less susceptible of being acted upon by impure air; hence nourishing food and tonic medicines may be regarded as indirectly antiseptics. It is a wise precaution not to visit the sick without previously taking food. But useful as a supply of proper nourishment is, still it is of inferior efficacy, as a protective means, compared with ventilation and cleanliness, as is demonstrated by the instructive fact, that in Great Britain, we were 200 years later in getting rid of pestilence than of famine. Most of the medicines which were formerly termed antiseptics are either tonics or refrigerants: of which cinchona bark may serve as an example of the first class, and the mineral and vegetable acids, as dilute sulphuric acid, and tartaric acid or citric acid of the second. Tonic antiseptics cannot be employed with propriety or safety at the beginning of fevers or inflammatory complaints, but in many diseases a period arrives when they may be usefully administered. The period when their employment becomes safe requires the nicest discrimination on the part of the medical attendant; and too numerous are the instances where their premature employment has rekindled the disease which might otherwise speedily have subsided. We are, however, justified in having recourse to them at an earlier period in those diseases which we know to have a great tendency to lead rapidly to the death of some part; such as in the malignant or putrid sore-throat of scarlet fever; or in continued fever of a very typhoid character.

The refrigerating antiseptics may be beneficially used from a very early period of inflammatory diseases, especially of the young and robust: in such diseases as scurvy (i.e. sea-scurvy) they surpass all other remedies.

As the operations of nature in regard to organized matter seem to consist in reducing to their elementary state each individual, or part, when it ceases to live, and in reconstructing others, it forms an interesting and important subject of investigation to inquire in what way the former of these may be prevented, when it is desirable to preserve the whole or a part of organized matter from putrefaction; by what means can the tendency to putrefaction be so modified, that the result of it, though leading to the formation of a substance having a very different character, shall yet be of a kind which may be preserved for a longer period, than the original substance; and how the process of putrefaction may be rendered a useful, instead of a noxious, operation. The first two questions concern the preservation of food, so that the produce of a period of plenty may be stored up as a provision for a time of scarcity, and the superabundant productions of one country may be transmitted in a sound and wholesome state to a distant land. It also concerns the provisioning of our ships, so as to ensure the health of the crews, as far as depends upon a proper supply of animal and vegetable diet. The last question relates to the beneficial application of putrefying materials to the soil as manures.

All organised substances do not putrefy with equal rapidity, nor under all circumstances. Decomposition goes on fastest in substances which contain nitrogen; most slowly in substances which contain carbon: hence animal matters putrefy quickly; vegetable, especially of a woody texture, gradually: the decomposition of the former is characterized by an unpleasant odour, and the formation of ammonia; that of the latter is rarely unpleasant, except it be of vegetables which contain nitrogen, such as cabbages and fungi. The conditions necessary for the process of putrefaction to take place are, the presence of air, of a certain temperature, and moisture. If any one of these be excluded, the process is prevented. The moisture may either be external, or it may be the fluids of the body itself. The bulk of the animal frame is made up of fluids the preponderance of which over the solids is strikingly illustrated by an entire, but perfectly dry, natural mummy of a full grown native of the island of Teneriffe; though all the solid parts of it are preserved, it does not exceed seven pounds and a half in weight. The fluids must either be dissipated by heat, abstracted from the body by some chemical process, or rendered solid by a very low temperature, if we wish to preserve any animal substance in the state most near that of its natural constitution. For the sake of clearness, we shall here speak of the modes of preserving food under two heads, the natural and the artificial.

The former modes comprehend those which effect this end by abstracting or excluding one or more of the chief agents,—heat, moisture, and air,—and furnishes the answer to our first question; the latter comprehend those methods of preparation or mixture which may be considered to be the answer to the second question.

1st. Abstraction of heat. The presence of heat is essential to the exertion of those chemical affinities which take place during, or constitute the process of, decomposition; abstracting it, therefore, checks or suspends them; most articles of food keep better in cold than in warm weather. When the heat has been so completely abstracted that the juices are frozen, i.e., become solid, the preservation of the substance is more effectually accomplished. Indeed they may thus be preserved for a time almost beyond belief. In the year 1779, on the shores of the Frozen Ocean, near the mouth of the river Lena, an animal of immense size was discovered imbedded in ice, which, as it melted, gradually disclosed him to view. His hair, skin, and flesh were in so good a state of preservation, that dogs and many wild animals preyed upon it. (Some of the hair may be seen in the museum of the Royal College of Surgeons, Lincoln's-inn-fields.) In the opinion of Cuvier, this animal differs from every known species of elephant, and is, therefore, considered by him as *antediluvian*, and to have been preserved from the remote period of the deluge in the mass of ice which enveloped him.

On this principle the Russians preserve their poultry, which they kill in October, and pack in tubs with layers of snow between. The markets of St. Petersburg are supplied with veal brought from a great distance in this state, as well as with whole hogs, sheep, and fish. The Canadians preserve their provisions in the same way. Almost the only instance in which we adopt this practice is sending fish from Scotland to London; but it might be employed for the preservation of many other articles, eggs for example.

A precaution is necessary in thawing them; for this end, they should always be put into cold water first. Indeed, in the case of persons lost in the snow, recovery is much more likely to be brought about by plunging the individual into cold water, than by placing him in a warm bed.

This method of preserving food is not applicable to vegetables, but when these are frozen they should also be first put into cold water.

2nd. The abstraction of moisture by heat is employed in drying fish and other animal substances, as beef, bacon, &c., though in these the rapid tendency to putrefaction makes the employment of a certain quantity of salt, &c., along with desiccation necessary, unless the process be carried on with great rapidity, which may be effected by a high temperature and a free circulation of air. Hence in many places, where turf or peat is burnt, hams are hung within the wide kitchen-chimney; but, by this means, the juices are dissipated, and, consequently, the flavour, as well as nutritious property, of the meat is lessened, and its indigestibility is increased. This method is better suited for the preservation

of vegetable substances, such as grain, hay, &c. It is by this means that botanists preserve plants to form a hortus siccus, or herbarium, and many plants are preserved for medical use. But in the case of these last, a high temperature should never be applied, as it dissipates their active principles.

3rd. The exclusion of sources of oxygen gas constitutes another means of effecting the end in view; and as the atmospheric air is the most common, as well as universal source of oxygen, we shall limit our remarks to the means of excluding it. The influence of this is very great. Réaumur varnished some eggs, and found that at the end of two years, they were yet capable of producing chickens; and Bomare mentions an instance where three eggs were inclosed within the walls of a church in the Milanese, and when found at the end of 300 years, they had not lost their flavour. On this principle butter is rubbed by careful housewives over their eggs; lime-water, however, is the best medium in which to place eggs for long keeping. But more valuable articles than eggs are preserved by this means; and in a condition nearly equal to their fresh state. We allude to the method of preserving animal food and vegetables, promulgated by M. Appert. This consists in boiling the articles (if meat, the bones must be first taken out) to nearly as great a degree as if intended for immediate consumption; they are then put into jars, or now generally into tin canisters, which must be completely filled with a broth or jelly prepared from portions of the same meat. The jars are then corked and covered with a luting formed of quicklime and cheese, or if canisters be used, these are carefully soldered down. After this, they are placed in a boiler of cold water, to which heat is then applied till the water boils, and the boiling of which is continued for an hour; the fire must then be instantly extinguished, and the water soon drawn off, but the boiler must not be uncovered, or the bottles taken out for one or two hours after.

By this method meat may be kept sound and well-flavoured for six years, or even longer, and sent to any part of the globe. (See Appert, *Art of Preserving Animal and Vegetable Substances*, London, 1811.)

The natural methods of preserving organized substances are few and simple; the artificial more numerous, as well as more complex. They consist either in causing such changes in the elementary constitution of a body as shall form a new and less destructible article, or by introducing some additional principle which shall hinder the exercise of the natural tendencies or affinities of the elements of the substance.

The first set of means constitute the various kinds of fermentation, of which this is not the place to treat, but with respect to which we may remark that the products of them are not only little disposed to undergo decomposition, but have also a powerful effect in preventing other substances from undergoing it; the most remarkable of these are acetic acid or vinegar, and alcohol. The mode of action of vinegar or pyroligneous acid in preventing the decomposition of animal and vegetable substances has not been determined, but alcohol is supposed to act by abstracting the elements of water. The formation of sugar, which is another product of fermentation, is a powerful means of preserving fruits, in which it is formed spontaneously, or to which it is afterwards added. Fruits are ripened by the conversion of the acid which they contain into sugar, and as this requires the aid of light and heat, fruits gathered in the afternoon are less acid than if gathered in the morning, and keep much better. The addition of sugar is practised in forming syrups, jellies, and preserves.

Those parts of plants which contain much carbon last the longest, whether dead or alive: many vegetable structures have been preserved entire, embedded in charcoal, in the most ancient coal formations; and in bogs and moorlands, trees are met with, having a perfect integrity of structure. Even in trees cut down and exposed to air and moisture, the bark, which contains most carbon, endures after the rest has perished. The seed also contains much carbon, and owing to this retains its vegetative power often for a hundred years or more. When seeds are sent from India to England, they are always wrapped in recently prepared charcoal. When stakes or piles of wood are to be driven into the beds of rivers or marshes, they are previously charred; and to preserve water sent to sea, the inner side of the cask is also charred. A more perfect mode of preserving water from becoming

putrid, is to saturate it with fresh lime, (and in this lime-water, eggs for use at sea may be kept :) when the water is needed, the addition of a few drops of sulphuric acid (oil of vitriol) will precipitate the lime, and leave the water pure and wholesome. But for this purpose it must be carefully closed against the admission of the air, otherwise the lime will be precipitated by abstracting carbonic acid from the air.

There are many substances which when added to animal matter prevent for a longer or shorter time their decomposition, such as salt-petre (nitrate of potass), and common salt (chloride of sodium), which last is supposed to act by abstracting the elements of water ; certain it is that meat is rendered by salting much drier, harder, less easily digested, and consequently less nourishing. [See ANTISCORBUICS.] Many aromatic substances have a similar power of preventing putrefaction for a time. They were extensively employed in embalming in ancient as well as modern times, as the Egyptian mummies prove. Oils and resinous substances long resist putrefaction, and preserve other substances from it ; bitumen, naphtha, and empyreumatic oils, are example of this. Russia leather, which is dressed with the empyreumatic oil of the birch, not only does not become mouldy, but also preserves the books which are bound with it. The process of decomposition is greatly hastened by the agency of fungi, such as those which cause mouldiness, and the more formidable destroyers which occasion the dry-rot. The fungi which cause mouldiness are generally prevented from developing themselves by the presence of some aromatic oil ; and the others which occasion the dry-rot in timber, may be prevented from developing themselves by the process invented by Mr. Kyan. This consists in combining the albumen of the wood with bi-chloride of mercury (corrosive sublimate), which it converts into the proto-chloride, in the same way that animal albumen combines with, and converts into the proto-chloride, the same compound (see ALBUMEN) ; the wood is thus rendered insusceptible of the attacks of the fungi. Fungi often attack and destroy the cereal grains, particularly wheat : the worst of these, viz., the *uredo fastida*, (pepper-brand,) may be prevented from farther developing itself by steeping the seeds for twelve hours in lime-water. (See Paper by Mr. Bauer, in *Penny Magazine*, No. 64.)

Insects are frequent agents of nature in forwarding the processes of decomposition. Some penetrate growing trees, and either injure them by opening a passage to air and moisture, or by depositing their eggs, the larvæ from which feed upon the juices and organs of the trees. Such is the destructive power of some insects in this latter way, that some years ago a million and a half of pine trees, in the Hartz mountains, perished from the ravages of the *bostrichus typographus*, 80,000 larvæ of which were found in one tree. About fourteen years ago, the elm-trees in St. James's Park, and the environs of London, suffered greatly from a small insect called the *hylesinus destructor*. The only means yet known of stopping these, is the expedient suggested by Mr. M'Leay, of cutting down the trees and burning them, when the eggs have been deposited, before they turn to larvæ or winged insects.

The collections of entomologists and botanists suffer much from the depredations of insects. Those which infest collections of insects may be driven away by placing camphor in the cases, or by introducing a solution of bi-chloride of mercury into the blood-vessels of larger animals previous to stuffing them. Dried plants, for botanical specimens, may be preserved from the attacks of the *ptinus fur*, by applying to them, when perfectly dry, a solution of bi-chloride of mercury, of the strength of two drachms to a pint of rectified spirit of wine, to which a little camphor has been added. It must be applied to the whole specimen by means of a camel-hair pencil.

The last question proposed to be answered, was how to render the process of putrefaction of bodies useful, instead of pernicious. The obvious answer to this is, to bury them under the surface of the earth. Animal bodies should be buried sooner than most vegetable substances ; but cruciferous plants, such as cabbages, when exposed to the air, are as pernicious as any, and should be buried ; some years ago a severe fever originated at Cambridge, owing to a quantity of cabbages having been thrown over a garden-wall. Such matters should always be buried as manure. 'In this case the food of plants is prepared where it can be used ; and that which would offend the senses, and injure the

health, if exposed, is converted by gradual processes into forms of beauty and usefulness ; the fetid gas is rendered a constituent of the aroma of the flower, and what might be poison, becomes nourishment to men and animals.' (See *Darby's Lectures on Agricultural Chemistry*.)

ANTISPASMODICS, from *anti*, against, and *σπασμός*, spasm, the means of removing spasm. The state called spasm, or cramp, occurs only in muscular structures, and consists in an irregular, and often excessive, action of particular fibres of a muscle, of an entire muscle, or of several muscles. The muscles of an animal of the higher degrees of organization, such as man, are divided into two classes, the one set comprising those which are concerned in carrying on the functions most essential to life, viz. the circulation, respiration, and digestion, which act independently of the will, and are therefore called *involuntary muscles* ; the other, which are organs of motion, and subject, in a certain degree, to the control of the will, are termed *voluntary muscles*. Each set act in consequence of the application to them of some stimulus ; and their action is only uniform or natural when their appropriate stimuli are applied. The heart, for example, contracts from the stimulus of the blood ; and the intestines are so constructed as to have proper motions excited in them by the food which we take, and the secretions which are mixed with it : which actions, in the healthy state, go on, not only without our willing it, but also without our consciousness. The stimulus to the other set is either a sensation felt in the part and communicated to the chief nervous centres, viz. the spinal chord or brain, or a spontaneous effort of volition proceeding from the brain, and originating in some thought, and connected with some purpose or design, to be executed by the muscles thrown into action. Of the motion of such muscles we are always more or less conscious, and when the system is in its perfect or usual state of health, we can repeat their action for a considerable length of time, and regulate its degree by repeated and distinct efforts of the will : as when a man walks, and quickens or slackens his pace according to his inclination. But a variety of circumstances influence the action both of voluntary and involuntary muscles, and render it irregular : when influenced by any of these, the action of the involuntary muscles becomes sensible and painful, and the voluntary muscles cease to be under the control of the will, and act not only without its stimulus, but often against its consent. These disordered actions would appear to be owing to some improper stimulus, instead of the appropriate one, being applied to the organ or part affected. Venous blood, circulating in the arteries, is productive of great disturbance ; and if much of it be conveyed to the brain, it will act as a poison to that organ, for which arterial blood is the natural stimulus as well as source of nourishment. In like manner there are bodies which, though perfectly mild, such as alimentary substances of difficult digestion, yet excite more violent commotions of the stomach than other substances which are of a very acrimonious nature. Undigested food, or unhealthy secretions, in the intestines, excite more disturbance and spasmodic contractions (i.e. cholice, in different degrees of severity) than foreign substances, which we might expect to prove very hurtful ; such, for instance, as the poison of the viper, which is perfectly innocent when received into the stomach.

Both voluntary and involuntary muscles, and the organs of secretion, are very much influenced by emotions of the mind. Under the influence of hope or joy the heart beats vigorously, while under the depressing passions its action is slow and laborious, and accompanied with such oppression as to have given origin to the phrase, 'a heavy heart.' Fear excites to irregular contraction and relaxation many of the voluntary muscles, whence comes trembling ; and produces relaxation of certain muscles, called sphincters, which are usually contracted ; it also augments several of the secretions. Grief, when not excessive, increases the secretion of the lachrymal gland, producing a flow of tears ; if extreme, it hinders secretion, and forms the state truly characterized by our great poet :

'A misery too deep for tears.'

Anger often causes the bile to be secreted in greater quantity, to be altered in its quality, and often absorbed into the blood, thus producing jaundice. The state of mind which may be termed *variation* often lessens the secretion of bile, but augments that of the kidneys ; and every attack of hysteria terminates in a profuse flow of limpid urine, which is destitute of the usual admixture of bile.

These mental emotions, either directly, or indirectly through the altered and unhealthy secretions, occasion in many persons spasmodic contractions of some muscular organs, which are so violent as to produce alarming and often fatal diseases. Of this, ANGINA PECTORIS furnishes an example; and so powerful are the effects of excessive joy in some instances, that the heart *bursting* is not a mere figure of speech, and of grief in other instances, that the heart *breaking* is not a metaphor, but a reality. Many spasmodic actions, such as the cough of whooping-cough, are kept up by habit; others, such as the strange gesticulations of St. Vitus's Dance, are acquired from imitation, as stuttering or stammering is occasionally; and both may become a habit, difficult, if not impossible, to lay aside.

What is termed sympathy is even more powerful than imitation, which implies a voluntary adoption of the peculiarities of others: scarcely any persons in a company can avoid yawning if one sets the example. Now, yawning is an involuntary spasm of the muscles of the jaw, which is thus propagated through a large assemblage of persons; so hysterical and even epileptic spasms are communicated from one to another, often to a frightful extent, if an individual subject to these complaints suffer an attack in theatres, churches, or private apartments. Such an occurrence is sometimes merely the result of affectation, but more frequently it is the consequence of an irresistible impulse. No one was ever seized with tetanus from witnessing the spasms of a person affected with that excruciating disease; a circumstance which can only be accounted for by observing that in it the mind is in no degree implicated, the mental faculties remaining clear and undisturbed to its termination: and there is reason to believe that in this complaint some inflammation or peculiar state of irritation exists about the origin of the nerves, which no one can induce at will, and which neither primarily nor secondarily happens in the others, which are more strictly nervous affections, *i. e.* merely disorders of the functions of nerves without alteration of structure. The development of tetanus is slow, often not showing any sign of its intended attack till some days after the cause of it began to operate on the system. The others are mostly instantaneous, unexpected, and rapid in all their stages. The impression they make on the by-standers is increased by the surprise felt at their unlooked-for occurrence, often without any obvious or sufficient cause. The more sensitive of those around are therefore most apt to fall into a similar state or train of actions. Of the persons so affected, the greater number will be found to be females. What causes render them more subject than others to such attacks? Females, from the larger size of their nerves, are more *mobile*, as it is technically expressed, *i. e.* more easily operated upon by slight causes than others, and their habits of life and education have often a great tendency to increase this sensibility. Whatever diminishes the strength, whether of mind or body, markedly predisposes to such complaints. The female children of the higher and middle ranks, feeble by birth, are rendered more so by the improper modes of education, physical as well as mental, to which they are subjected. After emancipation from the nursery and school-room, their minds and bodies are further enervated by an injudicious course of reading, and an early devotion to the prevailing habits and usages of fashionable life. Such pursuits preclude the possibility of applying themselves to solid studies, or the acquisition of any knowledge of the human system, and of the necessity of maintaining a regular action of every organ and performance of every function.

By a neglect of one of the most important of the natural functions, *viz.* regular and complete evacuation of the bowels, the tone of the intestines is lessened. Now, when the muscular fibres of any particular part are under a state of more or less tension than the rest of the system, this is communicated by sympathy to every other part of the body. This is particularly observable in the blood-vessels and intestines, both of which are muscular tubes; for a relaxation in any part of these will produce a like affection in every other part of the system. And as irritability and sensibility are very much affected by the degree of tension, a want of it in the vessels constitutes what is called a *nervous habit*, such as is most commonly met with in the female sex, and weak, effeminate members of the other sex: such persons will generally be found to be of a coactive habit. The peculiarities of the female system have a large share in increasing the disposition to be powerfully acted upon, at times, by trifling

causes. Exhausting discharges, to which they are very subject, greatly augment the irritability; and all diseases of a very weakening nature will produce a similar effect in the individuals of either sex: during convalescence from these, a disposition to irregular distribution of the blood exists, and a slight excess sent to one part, or a deficient supply of it to another, will cause disorder of the functions of that part. If it be any portion of the nervous structure which is subjected to these errors, spasmodic action is almost surely the consequence. Nothing is more clear or open to proof, than that convulsive motions result from two opposite conditions of the circulatory system, as relates to the quantity of blood, or rapidity of its flow. An animal while bleeding to death suffers violent convulsions, and an excess of blood sent to the head, or its stagnation in the vessels, will produce the same effect; which, indeed, often follows mechanical pressure of the brain, from a portion of depressed bone of the skull, or from effusion of the serum of the blood, in inflammation of the membranes of the brain. The fulness and distension of the vessels of the brain which precedes apoplexy often occasion vomiting, which is a convulsive action of the stomach and some other muscles, and is a warning sign, often unhappily neglected, of the approach of this disease. The more extensive and violent convulsions of epilepsy are, in all probability, the result of a temporarily deranged state of the circulation within the brain, as the loss of consciousness at the time of the attack, the progressive impairment of the intellectual powers, and the usual termination of the disease in apoplexy, palsy, fatuity, and death, attest.

The nature of the causes of the different diseases of which spasm forms, in general, a feature, the complication of these with other diseases or morbid states, and the manner in which each terminates, should all be taken into consideration, if we hope to make a beneficial selection of a remedial agent from among the number of antispasmodic medicines. But such a judicious preliminary measure is rarely adopted; and these articles are often administered in a manner truly empirical, by many professional as well as all unprofessional persons. A brief review of the diseases in which antispasmodic medicines are employed, and which agree only in having spasm for one of their symptoms, while they often differ widely in their causes, nature, and termination, will convince every one how needful is a knowledge of these points to guide us in the choice of the means of cure. The following is not given as a perfect classification or even as an approximation to one, but is merely intended to show the diversified nature of spasmodic diseases, and to furnish an argument for caution in the management of them. The treatment must vary greatly, according as the particular disease is attended with inflammation or not, or according as there is a risk of its occurring, either in the natural progress of the disease, or in consequence of the employment of improper means of treatment. The selection of remedies must be determined also according to the stage of the complaint, and according to the mode in which it is connected with the state of the mental faculties, or its tendency to involve these in the train of morbid actions, if it be not cured before such a calamitous termination take place. Keeping these points in mind, we may arrange spasmodic diseases, in some degree, as follows.

Unattended with inflammation, primarily, or disturbance of the mental faculties:

Simple Cramp. Cholice.—These generally proceed from some undigested substance, or hardened faeces, irritating the bowels: but in the latter disease inflammation is apt to come on; and in the worst forms of cholice, called Ileus, or Iliac-passion, and painter's cholice, it seldom fails to supervene, and then becomes the chief source of danger, as well as most important object of the treatment.

Diarrhoea, or simple looseness, and Cholera.—In these the cramps or spasms are never the first signs, but seem to result from the exhaustion occasioned by the profuse liquid discharges. Inflammation may occur during, or from, diarrhoea, and fever is the most common consequence of cholera, *i. e.* of epidemic cholera; the occurrence of which in either case must lead to a modification or alteration of the plan of treatment.

Angina Pectoris. Asthma.—Affecting the organs of respiration and circulation.

Attended with inflammation, primarily, but causing no disturbance of the mental faculties:

Dysentery.—Affecting the organs of digestion.

Croup, Hooping-cough.—Affecting the organs of respiration.

Unattended with inflammation to an appreciable degree, perhaps in no degree :

Hysteria.—Not affecting the mental faculties, except the volition.

Chorea. St. Vitus's Dance.—Unattended with loss of consciousness; and—

Epilepsy.—Attended with loss of consciousness.

These two diseases sooner or later affect the mental faculties, and have a tendency to a common termination, viz., fatuity, unless they subside spontaneously, or are cured by medical treatment. Chorea generally originates from, or is connected with, accumulations of the bowels, and epilepsy frequently from a similar irritation of these parts, such as worms, but its causes are numerous, and its cure, in most cases, difficult.

Spasmodic diseases, of an obscure nature, chiefly affecting the organs of respiration.

Tetanus and Lock-jaw. Hydrophobia.—These may at some period become attended with inflammation, or rather fever; but this appears to be the result of the constant suffering, and is seldom the direct cause of death, which seems to be the consequence of that depression of the heart's action which long-continued pain or unpleasant sensations produce.

Diseases in which inflammation is the primary affection, spasm the secondary.

Inflammation of the Brain—acute, *Phrenitis*.

Acute or chronic, *Hydrocephalus*, i. e. *Water in the Brain*, occurring mostly in children of a scrofulous habit.

Fever.

The treatment of these diseases is as diversified as their causes; and, to be successful, requires a degree of judgment and knowledge which few possess. To comprehend the nature of those spasmodic diseases which are unaccompanied by inflammation, and for which antispasmodic medicines are chiefly employed, we must be made aware that, in the human system, there are two distinct sets of nerves, having different origins, and fulfilling separate functions; the one set are called nerves of sensation, the other nerves of motion. The former receive impressions, and convey the sensations from all parts of the body to the brain; the latter execute the dictates of the brain by conveying an impulse from it to the organs of motion. The organs of motion—i. e. the muscles—are so adjusted, and in the healthy state so equally supplied with nervous energy, as precisely to balance or antagonize each other (see *ANTAGONIST MUSCLE*): and one muscle, or set of muscles, can only overbalance another, or several muscles, when it receives an additional supply of nervous energy, from an effort of volition. Thus the hand is opened and shut at will: when opened, the extensor muscles overpower the flexor muscles; when shut, the flexor muscles overpower the extensors.

In diseased conditions of the nervous system, this fine balance is lost from various causes: the nerves of sensation may become preternaturally sensitive; the nerves of motion may become paralysed; the power of voluntary motion may be perverted in various ways and degrees; the flexor muscles, independent of volition, may overpower the extensors, or the extensors the flexors. When affected with tetanic spasm, the extensor muscles of the back of a delicate girl could not be replaced in the natural state of equilibrium by any effort of the will, nor by a weight of eight hundred pounds: and under the influence of hysterical or epileptic excitement, a delicate person cannot be controlled by three or four robust men. The action of the muscles is so violent, that the fibres are sometimes torn across, or even the bones fractured.

Some of these spasmodic diseases give, at times, an intimation of their approach, generally by a peculiar sensation being experienced in some part of the body—often the thumb in epilepsy, or between the stomach and throat in hysteria; the spasmodic actions not commencing till these sensations have reached the brain. At other times no warning sensation is felt; yet often, on careful examination, some tender spot will be discovered, of which the patient was not in the least degree previously aware. In hysteria this tenderness is generally felt at some point along the course of the spine or back-bone: and in no case of spasmodic disease should we ever omit a minute examination of this part. Should drawing the finger along the course of the spine, and making firm pressure as we proceed, not reveal its existence, a

sponge, dipped in water as hot as can be borne, will, in its progress along the spine, cause the patient to start when it reaches the tender spot. The discovery of this will often furnish a key to all the strange symptoms and spasmodic actions, as well as explain the capricious conduct, of the sufferer, which has alarmed the friends, and puzzled the medical attendant. When appropriate treatment is directed to this point, most of the troublesome symptoms abate, or cease altogether.

As most spasmodic diseases, especially if connected with affections of the mind, have a great tendency to recur and become habitual, it is of the utmost importance to stop them at an early period.

The remedies which have been found most efficacious in stopping or preventing these, are either such as make strong and new impressions on the organs of sense, and thereby diminish the effect of sensations already existing, or such as blunt the sensibility in general, and thereby diminish all effects of sensation; or else such as raise the whole of the system to a level with the part spasmodically excited, and so establish the equilibrium, from which forced state all muscles may simultaneously subside.

The fibres of each muscle act generally in concert: if a few act independently of the others, these are in a state of cramp. Particular sets of muscles act in concert, as all the flexors, or all the extensors: one or more of these acting independently of the rest cause spasm. Now we often relieve this by calling the others into action; and as volition simply is not equal to this, we use mechanical or medicinal means. Cramp of the limbs is often removed by pressing the toes or fingers against a resisting body, by which all the muscular fibres are brought to the same level. This example of a mechanical process is the only one worthy of mentioning, and is only applicable in slight cases, as cramp of the limbs is generally merely a symptom of some internal derangement of the bowels, of the spinal chord, or of the brain.

The medicinal means constitute the antispasmodic remedies, and are of different kinds. Very few articles are, strictly speaking, merely antispasmodics, i. e., used solely to allay spasm, and incapable of being employed for any other purpose. On the contrary, this is only a particular application of substances capable of serving other, and more general, ends. Consequently, many of the so-called antispasmodics belong to other classes of medicines, such as the stimulants, particularly diffusible stimulants, as alcohol, (brandy,) sulphuric ether, camphor, &c., or to the narcotics, such as opium, belladonna, &c.; or to the tonics, such as metallic salts, viz., of iron, zinc, and silver; or vegetable bitters, as cinchona bark. The first set or stimulating antispasmodics act, apparently, by rousing the nervous energy of the system, and raising the neighbouring muscles to a level with the part in a state of spasmodic excitement. The second set act by rendering the nervous system torpid, and insensible to every sensation; in large doses producing complete insensibility, even to the extent of coma and death. These two are administered when an attack is threatened or actually begun; the tonics are administered while the patient is free from an attack, and act by strengthening the system, so as to render it less susceptible of being acted upon by slight causes, particularly the irritating cause, known, or supposed, to excite the paroxysm or fit. The substances which are more especially considered as antispasmodic are *volatile oils*, such as mint, lavender, &c., derived chiefly from the tribe of the *labiatæ*; or *cajeput oil*, from *myrtacæ*; or dill, anise, fennel, &c., from the *umbelliferæ*, from which tribe also are derived the *fœtid gums*, as they are improperly termed, being gum-resins, such as *assa-fœtida*, *gambanum*, &c. These, with *valerian* and *myrrha* from the vegetable kingdom, and *musk* and *castor* from the animal kingdom, are the most valuable antispasmodics. All the volatile oils seem to act in the same way as the purely stimulating antispasmodics; while the *fœtid gum-resins* act by substituting new and powerful sensations instead of the morbid ones, and must be administered generally when the attack is threatened or begun.

These kinds of antispasmodics differ in value, not only as relates to their mode of action, but to their safety. The stimulating antispasmodics are only admissible when a fit is threatened, or may have begun; and as they greatly excite the vascular system, i. e., quicken the circulation, if upon their being given once they fail to remove the spasm, they should not be repeated. This caution is more espe-

cially necessary in respect to brandy, which is too commonly resorted to on every threatening or attack of spasm, such as cholera. So many of these diseases being connected with, or disposed to end in, inflammation, the free use of brandy, or other stimulant, is decidedly injurious. The inflammation in croup, whooping-cough, and dysentery must first be removed by appropriate means, when the spasm will generally subside or disappear entirely: if it should remain, in whooping-cough, in a great measure from mere habit, antispasmodics may be used, but even then the narcotic antispasmodics, such as Prussic acid, paregoric, or henbane, are to be preferred. The propriety of employing belladonna extensively in this disease is very questionable. (See Gollis on *Hydrocephalus*, translated by Dr. Gooch.) The external employment, in the form of embrocations, of the stimulating antispasmodics, is more allowable in cholera or whooping-cough; but here they act on a different principle, viz., that of counter-irritation. This is, in itself, a most valuable means of curing spasmodic diseases. An irritating application to the spine is of much service in whooping-cough: tartrate of antimony ointment or plaster (see ANTIMONY) applied to the tender spot, which we have said often exists in hysteria, and other similar diseases, will be productive of more good than all the antispasmodic medicines which can be tried. (See Teale on *Neuralgic Diseases*.) Stammering, or other difficulties of speech, might be materially diminished by repeated irritating applications, as blisters, tartrate of antimony ointment, &c., to the nape and sides of the neck. Severe hiccups, continuing for several days, and which resisted all internal remedies, has yielded to a blister applied along the side of the neck. Every physiologist will understand how this happens.

The means which may be employed to intercept the passage of the peculiar sensation to the brain are merely mechanical; for example, tying a string tightly round the thumb prevents the *aura epileptica*, in epilepsy, reaching the brain, and wards off the attack. A cupping glass would answer as well if applied to any large spot whence the sensation arose.

Free scarification of the gums in children, when teething is much more efficacious in allaying convulsive affections than internal medicines, except mild purgatives.

The medicines which may be administered while the patient is free from a fit, or in the intervals of the paroxysms, are much more likely to effect a cure than the others. These are tonics and purgatives. For the reasons already stated, purgatives are of primary importance, as they unload the bowels, improve the secretions, and impart vigour to the whole muscular system. Many cases of severe spasmodic disease have been cured by the use of purgatives only, and none can be cured without their free and daily use for some time. (See Hamilton on *Purgative Medicines*, sixth edition.) Aloetic purgatives are, in general, the best; but where, as in epilepsy, there is reason to suspect the existence of worms, oil of turpentine is to be preferred.

After purgatives have been administered for some time, should the disease not have yielded, metallic or vegetable tonics may be employed with great advantage, particularly in hysteria, chorea, epilepsy, and stammering. In hysteria, chorea, and stammering, the preparations of iron are in general best; in epilepsy, preparations of zinc, of copper, but above all of silver, are preferable: sulphate of quinine is also very serviceable.

For the cure of hydrophobia, or tetanus, nothing has yet been found to succeed. There is some reason to hope that, for tetanus, a powerful vegetable compound from South America, called the *woorali*, may be beneficial, if we may judge by its effects on animals affected with tetanic spasm. (See cases by Mr. Sewell, in *Morgan's Lecture on Tetanus*, Appendix, London, 1833.)

Several of the diseases of which we here speak being connected with mental emotions, and some of them originating from imitation or being kept up by habit, mental agency has sometimes been employed to effect a cure, and occasionally with success.

Upon a threatened attack of hysteria or epilepsy, powerfully attracting the mind to a different object than that which occupies the attention of the patient may ward off the fit. But this requires great judgment and discretion. Formerly the most disgusting means were resorted to, and the sufferers were made to swallow animals of a forbidding kind, or other equally repulsive measures were tried. These cannot be

too much reprobated; and we should bear in mind that chorea, or epilepsy, may be brought on by a sudden fright. The separation of a person subject to chorea, or hysterical and epileptic fits, from among others, is often necessary; and when we know that the spasmodic actions are the effects of imitation, the employment of fear may be justifiable; but in any other case it would be criminal to have recourse to it, and thereby, perhaps, add a mental disorder to a bodily one, already sufficiently afflicting.

Our endeavours to lessen the tendency to nervous diseases will be most successfully directed to regulating the education, physical and moral, of children, especially of female children. This subject has been already treated of under the article AGE, to which we refer, as well as to Number XXIII. of the *Foreign Quarterly Review*, Art. v. 'Hypochondriasis and Hysteria'; also to the excellent chapters on Spinal Irritation, Choreia, Hydrocephalus, and Convulsions, in Burns' *Principles of Midwifery*.

ANTISTHENES, the pupil of Socrates, the master of Diogenes, and commonly reputed the founder of the Cynic school. The time of his birth, as well as that of his death, is uncertain; but he was the contemporary of Socrates, Plato, Aristotle, Xenophon, &c., and may be said in general terms to have flourished about 380 B. C. Diodorus Siculus mentions him as still alive in the third year of the 103rd Olympiad, corresponding to B. C. 366. (See Clinton's *Fasti Hellenici*, p. 107.) According to Diogenes Laertius, who has given a life of him in his sixth book, he was born at Athens, of which his father, named also Antisthenes, was a citizen. His mother was a native of Thrace, or, as Plutarch says, of Phrygia. He first attended the school of the Rhetorician Gorgias; but, leaving him after some time, he became a follower, and eventually one of the most distinguished disciples, of Socrates. He afterwards established a school of his own, in a place at short distance from the city, called Cynosarges. Whatever may be the origin of the word Cynosarges, it is not impossible that this term may, as some writers assert, have given birth to the appellation Cynics, by which the followers of Antisthenes came to be known. We prefer, however, the more obvious derivation which deduces the epithet directly from *κυν*, a dog, and regards it as simply expressive of the popular notion respecting the character of the sect of philosophers so designated. The opinions of the Cynics will be discussed under that word. We may here merely remark, that it is certainly a mistake to rank them as ascetics. The antipathies and invectives of Antisthenes, and especially of his more celebrated follower Diogenes, appear to have been fiercely directed against the elegancies and ornamental superfluities of life; but by no means against such gratifications of the senses as could be obtained without much trouble or expense. The vice of these pleasures, according to their notion, lay not in the indulgence, but in the cost. Anything more thoroughly opposed than all this both to the spirit of general civilization and to the elevation of individual character, it would not be easy to conceive; but the system is very susceptible for all that of a plausible outside representation. It was a not unnatural perversion of the penetrating, sagacious, and sarcastic philosophy of Socrates, by a person of the moral and intellectual construction of Antisthenes. He seems to have been endowed with strong natural powers, but is said to have held all learning and mental cultivation in contempt. It may be supposed, therefore, that his views would be more remarkable for their clearness than their extent. He appears, in fact, to have had more wit than wisdom. He was famous for the brilliancy of his conversation; but although his written works, as Diogenes Laertius tells us, extended to ten volumes (or perhaps treatises, *ῥήματα*), they have all perished. From the list of their titles given by the biographer, they appear to have been mostly rhetorical or sophistical declamations; and, like other such compositions, they had probably plenty of point and smartness, but not much sterling value. Indeed, the only judgment as to their merits which Laertius records is that of a critic of the name of Timon, who thought their author an ingenious trifler. Laertius has enumerated many of the sayings of Antisthenes; but, like the witticisms of the ancients in general, most of them have an elaborate and ponderous air to a modern taste. One which has been often quoted is his sarcasm on the foolish choice of their magistrates and other public officers frequently made by his fellow citizens. He advised them one day, with a serious air,

to set to work and make their asses horses: and when they stared at the absurdity of the proposal, and exclaimed that the thing could not be done, he answered, It will be done if you merely command it; do you not in this way every day do what is quite as wonderful, turning incapables and block-heads into generals and admirals? Another, which illustrates his religious opinions, is his answer to the priest of the Orphic mysteries, when he was assured by that personage that all who should be initiated therein would enjoy eternal felicity after death: Why then, said he, do not you die? He was himself probably sceptical on the subject of a future state. When Diogenes came to visit him a short time before his death, as he lay ill in bed, he eagerly expressed his impatience under his sufferings. Here, said his decisive and unceremonious pupil, offering him a knife, this will relieve you in a moment. Ah! answered Antisthenes, it is not my life I want to get rid of, but my pain. Cicero (*De Naturâ Deorum*, i. 13.) has preserved a theological dogma of this philosopher, which has been often quoted to his honour: *Esse populares deos multos, sed naturalem unum*: That the popular gods are many, but the God of nature is one. It has, however, been acutely remarked by Cudworth, (*Intellectual System*, i. 4, 22.) that by the expression, *populares deos*, here, we are to understand, not the gods of popular superstition generally, or the multitudinous deities of the pagan system, but merely the different names given to the same supreme ruler of the universe by different cities and nations. The meaning of Antisthenes is more clearly expressed in the version of Lactantius, *Unum esse naturalem Deum, quoniam gentes et urbes suos habebant populares*: 'There is one God of nature, though nations and cities have their own popular (peculiar) deities.' Cudworth is of opinion that the philosopher had no design to take away all the inferior gods of the pagans, which, had he attempted, he would have been accounted an atheist, but only to point out the great truth which indeed was acknowledged by all superior minds among the ancients (with some exceptions), that there was one God who was supreme over all the rest, and that he was the same whom the Greeks worshipped as Zeus, the Latins as Jupiter, the Egyptians as Hammon, the Babylonians as Bel, the Scythians as Pappirus, &c.; as likewise that the Jupiter of the heavens, and the Neptune of the sea, in the popular mythology, were only so many names for this one deity.

The moral maxims of Antisthenes sound, in general, very lofty. He regarded all actions as being either virtuous or vicious, and virtue as the only thing worthy of desire or esteem. Before giving him credit, however, as the teacher of a pure and elevated system of ethics, on the strength of these imposing generalities, it would be necessary to know exactly what he meant by virtue. Diogenes certainly carried the principles of Cynicism to much greater length than his master. The fullest and perhaps the fairest picture we have of Antisthenes is given by Xenophon, who has introduced this philosopher as one of the speakers in his *Συμπόσιον*, or Banquet, and put into his mouth, among other things, a very striking discourse on the wealth of poverty. Altogether he is here represented in a very engaging light.

A few additional particulars respecting this philosopher may be collected from Laertius and other sources. He is said to have had few pupils, and to have treated them with great harshness. Antisthenes has the credit of having set the example to his followers of wearing his beard long, and carrying the staff and satchel, or wallet, (*πίψα*), which afterwards became the distinguishing badges of the sect. He is also stated to have first worn the cloak doubled, (*διπλασιάζειν τὸν ῥιπίδιον* and *διδυμάσαι θοράκιον* are the expressions of Laertius,) whatever that may have meant. It was a fashion likewise practised by his followers, and appears to have consisted in bringing the right end of the cloak a second time over the left shoulder, so as to leave the whole of the right arm, shoulder, and a part of the breast exposed. When the cloak was worn in this manner, the tunic or lower garment was dispensed with: and in this principally seems to have consisted the economy or convenience which recommended the fashion to the Cynics. (See Octavius Ferrarius, *de Re Vestiaria*, part ii., lib. 4, cap. 19, p. 194, edit. Batav., 1654, quarto.) The peculiar name for the philosophic cloak is *ῥιπίδιον*, or in Latin *tribonium*, which signifies literally, a worn or threadbare garment. Antisthenes professed to dislike the haughtiness of Plato; and on one occasion, when the latter had expressed his admiration of a horse,

distinguished by its noble bearing, 'You, Plato,' said Antisthenes, 'would have made an excellent horse.' The father of the Cynics, however, is affirmed on high authority to have had pride enough too, although it might not have been of so elevated a character as that of the founder of the Academy. One day, we are told, when Antisthenes, being in the company of Socrates, had ostentatiously displayed a ragged part of his garment, by way of showing his philosophical contempt for those things of which other men were vain, 'Ah, Antisthenes,' said Socrates, 'I perceive your pride through the holes of your cloak.' Antisthenes is said by Laertius to have had a principal share in bringing Anytus and Melitus, the accusers of Socrates, to punishment. But it has been doubted whether such punishment ever took place at all. (See Barthelemy, *Voyage du Jeune Anacharsis*, chap. 67, note.) Two short orations, entitled *Ajax* and *Ulysses*, attributed to this philosopher, are printed in the *Oratores Græci* of Henry Stephen and of Reiske; and also in Dobson's *Collection*, vol. iv. They are two puerile rhetorical declamations, and, if written by Antisthenes, which we may reasonably doubt, do him no credit.

ANTISTROPHE. [See STROPHE.]

ANTITACTES. [See HERETICS.]

ANTI-TAURUS. [See TAURUS.]

ANTITHESIS, a Greek word (*ἀντίθεσις*) literally signifying 'opposition.' It is used in various senses by the Greek writers: sometimes it means merely 'objections,' or 'opposite arguments': sometimes it is used to denote the contrasting of one set of circumstances with another: as, for instance, when an orator or other person attempting to place the conduct of an adversary in the worst light, first states what the accused *ought* to have done, and then what he *has* done.

But the term antithesis is most commonly used to express contrast of ideas: and the term is equally applied whether the contrast is effected by single words, or by single clauses. (See Quintilian, *Inst. Orat.*, lib. ix. cap. iii.) The following example from the oration of Demosthenes against Æschines, entitled the Crown, is, in part, quoted by Demetrius Phalereus (*Treatise Ἐπεὶ Ἐπὶ Ἐπὶ Ἐπὶ*, § 262), and by Hermogenes: it is a sample of antithetical invective, in which Demosthenes attempts to show his superiority over his opponent:—'You were employed in teaching, but I was taught: you were a mere menial in the service of religion, but I participated in the sacred rites: you were one of the chorus, but I was the choragus (director of the chorus): you were a petty clerk, but I was a public speaker: you were an actor and played a third-rate part, but I was a spectator: you failed in your part, and I hissed.' This taste for antithesis shows itself very strongly in the Greek language, both in poets and prose writers, and more especially in some of the orators and rhetoricians: but it is generally and justly condemned by the Greek writers on style. The antithesis does not necessarily imply contrariety between the things which are brought together; for example, one of the rhetorical exercises of Gorgias, entitled the *Eucronium of Helen*, begins with the following antithesis:—'The ornament of a state is the courage of its men: of the body, beauty; of the mind, wisdom; of action, virtue: of words, truth.' Quintilian (ix. 3) expresses the Greek term *ἀντίθεσις* (which is equivalent to *ἀντίθεσις*) by the Latin word *contrapositio*; and he remarks, that the antithesis does not always contain contrarieties or opposites. He gives the following example from the rhetorician Rutilius: 'To us first the immortal gods gave the fruits of the earth: what we alone received, that have we diffused over the whole earth. To us our ancestors transmitted a commonwealth: we have rescued from servitude our allies also.' Cicero has the following example of antithesis, which may be compared with similar examples in our own language:—'Quod scis, nihil prodest: quod nescis, multum obest,' which may be very imperfectly translated—'What you know, does no good; what you do not know, does much harm.' When antithesis is used sparingly and judiciously, it sometimes gives force to expression, and helps to fix distinctions in the memory; but its frequent and indiscriminate use tends to draw the mind from a true perception of the subject, and to fix it on the play of words more than on the real meaning of the sentence.

ANTI-TRINITARIANS. [See ARIANS, SOCINIANS, UNITARIANS.]

ANTIUM, now called Porto d'Anzo, a sea-port on the coast of Latium, or the Campagna of Rome, once a city of

the Volsci, and noted in Roman history as the place of refuge of Coriolanus. Antium, after having been often the enemy and at times the ally of Rome, was finally taken by the Romans in the year B.C. 337, and became a Roman colony. On this occasion, the *rostra*, or metal beaks with which the prows of the galleys of Antium were armed, being taken as a trophy to Rome, were placed in the forum, as an ornament to the hustings from which the orators pleaded before the magistrates and the assembled people, and which, in consequence, took the name of *rostra*. Horace mentions the Temple of Fortune which rose on the bold promontory within shelter of which the present Anzio is situated. Nero, who was born at Antium, excavated a port and adorned it with fine buildings. He also built here a palace for his wife Poppæa. Remains of ancient masonry are yet to be seen on the point of the cape, and partly in the water. The port having been filled in after-times, Pope Innocent XII. built a mole which serves to shelter vessels of light burthen. There is also a small fort, and a prison for the convicts who are sent here from Rome to be kept at hard labour. The native population of Porto d'Anzo does not exceed 300 inhabitants, and it is altogether a miserable place. The malaria prevails all about the country around in summer, but is not quite so fatal within the place itself, on account of its situation projecting into the sea. From October to June the air is wholesome, and the climate remarkably mild and pleasant. This, together with the beauty of the coast and the fine sea view which extends on one side to the Circean Cape and the island of Ponza, and on the other to the mouths of the Tiber, induced several Roman noblemen about a century since to build palaces and villas near the shore, which now appear neglected and deserted by their descendants. Anzo exports a great quantity of charcoal made from the wood of the neighbouring forests. It is also frequently resorted to by coasting vessels, it being the only place of shelter in bad weather between Gaeta and Civita Vecchia. About two miles S.E. of Anzo is the town of Nettuno, on the sea coast, with a population of 1200 inhabitants, chiefly sailors and fishermen. The women of Nettuno still retain their old Greek costume. The malaria does not seem to affect the people who live within the walls of Nettuno. Porto d'Anzo is thirty miles S. by E. of Rome; the Alban hills are seen rising to the north about fifteen miles inland. The plain between is divided into enormous farms, one of which, that of Campomorto near Porto d'Anzo, measuring above 17,000 acres, has been visited of late years by various travellers, whose attention had been attracted to its peculiar economy by Chateaubriand in his *Letters from Italy*.

ANTIVARI, a town in Albania, in European Turkey, on the coast of the Adriatic. It is a little to the N.W. of the mouth of the river Boiana, which forms the outlet of the lake of Skodré (Scutari); and has a good harbour. It was peopled during the middle ages by Italian colonists, and is still the see of a Catholic archbishop. It was taken from the Venetians in 1573; and the inhabitants are now chiefly Mohammedans. They amount to about 4000, and are for the most part seamen, being among the few Albanians who venture on that element; they enter into the naval service of the Barbary states.

Antivari forms the port of Skodré, (from which it is distant about 20 miles,) and is the depôt of the valley of the Drin, the chief manufacture of which is shoe leather. It is defended by a fortress: 42° 4' N. lat., 19° 9' E. long. (Hobhouse, Balbi.)

ANTLIA PNEUMATICA, the air-pump, a constellation in the southern hemisphere, named by Lacaille. It is bounded by Centaurus, Crater, Hydra, Pixis Nautica, and Argo. The magnitudes and numbering of its principal stars are as follows:

Mag.	Letter.	Plazzi.	Ast. Soc. Cat.
6		39	1226
4.5	<i>a</i>	82	1243
5.6		90	1249
6	<i>δ</i>	91	1251
6		123	1262
6	<i>0</i>	166	1176
5		199	1299

ANTŒCI, from the Greek, signifies those who live over against each other, and is applied to designate the inhabitants of two places which have the same longitudes and latitudes, only differing in one latitude being north and the other south. For example, Malta and the Cape of

Good Hope are nearly Antœci. Two antœcial places have the same hour of day or night, but opposite seasons of the year.

ANTOINE DE BOURBON, Duke of Vendome, married, in 1548, Jeanne d'Albret, only child of Henry II., king of Navarre. Henry Prince of Béarn, afterwards Henry IV. of France, was the offspring of this marriage. Antoine assumed the title of king of Navarre in right of his wife. The Bourbons were collaterals of the Valois dynasty, being descended from Robert Count of Clermont, a younger son of Louis IX. As such, Antoine de Bourbon aspired to be at the head of the administration of France after the accession of the youthful king Francis II., but being himself of an indolent, wavering disposition, he was supplanted by the more enterprising and ambitious Guises, uncles to the young Queen Mary Stuart. After the death of Francis II., in 1560, the king of Navarre was named Lieutenant General of the kingdom, and adviser to the queen mother (Catherine de Medicis), during Charles IX.'s minority. When the civil and religious war broke out in 1562, the king of Navarre commanded the king's troops, and received a wound at the siege of Rouen, of which he died in November of the same year. [See BOURBON, and HENRY IV.]

ANTOINETTE, (MARIE,) queen of France. [See MARIE.]

ANTONIA MAJOR, the elder daughter of Antonius the triumvir, by Octavia, the half-sister of Augustus, born 39 B.C. She married L. Domitius the son of Cn. Domitius, who supported the interests of Antony in the disputes with Augustus, until a short period before the battle of Actium, and the grandson of L. Domitius, who fell in the flight from Pharsalia. Among the descendants of Antonia were some of the most illustrious personages in Rome. One of her daughters, Domitia Lepida, was the mother of Messalina, afterwards married to the Emperor Claudius; and her son Cn. Domitius, marrying Agrippina, became the father of the Emperor Nero. We have called this Antonia the *elder* in agreement with Suetonius and Plutarch. Tacitus, on the contrary, speaks of her as the younger daughter. (Ann. IV. 44. XII. 64.)

ANTONIA MINOR, the sister of the preceding, born B.C. 38 or 37. She married Drusus Nero, the brother of the Emperor Tiberius, by whom she became the mother, 1. of the celebrated Germanicus; 2. of Livia or Livilla, who was first married to Caius Cæsar, the grandson of Augustus, and after his death to her cousin Drusus, the son of Tiberius; and 3. of the Emperor Claudius. Caligula, being the son of Germanicus, was her grandson.

Antonia was not fortunate in her domestic relations: she lost her husband B.C. 9, before she was thirty years of age, by a fall from his horse. Early in the reign of Tiberius (A.D. 19), she saw the widowed Agrippina return from the east with the ashes of her son Germanicus. In 23, her daughter Livia, corrupted by Sejanus, assisted in the murder of her own husband Drusus, but her guilt remained unknown to the world until eight years after, when Antonia herself became indirectly the cause of the discovery. Sejanus was then preparing to execute his final schemes for the destruction of Tiberius, when his intrigues became known to Antonia, who communicated her information through the freedman Pallas to the emperor. The ruin of the favourite brought many past crimes to light, among others the murder of Drusus; and Livia met the fate which she deserved, her own mother, if we may believe one of the accounts given by Dio, opposing herself to the pardon offered by the emperor. Under the reign of her grandson Caligula, she was at first highly honoured, receiving every distinction which had formerly been conferred on the celebrated Livia. But respect soon changed to coldness and ill-treatment; and at last her death was supposed to be hastened by his neglect, if indeed it was not brought about

by more direct means. If we place her death in the first year of Caligula, she was about seventy-five years of age. The Emperor Claudius had experienced from her when a child little of maternal affection, but he honoured her memory when he came to the throne in every way that the flattery of the age permitted. Pliny speaks of a temple dedicated to her. Of the private life of Antonia little is known. She was celebrated for her beauty, and still more for her chastity, in an age too when that virtue was not common; and Pliny has recorded the singular fact, that during her whole life she was never known to spit, which he accounts for from the more solid nature of her bones, and the want of marrow. The beautiful head of Antonia is taken from a gold medal in the British Museum, which is exactly one-half the diameter of our drawing, and in most complete preservation.

ANTONIN (SAINT), a small town in France, in the department of Tarn and Garonne, on the right, or north bank of the river Aveyron, which unites with the Tarn. The inhabitants, who are given in the *Dict. Géographique de la France* (1801) at 5606, and by Balbi (1833) at 5000, manufacture serge and leather. It is about 24 miles N. E. of Montauban, the capital of the department: 14 10' N. lat., 1 46' E. long. (*Dict. Géog. de la France*: M. Brun.)

ANTONINE COLUMN, a lofty pillar which stands in the middle of one of the principal squares of the city of Rome. It was raised by the senate in honour of the emperor Marcus Aurelius Antoninus, and in memory of his victory over the Marcomanni and other German tribes. It was one of the principal ornaments of the Forum of Antonine. An inscription which has been found near it, and which is now in the Vatican, it is styled 'Columna centenaria Divi Marci.' It was also called 'the greater Antonine column,' to distinguish it from another and a smaller one, made of a solid piece of granite, which had been raised in honour of Antoninus Pius. (Nardini and Nibbi, *Roma Antica*, and Vignola, *De Columna Antonini Pii*.) During the ages of barbarism which followed the extinction of the western empire, this pillar, and especially its pedestal, suffered greatly from the hands of the various invaders, as well as from the fires which frequently occurred at Rome; the historian Poggio says also from lightning. Pope Sixtus V. repaired it at the expense of 10,000 scudi, and placed the inscription which is now seen on the pedestal, the original one having been probably defaced. He also raised on the summit of the pillar a bronze statue of St. Paul: that of Marcus Aurelius, which formerly stood there, had been removed it is not known when or by whom. The shaft of the pillar is 13 feet 1 inch in diameter at the bottom, and one foot less at the top; its height, including the pedestal and capital, is 136 feet, of which 13 are under ground; and the statue on the top and its pedestal are 27½ feet more, making the whole height 163½ feet. (Taylor and Cressy's *Architectural Antiquities of Rome*.) The pedestal of the Antonine column is disproportionate to the shaft. The capital is Doric. The shaft is made of twenty-eight blocks of white marble placed one above the other, a spiral staircase of 190 steps is cut through the interior of the marble, and leads to the gallery on the top, which is surrounded by a balustrade. The exterior of the shaft is covered with bassi-relievi placed in a spiral line around, which represent the victories of Marcus Aurelius over the Marcomanni and other hostile nations. One of the most remarkable facts recorded in these historical sculptures is that of the unexpected and abundant shower which came opportunely to quench the thirst of the Roman soldiers, while fighting under their emperor in a remote part of Germany, and suffering from heat, fatigue, and the repeated attacks of the surrounding barbarians, A. D. 174. The style and execution of these sculptures are inferior to those of the Trajan pillar, which the artists evidently purposed to imitate. The sculptures of the Antonine column have been engraved by Santo Bartoli, and illustrated by Bellori. The pillar itself is still one of the most striking monuments of ancient Rome and one of the principal ornaments of the modern city. It has given to the square in which it stands the name of Piazza Colonna. The palace Ghigi forms one side of the square, and the street del Corso forms another. A handsome fountain by Giacomo della Porta also adorns the square.

ANTONINUS PIUS, or, with his full name, according to Capitolinus, Titus Aurelius Fulvus Boionius Antoninus Pius, was the son of Aurelius Fulvus and Arria Fadilla. He

was born September 19, A.D. 86, in the reign of Domitian, at Lanuvium now *Lavinia*, a town of Latium, a few miles south of the Alban Lake. His ancestors, on his father's side, were of Nemausus, now Nîmes, in Languedoc. His youthful years were spent at Lorium, (a town on the north side

the Tiber, not far from its mouth,) under the care of his paternal and maternal grandfathers, T. Aurelius Fulvus, who had twice been consul, and Arrius Antoninus, who also had twice attained the same honour. It seems probable, from his character in after life, that he had been brought up with great care, and probably in the principles of the Stoical philosophy, which, as emperor at least, he certainly encouraged.

[Gold, Brit. Mus. diam. doubled.]

Through his extensive family connexions he inherited great wealth, and was speedily raised to the successive dignities of questor, praetor, and consul. His taste, however, was for a country life. When Hadrian entrusted the administration of Italy to four men of consular rank, he gave to Antoninus the government of that part in which his possessions lay. During his consulship and his subsequent government of the province of Asia as proconsul, there were, as his credulous biographer informs us, many strange presages of his future elevation. On his return to Rome, he was often consulted by Hadrian on public matters; and finally he was adopted as the emperor's successor, on condition of adopting himself, Marcus Antoninus, the son of his wife's brother, and Lucius Verus, the son of Ailius Verus, who had been adopted by Hadrian, but had died prematurely. He then became associated with the emperor in the government of the Roman world. On Hadrian's death, A.D. 138, he became emperor with the title of Antoninus Augustus, to which the name of Pius is added on his medals. As to the origin of the name Pius, his biographer gives various conjectures (see Capitolinus, chap. ii.): the title of Pater Patriae, 'father of his country,' was subsequently conferred (chap. vi.), and recorded on his medals after the titles of Augustus and Pius. It is unfortunate that the only history of this emperor's life, his *Biography* by Julius Capitolinus, is altogether deficient in that precision and chronological arrangement which would enable us to form a just judgment of the public events of his reign. He seems never to have left Italy after his elevation, but his officers maintained the security of the provinces and protected the frontiers from aggression. In Britain, Lollius Urbicus confirmed the former conquests (see ANTONINUS, VAL- LUM); the Moors of Africa were compelled to sue for peace; and the attempts at rebellion in Germany, Greece, Judaea, and Egypt, were checked by the vigour of his governors. One of the most curious events in the foreign affairs of the reign of Antoninus is his helping the Olbiopolitae, or inhabitants of Olbia, a Greek colony on the Borysthene, against a nation called the Tauro-Scythae, probably a Nomadic race of the Dnieper and the Don. The Tauro-Scythae were compelled by the Roman emperor to give hostages to the people of Olbia. The emperor died at Lorium in the seventy-fifth year of his age, (seventieth, according to Capitolinus,) A.C. 161, and was succeeded by Marcus Aurelius, commonly called Antoninus the philosopher. Antoninus was buried in the tomb of Hadrian, one of the architectural monuments with which he adorned Rome.

Antoninus married Annia Faustina, the daughter of Annus Verus, by whom he had four children, one of whom, Faustina, became the wife of M. Aurelius. The conduct of Antoninus's wife gave occasion to scandal, but the good-natured emperor had philosophy enough to endure what he could not prevent. On her death, in the third year of the emperor's reign, the senate paid her the usual compliment of divine honours: a temple, with statues of gold and silver, was decreed by the senate.

accepted by the husband, to the memory of a wife not altogether faultless. A temple erected to Antoninus and Faustina still exists in part in the Campo Vaccino at Rome. Antoninus even created an establishment for young females, who were called *Faustinianæ*, in honour of the deceased empress. This institution is commemorated in medals that still exist with the inscription *Puellæ Faustiniæ*—the Virgins of Faustina. The general character of the policy of Antoninus was beneficent and just, and the Roman world perhaps never had a more indulgent and amiable master. He continued the governors of provinces for many years in office when their conduct was satisfactory: and the provinces themselves enjoyed under his reign freedom from all exorbitant taxation. He surrounded himself with a council of chosen friends, without whose advice he took no public measure of any kind. Their counsels directed him in drawing up the imperial decrees (*formæ*), which were to have the force of law. Judges who discharged their duty faithfully were never removed. In his elevated station the emperor maintained the simple character of his early life, mingling in the society of his friends like one of the same rank, and using his unlimited power more like a private citizen entrusted with it by his fellow-countrymen than as the undisputed master of the empire. The practice of giving pensions or allowances had grown up under preceding emperors, and had become a part of the imperial system of patronage. Antoninus continued it, and gave, as Capitolinus informs us, salaries and honorary distinctions to the professors of rhetoric and philosophy in all the provinces. Apollonius the Stoic was specially invited from Chalcis to superintend the education of M. Aurelius. But the idle and worthless who had obtained public allowances felt the effect of the prudent emperor's reforms, who remarked, 'that nothing was more disgraceful, nothing more cruel, than for a man to feed on the public property who had done nothing to improve it.' The people and the soldiery participated in the bounty which the policy or generosity of the emperor distributed: he relieved distress in time of scarcity, and for their amusement filled the amphitheatre with animals from all countries. The elephant, the hyæna, and the antelope, with the crocodile, the unwieldy hippopotamus, and the tiger, were exhibited for the gratification of the people. On one occasion a hundred lions at once were let loose into the amphitheatre.

Under the reign of Antoninus, the lawyers, Umidius Verus, Salvius Valens, Volusius Metianus, Ulpus Marcellus, and Diabolenus, were employed by the emperor in improving the laws. One of the emperor's regulations of sanitary police is worth recording: he forbade the burying of dead bodies in cities. With respect to his regulations about physicians, see the article *ARCHIATER*. His policy towards the Christians was mild, but the authenticity of a rescript which would show him to have been completely tolerant, appears not to be proved. (Neander, *Allgemeine Geschichte der Christlichen Religion*, &c., i. 151.)

[Gold, Brit. Mus. diam. doubled.]

Of casualties in his reign, which Capitolinus, like a good chronicler, does not omit, we find enumerated a famine, the fall of a circus at Rome, an earthquake in Rhodes and the province of Asia, and a fire at Rome which destroyed three hundred and forty houses. Narbonne, Antioch, and Carthage also suffered from fire. The emperor's bounty was on such occasions always actively employed in relieving human suffering. He embellished the imperial city with various edifices, and extended his liberality also to remote cities of the empire. Antoninus was tall, and of a handsome person, as his biographer tells us, and his medals still show. His habits were abstemious and regular. He was honoured with the name of *Divus* (God) at his death, and

all the tokens of respect paid to the best emperors. According to the fashion of the times, a special priest, public games, a temple, and a college of priests, as was usual on such occasions, were designed to perpetuate the memory of one of the most amiable princes whom history has recorded. Whether he owes too much to the favourable history of Capitolinus, and the general absence of other evidence, we cannot decide. (See the *Life of Antoninus* by J. Capitolinus; and Schlosser, *Universalhistorische Uebersicht*, vol. iii. pt. i.)

ANTONINUS, THE ITINERARY OF, one of the most valuable works, in a geographical point of view, which has descended to us from the antients. It is merely what its name imports, an itinerary, but it extends over the whole Roman empire in its widest sense, embracing all the main roads in Italy and the provinces, in each of which the different stations are named with the intervening distances. There is also attached to the above a brief maritime itinerary of the distances from port to port. This work, with the Peutingerian Table and the Jerusalem Itinerary, is of great use in constructing the maps of the Roman and Grecian world. In a work of such value it has been an object of some interest to determine the date of its publication and the name of its author; for the name of Antoninus, under which it now passes, has been retained perhaps more from the convenience of having some conventional author to refer it to, than from any good reason for believing that such was really the author's name. In the different MSS. of the work it is variously ascribed to Julius Cæsar, Antonius Augustus, Antonius Augustalis, and Antoninus Augustus. On a consideration of all the arguments adduced by Wesseling in the preface to his excellent edition of the work, there seems to us reason for thinking that some share in the authorship may be ascribed to the three distinguished names, Julius Cæsar, M. Antonius, and Augustus, though such is not the opinion, it should be stated, of Wesseling himself. The main, though not the only argument of Wesseling, seems to be that, had such a work existed in the age of Pliny, it must have been mentioned by him. Negative reasoning of this kind is not of great weight, especially in relation to a writer so incorrect as Pliny. That itineraries of some sort must have existed in the time of Pliny can scarcely admit of doubt. Even in the history of Herodotus we find Aristagoras, the tyrant of Miletus, possessed of a map of the whole world on copper, 'containing every sea and every river'; and this historian himself has given a rough kind of itinerary of the road from Ephesus to Susa, apparently from personal knowledge of the route. Alexander in his march to India was provided with a corps of officers called *Bematistæ* (*Itinerrarii*), whose especial duty it was to measure the roads and record the different distances. As early as the time of Polybius, the Romans had laid down mile-stones from the Rhone to the Pyrenees; and Strabo says that the great Egnatian road from Apollonia on the Adriatic to the Hebrus was similarly marked by a column at every eight stadia, or Roman mile. Agrippa, among other ornaments of the Roman capital, designed a noble geographical monument in a representation of the whole world on a portico, a design which was completed by Octavia and her imperial brother in the Octavian portico. Even the provincial city of Augustodunum (Autun) had porticoes of the same kind, where maps of every part of the known world with all the names were exhibited to the youth of Gallia. Now if any period were to be selected at which it was probable that the grand work of measuring all the roads in the empire would be undertaken, it would be the moment when the victories of Cæsar in Greece, Egypt, Asia, Africa, and Spain, had at last consolidated the Roman conquests; and he who conferred on his country the great blessing of a well constituted calendar, would naturally direct his mind to the scarcely less important object of a general survey of the empire. But we are not left to conjecture. Æthicus (a geographical writer of uncertain date, but not later than the fourth century, if it be true that St. Jerome translated his *Cosmographia* from Greek into Latin) states in as many words that Julius Cæsar, the author of the bissextile year, ordered a general survey of the empire under a decree of the senate. This was undertaken in three parts, he tells us, the east by Zenodotus, the north by Theodotus, the south by Polykleitus; they began their labours in B.C. 44, the year in which Julius Cæsar and M. Antonius were consuls, and finished them respectively in B.C. 30, 24, and 19, when Augustus, now sole

master of the Roman world, gave the sanction of the legislature to the results by a second decree of the senate. This passage of Æthicus, which certainly bears on the face of it no evidence of forgery or fraud, will well account for the various names prefixed, as above stated, to the MSS. of the *Itinerary*, and it is not impossible that Æthicus himself may have been the editor of the work in the form in which it has come down to us. The *Itinerary* has been found forming part of the same MS. with his *Cosmographia*, and indeed even the authorship of the work has been assigned to Æthicus by more than one writer of the middle ages.

That the *Itinerary*, supposing it to be founded originally upon the above-mentioned public documents, afterwards received many additions and modifications, cannot and need not be disputed. The roads of Britain could not have been all added until the time of Severus, whose *vallum*, or great wall of protection against the Picts, (erected A.D. 209,) is more than once mentioned. The name Diocletianopolis (p. 330) carries us to a period between 285 and 305, and the expression '*Porsulis quæ modo Maximianopolis*,' (p. 321, see also p. 331,) '*Porsulis*, which has been recently changed to Maximianopolis,' leads to the same date. The insertion of the name *Constantinopoli* after that of *Byzantio* affords but weak ground for any argument, as the words *quæ et Constantinopoli*, (p. 139,) and *quæ Constantinopolis* (p. 323) are not found in the Vatican MS. So again the words *a Constantinopoli usque Antiochia* (p. 140) are omitted in the same MS. and condemned by Wesseling himself. These three omissions cannot be accidental. And besides these, there is not a trace of any name marking a period later than the reign of Diocletian, for the station *Candidiana* (p. 223) has no connexion with the son of Galerius, but may rather be compared, as to its termination, with similar forms in pp. 55, 88, 89, 94, &c. On the other hand Cirta, the great city of Numidia, is not called Constantina; Antaradus on the Phœnician coast is not called Constantia. Nor is there any the slightest allusion to the Christian religion which might well have been made in speaking of Antioch: while, on the contrary, we find the names of Juno, (p. 524,) Minerva, (p. 525,) Venus, (p. 526,) Apollo, Diana, and Latona (pp. 527, 529).

As a specimen of the work, we quote a few lines which may be interesting to the reader of Horace's amusing journey to Brundisium. In this extract it will be seen that little regard is paid to the grammatical cases; but this is not an evidence of a very late age, for even before the time of Constantine it had become not uncommon to consider the names of places as indeclinable, and the case selected to serve for all was generally the accusative or ablative. The numbers within brackets mark a variation in the MSS., some of which admit of easy explanation, but the occurrence of these errors in the number of miles is the chief drawback from the value of the work. The road commences from Rome.

ANTONINUS, WALL OF. This was an entrenchment raised by the Romans across the north of Britain under the direction of Lollius Urbicus, legate of Antoninus Pius, about the year A.D. 140, and is supposed to have connected a line of forts erected by Agricola, A.D. 80. Of ancient writers, it is noticed by Julius Capitolinus only, and by him is termed a turf wall (*muris cespitiis*). The work

was composed of a ditch, a rampart with its parapet, made of materials promiscuously taken from the ditch, and a military way formed with much skill, running along the whole line of the entrenchment at the distance of a few yards on the south side. It extended from Dunglass Castle on the Clyde to the heights above Caer Ridden Kirk, a little beyond the river Avon on the Frith of Forth, or probably to Blackness Castle two miles farther on, though it cannot now be traced so far. In its course are nineteen forts, the eighteen distances between which amount to 63,980 yards, or 36 English miles, and the mean distance from station to station is 3554 yards, or rather more than two English miles. In the position of the forts, the Romans chose a high and commanding situation from whence the country could be discovered to a considerable distance, contriving, as far as circumstances would permit, that a river, morass, or some difficult ground should form an obstruction to any approach from the front. Forts were also placed upon the passages of those rivers which crossed the general chain of communication. From inscriptions discovered in Scotland, it appears that the entrenchment was made by the second legion, by vexillations of the sixth and the twentieth legion, and the first cohort of the Tungri. A very considerable portion of the entrenchment may still be traced. The modern name is Grimes Dyke; Grime, in the Celtic language, signifies great or powerful. (See General Roy's *Military Antiquities of Britain*; and Horsley's *Britannia*.)

ANTONINUS LIBERALIS, probably lived under the Antonines. He is the author of a work in Greek entitled *A Collection of Metamorphoses* (*Μεταμορφώσεων συλλογή*): this collection is borrowed from a variety of authors, and is curious for containing many passages of poets who are now lost. The best edition is said to be that of H. Verheyk, Leiden, 1774. 8vo. See Bast's *Epistola Critica*.

ANTONIO, MARC. [See RAIMONDI.]

ANTONIO, one of the claimants to the throne of Portugal after the death of King Sebastian, was the natural son of the Infante Don Luiz, son of King Manuel. Antonio accompanied his cousin, King Sebastian, in his unfortunate expedition to Africa, and was there taken captive in 1578. He had the ability to conceal his real name and rank, and consequently had less difficulty in obtaining his deliverance.

On his return to Lisbon he found his uncle, Cardinal Enrique, who had been appointed regent by Sebastian, in possession of the throne. Antonio immediately claimed the crown on the plea that his father had secretly married his mother. Enrique ordered him to produce the proofs, which were found to be forgeries. By the advice of the pope's nuncio, Antonio excepted against the judgment of the king, and appealed to the Archbishop of Lisbon, reserving the final decision to the pope. The cardinal-king declared Antonio a traitor, degraded him from his rank, and exiled him from Portugal. Antonio fled to Spain, where, however, he did not remain long. He there solicited an interview with the Spanish minister, and offered to give up his claim to the king of Spain, Philip II., for an annual pension of 300,000 ducats and the regency of Portugal during his life. This extravagant proposal was naturally rejected. In the mean time the cardinal-king assembled the cortes of the realm at Lisbon, in April, 1579, to decide the question of the succession. He also appointed a council of eleven judges to examine the rights of the respective claimants, and named a regency to govern the kingdom in case his death should take place before the cortes had come to a final decision. All the candidates bound themselves upon oath to abide by the resolution of the cortes, but before they had pronounced their judgment, the king died, on the 1st of January, 1580.

The cortes was at this time at Almerin. Antonio, who had already returned from Spain, hastened immediately to Lisbon, where he summoned the authorities to receive him as king. Not succeeding here he repaired to Santarem, where the deputies of the third estate had removed from Almerin; and he flattered their vanity by telling them, that the power of appointing the successor rested in them alone. He then invited the inhabitants of the towns in the vicinity of Santarem to repair thither, and proposed to them to recognize him as governor of the kingdom. One of his own servants put a rag on the point of his sword, and hoisted it, crying, *Real, real por Dom Antonio*; the word was caught by the multitude, and he was proclaimed king.

Antonio now proceeded to Lisbon. The regents fled at

his approach, and he was proclaimed king in the capital also. The regency went to Setubal, where they found that the people had declared in favour of Antonio. The new government proclaimed the regents as rebels, and a detachment of cavalry was sent in pursuit of them. But the Duke of Alba at the head of the Castilian army, in the mean time, invaded the kingdom to take possession of it in the name of Philip, and reduced Elvas, Villaviciosa, Estremoz, Montemor, and other places. Alcazar do Sal also opened its gates to the Spaniards, and Setubal afterwards followed its example. The Marquis of Santa Cruz with the Spanish fleet had also taken possession of other places on the coast. Antonio, at the head of 12,000 men, courageously opposed the invaders, but he was defeated, and the duke entered Lisbon by capitulation. Antonio retreated to Coimbra, and on the inhabitants refusing to admit him, he went to Aveiro, plundered the town, and proceeded to Oporto, where he knew he had some adherents. The success of the Castilian arms, however, had so changed the dispositions of the inhabitants, that they had offered to surrender the town to Philip, and openly refused to admit Antonio. But some of his partisans having opened one of the gates, he entered the town like an enemy, and his soldiers committed the most violent excesses. The Spaniards soon arrived before Oporto. Antonio had only 3000 men, chiefly recruits, who fled before the Spanish veterans, and both conquerors and conquered entered Oporto together. In this hurry and confusion, Antonio escaped to Viana do Minho, where he embarked; but the sea was so rough that he was forced back to land. He was now placed in a very perilous situation. A large body of cavalry was in pursuit of him, and the sum of 80,000 ducats was offered for him dead or alive. In this situation he disguised himself in a sailor's dress, and by mixing only with the lower orders, he was able to remain for some months in Portugal, going from one town to another, until at last he escaped to France.

At Paris, he published a manifesto in Latin, French, and Dutch, and sent it to Holland and England, from which quarters he expected some assistance. This document bears the date of 1585. In 1588 he came to England, soon after the destruction of the Spanish Armada. He was favourably received by Queen Elizabeth, and though she at first refused him any effectual assistance in invading Portugal, she was at last persuaded to equip a fleet in which she sent the exile back to his country. If we are to believe the Portuguese and Spanish historians of the period, the proposals of Antonio were most monstrous. They say that he offered, among other things, to receive English garrisons into all the principal places of Portugal, and to maintain them at his own expense; to abandon the city of Lisbon to twelve days' pillage, and even to bestow the principal offices in the kingdom on Englishmen. In 1589, the expedition, consisting of 120 vessels with about 20,000 volunteers, sailed from Plymouth under the command of Sir Francis Drake and Sir John Norris. After having attempted in vain to take Coruña or Corunna, they anchored at Peniche, about twelve miles from Lisbon. The troops were safely landed, and part of them marched under their commander Norris towards Lisbon, while the admiral went up the river with the remainder. The land forces in their march found that the people, instead of joining them, as Antonio had promised, fled at their approach. They advanced, however, as far as the capital, without opposition, and assailed the outworks; but the garrison making a vigorous sortie, the English general commanded his men to retreat; some of them were cut off, and he saved himself, with the remainder, in the fortress of Cascaes. Here, both from want of provisions, and from feeling that they had been disappointed by Antonio, whose cause they now considered desperate, the English determined to return home. Antonio retired to France, where he ended his days in obscurity and indigence, on the 26th of August, 1595, deserted by his friends, and neglected by all the sovereigns who formerly had espoused his cause. (See Lemos, *Historia General de Portugal*, vol. xvii.; Antonio de Herrera, *Historia de Portugal*; Mariana, from the year 1578 to 1590.)

ANTONIO (NICOLAS or NICOLAO), a Spanish writer, born at Seville, in 1617. He received his early education at the Dominican school of that city, where he also studied divinity two years. In 1636 he went to the university of Salamanca, where he studied civil and canon law under the celebrated jurist Ramos del Manzano. In 1639 he was made a bachelor of arts. He returned afterwards

to Seville, and devoted his time entirely to collect materials for his *Bibliotheca*. In 1646 he was created a knight of Santiago, and in 1659 Philip IV. appointed him general agent for the court of Spain at Rome, which office he held with honour until he was recalled by Charles II. He was then made a canon of Seville, and created a counsellor of Castile. He resided afterwards for some time at Seville; subsequently, he went to Madrid, where he died of epilepsy on the 13th of April, 1684. He has left behind him the following works:

1. *De Exilio, sive de Exilii poena antiqua et nova, Erulunque conditione et juribus. Libri tres; cum indice* Antwerp, 1641 and 1659.—*Of Banishment, or of the Punishment of Exile, Antient and Modern, and on the Condition and Rights of the Exiled*: Antwerp. Antonio was twenty-three years of age when he wrote this work.

2. *Bibliotheca Hispana*, the best and most complete edition of which bears the following title: *Bibliotheca Hispana, vetus et nova, sive Hispanorum Scriptorum, qui ab Octaviano Augusti ævo ad Annum Christi MDCLXXXIV. floruerunt, Notitia. Curante Francisco Perezio Bayerio. Matriti, Joachimus Ibarra. 1788. 4 vols. folio. Bibliotheca Hispana, Antient and Modern, or an Account of the Spanish Writers who have flourished since the age of Octavianus Augustus to the year 1684.*

3. *Censura de Historias Fabulosas. A Criticism on Fabulous Histories.*

The principal work of Antonio is his *Bibliotheca*. Baillet says that he prefers it to all the works of the kind in existence, not excepting that of L'Alegambe. 'The criticism of the author,' adds he, 'is correct, his Latin pure, his style elevated, though now and then it is obscure on account of his long parenthetical phrases.' This judgment is, in our opinion, correct, and, for Spanish literature, there is certainly neither a better nor a safer guide.

Antonio was a man of a liberal and charitable disposition: notwithstanding the lucrative offices he had held, he died so poor that he did not leave his heirs sufficient property to enable them to print part of the works which he left unpublished. Cardinal Aguirre, the author's friend, defrayed the expenses of the work. (See the author's own book; the *Biogr. Univ.* and Bayle's *Dictionary*.)

ANTONIO, ST., the most northerly of the CAPE VERDE islands.

ANTONIUS, MARCUS, the orator, was born 142 B.C.; in 99 he was the colleague of C. Postumius Albinus in the consulship; and in the following year he defended M. Aquilius on a charge of extortion during the servile war in Sicily. In 97 he was censor, and he fell a victim to the fury of Marius and Cinna, when they took forcible possession of Rome in 87. His eloquence is celebrated by Cicero in his *Brutus*, chap. 37, 38. Two of his sons appear prominently in the history of Rome.

ANTONIUS, MARCUS, son of the orator, and father of the Triumvir. When the short-lived power of Mithridates over the Grecian islands had been put an end to by the successes of Sulla and his lieutenants, in the absence of a controlling fleet a general system of piracy arose in the Grecian seas and the adjoining coasts. This evil proceeded to such a degree, that in the year 75 B.C., through the influence of the Consul Cotta, Antonius was intrusted with the extraordinary province of protecting all the coasts of the Mediterranean. Crete was the chief scene of his operations, and though his successes for a time gained him the honorary title of Creticus, the outrages and extortion of which he was guilty, led at last to an insurrection in which he lost his life, about B.C. 69; and the credit of reducing the island was reserved for Metellus.

ANTONIUS, CAIUS, surnamed Hybrida, another son of the orator, was the colleague of Cicero in his consulship (B.C. 63). It became his duty, under the orders of the senate, to conduct the war against Catiline; but on the day of the battle he was prevented, or pretended to be prevented, by illness from appearing on the field, and the command devolved upon his lieutenant, Petreius. On the termination of the war, he proceeded (B.C. 61) as proconsul to the lucrative province of Macedonia, which had originally fallen to Cicero's lot, but had been transferred by him to Antonius, from a patriotic desire to attach him to the cause of his country. Such, at least, is the assertion of Cicero. Antonius, on the contrary, gave out that it was a matter of mere bargain and sale, and that Cicero had stipulated for the payment in return of a large sum of money, a charge which Cicero's ambiguous

language and conduct on the occasion seem not to discomfite. To raise this money, Antonius was guilty of great extortion, and his conduct gave such general dissatisfaction, that at the end of the first year Pompey threatened a motion in the senate for his recall. Cicero, who avows in his private letters that he could not defend Antonius without injury to his own character, nevertheless exerted his eloquence most powerfully and successfully in his defence. Accordingly, Antonius held the province for a second year; but on his return (B.C. 59) he was formally brought to trial by Cælius on a charge of extortion, and of carrying on war out of his province without the authority of the state. Though again defended by Cicero, he was found guilty, and condemned to perpetual exile. The trial took place on the very day that Clodius was adopted into a plebeian family, and thus enabled to direct his attacks successfully against Cicero.

ANTONIUS, MARCUS, the Triumvir, was the son of M. Antonius, surnamed Creticus, and Julia, a member of the patrician house of the Cæsars, sister of L. Julius Cæsar, the consul of 61 B.C. The year of his birth is somewhat uncertain, being assigned by different authors to 56, 53, and 51 B.C. His father dying while he was yet young, he received the greater part of his education under the direction of his mother Julia, who was at that time married to Cornelius Lentulus.

[Gold, Brit. Mus. diam. doubled.]

In his very outset into life Antony had the misfortune to form an acquaintance with young Curio, and the two friends entered upon such a course of extravagant dissipation that Antony was soon deeply involved; but Curio, being surety for the debt, prevailed upon his father, by the intercession of Cicero, to discharge it. Among the Roman nobles who were put to death by Cicero as accomplices of Catiline, one of the most distinguished was Antony's step-father, Cornelius Lentulus, then prætor of Rome. He

was probably guilty; but the consul and the senatorian party had still more certainly violated the laws in putting citizens to death without trial. It was natural, then, that Antony should attach himself to Clodius, when that powerful tribune (whose character, it may be observed, should not be taken from his unscrupulous enemy) was employed in bringing Cicero to punishment. But Antony did not approve of the violence to which Clodius resorted. Accordingly, he went over to Greece, where he diligently applied himself to the two pursuits most important to a Roman, oratory and military science. From thence he was invited to join Gabinius, who, as proconsul of Syria, was engaged in protecting his province from the ravages of Aristobulus and his son Alexander (B.C. 57, 56). Antony in this war commanded the cavalry, and evinced great spirit and military talent. In the course of the following year, Gabinius undertook to restore Ptolemy Auletes to the throne of Egypt, and again the credit of his success was chiefly due to Antony, who secured the only road from Syria into Egypt, and made himself master of Pelusium. Here he showed a goodness of disposition, for which history has rarely given him credit, by sparing the inhabitants from the furious revenge of Ptolemy.

Gabinius returned to Rome in the autumn of 54, but Antony, who had now established his reputation as an officer, as soon as hostilities ceased in Egypt, hastened at once to Gallia, the theatre of a still more important war. In the year 52 we find Antony acting as one of Cæsar's lieutenants in the siege of Alesia. He now became a candidate for the quaestorship, and even aspired to the place in the college of augurs, then made vacant by the death of Crassus. His pretensions to the latter office he withdrew in favour of Cicero, who, at the intercession of Cæsar, was reconciled to Antony, and promoted his election to the quaestorship,

while he in return opposed the turbulent conduct of Clodius. No sooner was Antony's election completed than he hastened back to Gallia, where, at the close of the year, he was left by Cæsar at the capital of the Ædui in the command of the troops there quartered. The following year he was employed under Cæsar in extinguishing the last embers of the Gallic war; and so fully had he gained the support of the general, that through his interest and that of Curio he was elected early in 50 B.C. into the college of augurs.

The senatorian party meanwhile had withdrawn Pompey from his friendship with Cæsar, but the tribunitial power was still a check upon their arbitrary proceedings, and through the influence of the same powerful friends Antony was raised to that dignity. The tribunes entered upon their office on the 10th of December, whereas the consular authority commenced upon the first day of the year. Antony employed this interval in advocating the just rights of Cæsar with the people. When the kalends came, however, the senatorian party put to the vote the fatal motion that Cæsar should disband all his troops by a given day, or be treated as a public enemy. Antony and his colleague Cassius interposed their tribunitial *veto* , but the senate was now prepared to break down all the popular barriers of the constitution; the two tribunes were allowed but six days to consider their *veto* , and on the 7th of January the decree was passed which at once suspended all the laws of the state, and gave to the senatorian party despotic and irresponsible power over all the citizens. The tribunes, thus at the mercy of tyranny, fled in disguise to Cæsar, whose army in a few weeks drove the authors of the late revolution from Italy. On the first expedition of Cæsar into Spain, Antony was left in the military command of Italy, which was again intrusted to him in the winter of the same year, when Cæsar crossed into Epirus. In the performance of this duty he distinguished himself by his able defence of Brundisium and its port against a Pompeian fleet under Libo, and soon after he crossed the Adriatic with reinforcements for Cæsar. In this campaign he on many occasions rendered the most efficient service, particularly at the battle of Pharsalia, where he commanded the left wing. In the following year, Cæsar, being appointed dictator, selected Antony as his master of the horse, an appointment which again gave him the chief authority in the absence of the dictator. During this period he showed his firmness in checking the violent proceedings of Dolabella. Plutarch, indeed, attributes his conduct to a mere feeling of revenge, in consequence of a supposed intrigue between Dolabella and his wife Antonia, for he had married his own cousin, the daughter of C. Antonius Hybrida. He accordingly divorced Antonia, and gave way to the most open licentiousness, about which Cicero's second *Philippic* abounds with scandalous anecdotes, exaggerated however most probably by the malice of the orator. One of the most outrageous acts, recorded by Pliny, was his appearance in public with an actress named Cytheris in a car drawn by lions. When Pompey's property was confiscated, Antony had purchased his house and grounds in the street called Carinae at Rome, under the idea, says Cicero, that the money would never be demanded, and when Cæsar insisted on the payment, he was obliged to sell a large portion of his property, including a patrimonial estate at Misenum, to raise the required sum. To the fact that Antony occupied Pompey's house, there are frequent allusions in Cicero's speeches and the anecdotes of Plutarch. Antony soon broke off his connexion with the Grecian actress, which had been the cause of so much scandal, and married Fulvia, the widow of Clodius. During the second war in Spain (45 B.C.) against the sons of Pompey, when Cicero was induced by some exaggerated accounts of their successes to meditate an escape from Italy, he was checked by the interference of Antony, whose letter on the occasion still exists. The next year Antony was the colleague of Cæsar in the consulship, but the senatorian party again dreamed of recovering their power, and the idle affair of the Lupercalia was seized as a pretext for the conspiracy against Cæsar. At one time there was a desire on the part of the conspirators to admit Antony into their body, but this was prevented by Trebonius, on the ground that he had himself made some advances to Antony the very preceding year on his subject, which had been decidedly rejected. This fact is one proof of the little foundation which Cicero thought necessary for the grossest charges. He has not scrupled to accuse Antony of joining Trebonius in a conspiracy to murder Cæsar, when we have the authority of Trebonius

himself, as reported by Plutarch, for the opposite statement. As Antony was not likely to join in the crime, it was next proposed to make him also a victim, but this was prevented by M. Brutus; and it was finally determined to engage him in conversation outside of the senate-house while the assassination of Cæsar was committed within.

Antony, a man of spirit, but of prudence, saw that it was necessary to act guardedly with men who accomplished their ends by assassination. He amused them, therefore, for a time with the most conciliatory conduct, knowing, perhaps, that the people would soon recover from their first alarm and rise against the murderers of their benefactor, more particularly the veterans who now feared to lose again the rewards of all their past labours. We omit to enumerate a number of acts on the part of Antony, such as his receipt of Cæsar's treasures from Calpurnia, his speech over the body of Cæsar, his publication of decrees, real or pretended, as in the name of Cæsar, because a much greater effect was attributed to these acts than they could of themselves have produced. The real power of Antony lay in the detestation in which the senatorian oligarchy was held. The self-styled patriots were soon afraid to appear in Rome, and Antony, supported by his two brothers, Caius and Lucius, who happened at this time to hold the offices of prætor and tribune respectively, had a prospect of establishing himself in a station scarcely inferior to that from which Cæsar had been thrown down. But he found his most powerful opponent in young Octavius (afterwards Augustus), the great nephew and adopted son of the late dictator, who, with a duplicity beyond his years, managed to unite the support of the most opposite parties, the oligarchy and the veterans. Utterly unscrupulous about his means, he made an attempt, at least Cicero gives his authority to the report, to remove Antony by assassination. After numerous intrigues on all sides, Antony left Rome in October to meet at Brundisium four of the veteran legions from Greece: but Octavius, or, as he now called himself, Cæsar, found other veterans in the colonies of Campania ready to support one who bore so auspicious a name; and two of the four legions from Greece suddenly passed over to him from Antony. Before the year was closed, hostilities commenced in the north of Italy, where Antony besieged Decimus Brutus in Mutina. On the 11th of April, B.C. 43, the first battle was fought, when Antony, after defeating Pansa, was himself the same evening defeated by Hirtius. A few days after, he was again defeated in a twofold attack from Hirtius and Cæsar on the one side, and D. Brutus on the other, and compelled to cross the Alps.

The senatorian party were already enjoying their triumph, when the scene unexpectedly changed. The two consuls had fallen in the late contest. Decimus Brutus, though relieved from the siege, was without cavalry or commissariat, and unable to pursue; and Cæsar, never sincere in the cause of the senate, and himself supported by the senate only for their own purposes, at last threw off the mask. Ventidius had joined Antony with three legions, and the presence of the latter was sufficient to gain over the troops of Lepidus, then stationed in the south-eastern angle of Gallia, even if Lepidus was earnest in opposition to him. Finally, Plancus on the Isara and Pollio in Spain, after a long hesitation, declared themselves likewise in favour of the more powerful party. Thus Antony, who had fled from Mutina, with a strong body of cavalry indeed, but with not more than a single legion, if we exclude the unarmed, now retraced his steps across the Alps at the head of seventeen legions, the greater part veterans, leaving behind him six others to guard the important province of Gallia. Decimus Brutus, on the other hand, had only ten legions to oppose him, and of these eight were from the recent levies and all of doubtful fidelity. In the mean while, Cæsar had put an end to the equivocal conduct of the senate by marching upon Rome, and extorting the consular fasces.

In the autumn of this year the celebrated triumvirate was established between Antony, Lepidus, and Cæsar, sometimes called the second triumvirate, but without sufficient reason, as the private understanding between the first Cæsar with Pompey and Crassus never assumed a public character. Antony and his colleagues, on the contrary, received their title under a public vote at Rome, and made use of it in all their public acts. In the proscription, which was one of the first acts of the triumvirate, Antony, whose conduct on so many occasions was distinguished for clemency and generosity, must bear his share of the guilt, more par-

ticularly in relation to Lucius Cæsar and Cicero. The former of these, his maternal uncle, was saved indeed by the bold interference of his mother, Julia; but Cicero, who had escaped from Rome when Cæsar appeared there with his army, was overtaken by his pursuers on the coast, and his head and right hand were cut off and fixed on the rostra of the Roman forum. But it is no slight palliation of the crime of proscribing this orator, that he had more than once in his life advocated the principle of assassination, and particularly had expressed, in language of the most brutal ferocity, his regret that Antony had not been murdered with Julius Cæsar. His private letters, as well as his public speeches, contain repeated assertions to that effect in all the various figures which his oratorical skill could supply. But Antony felt soon after the natural consequence of his crime, when his brother Caius, who had been some time a prisoner in the power of Marcus Brutus, was put to death in revenge of the murder of Cicero.

In the division of the provinces between the triumvirs, Antony received the whole of Gallia Citerior and Ulterior, with the exception of Gallia Narbonensis. To him and Cæsar was assigned the conduct of the war against Brutus and Cassius; and in the following year this war was brought to a close by two battles in the neighbourhood of Philippi, in both of which the success was due almost exclusively to Antony. Among the distinguished Romans who fell into his power on this occasion was the son of the orator Hortensius, who had been the instrument of Brutus in putting his brother to death. He ordered the prisoner to be slain upon his brother's tomb,—an act of revenge which, however criminal in itself, the Roman notions of piety perhaps required. Antony remained some time in Greece, particularly at Athens, where he ingratiated himself with the citizens. He then crossed into Asia, and Ephesus became the scene of more than Asiatic luxury. At Tarsus he saw the fascinating Cleopatra, whose influence so fatally affected his fortunes. He had summoned her to answer some accusations brought against her of assisting Cassius in the late war; and the queen, in obedience to the command, appeared in her gorgeous barge upon the Cydnus attired as the goddess Venus. Antony was led captive to Alexandria, where he lost sight of all that was going on in the world around him. He was at last roused from his voluptuous revels by a Parthian invasion on the one side, and a war in Italy on the other. A Parthian army under the guidance of Labienus, a Roman of the senatorian party, who had accidentally been absent from the battle of Philippi, had overrun all the provinces from Syria to Asia. Antony set out to oppose them, but had scarcely arrived in Phœnicia when he was induced by the urgent solicitations of Fulvia to proceed with a fleet of two hundred sail towards Italy to oppose Cæsar. But the war in this quarter was at an end before his arrival: Perusia had fallen. The death of Fulvia, who, with Antony's brother Lucius, had been the chief cause of the war, led to a speedy reconciliation between Antony and Cæsar, which was cemented by the union of Antony with Octavia, the half sister of Cæsar, herself but recently a widow by the death of Marcellus. On this occasion a new division of the empire was made, in which Antony received as his portion all the provinces east of the Adriatic. In the following year, another step was gained towards securing the peace of the empire by a treaty with Sextus Pompeius, whose fleet had given him the command of Sicily and other islands.

Leaving the management of affairs at home to Cæsar, Antony proceeded with Octavia to Greece. Here he heard that his lieutenant Ventidius, to whom he had left the conduct of the Parthian war, had been highly successful, that the invading army had been defeated, and that Labienus had fallen in the battle. In the following year (38) the same able officer gained a still more decisive victory over the Parthian prince Pacorus, who had invaded the Syrian province,—a victory the more gratifying to the Romans because it occurred on the same day of the year as the defeat of Crassus fifteen years before. As these successes had been obtained by a lieutenant under the auspices of Antony, the latter was entitled, by the established principles of Roman warfare, to the honour of the triumph; but Antony, guided by a more generous feeling, sent Ventidius to Rome to enjoy this honour. Another of his lieutenants, Sosius, was scarcely less successful in a Jewish

* It is almost certain that he had previously seen her at Rome, when she was residing at the time of Cæsar's death. Antony met her at Philippi.

war against Antigonos, for which he likewise triumphed a few years after (31 B.C.); and a third, Canidius, had recovered Armenia, and carried the arms of Rome to the foot of the Caucasus. On the other hand, the siege of Samosata, which was partly conducted by the general in person, rather detracted from than added to his military fame by the long and determined defence of the Commagenian prince Antiochus. But Antony was again called to Italy by the suspicious conduct of Cæsar. On his approach to Brundisium he was refused admittance into the harbour, on the ground that he was accompanied by Domitius, who, it was pretended, had been a party in the murder of the dictator. After much angry discussion and some hostile movements, a second reconciliation was effected by the mediation of Octavia, and Julia, the mother of Antony, who at the same time belong to the House of Cæsar. This new arrangement took place at the end of 37, or in the following spring. The most important article was the renewal of the triumviral power for a second period of five years, commencing from the last day of the year 38, the day on which the first period of their triumvirate terminated. Cæsar now conducted the war against Pompey, while Antony directed his arms against the Parthians. On his approach to Syria he sent for Cleopatra, on whom he conferred the provinces of Phœnicia, Cœlesyria, Cyprus, and part of Cilicia, Judæa, and Arabia. His preparations for the invasion of the Parthian empire were on the largest scale, but the influence of the Egyptian queen produced the most disastrous effects. The army commenced their march too late in the season, and after a campaign in which the soldiers showed the greatest spirit, and the general, on some occasions, no little military talent, the retreat was effected with great loss, partly through the eagerness of Antony again to meet Cleopatra.

The failure of this campaign had been in a great measure owing to the treacherous desertion of the king of Armenia. Accordingly, in the following year, Antony was anxiously looking out for an opportunity of revenge, and a quarrel between the king of Media and the Parthians seemed to offer a favourable opportunity. The prospect of a war at any rate afforded him a pretext for avoiding an unwelcome visit from Octavia, whom he directed to remain at Athens, while he added to the insult by still dallying with Cleopatra at Alexandria. The following year, the invasion of Armenia took place, and by treachery, in his turn, Antony got the king into his power. In the mean time, Cæsar, by the overthrow of S. Pompeius and the usurpation of the provinces assigned to Lepidus, was at last prepared for a contest with Antony himself, who afforded him more than a pretext by the neglect of his sister and his conduct at Alexandria, where he seemed wholly to have exchanged the character of a Roman citizen for that of an eastern monarch.* In 33, Antony again commenced an invasion of Parthia, but as soon as he had reached the Araxes, he retraced his steps to prepare for the war that now threatened him from the west. Still a second year was passed in preparations; and in 31, the possession of the Roman world was decided by the victory off Actium. (See ACTIUM.) From that day the fate of Antony was fixed. In August, 30 B.C., Cæsar appeared with a fleet and army before Alexandria, to which Antony had retreated; and the desertion of his fleet and of his cavalry before his eyes left him only the poor hope of sustaining a siege. A false report of the death of Cleopatra completed his despair, and he killed himself with his own sword. Cleopatra likewise saved herself by suicide from adorning the triumph of the conqueror. It was a singular coincidence that the account of Antony's death was laid before the senate by M. Tullius Cicero, the son of the orator, who assumed the consular fasces on the ides of September. Antony's age at his death was a little more than 50; that of Cleopatra 39. He was four times married, or indeed, five times, if we may admit his marriage with Padiæ, on the authority of Cicero. Of his two children by Fulvia, Antyllus the elder was put to death; and the younger, Iulus Antonius, to whom Horace has addressed an ode, after long enjoying the favour of Augustus, suffered for his intimacy with Julia, the emperor's daughter. By Octavia, he had at least two daughters (see ANTONIA); and by Cleopatra, a daughter of the same name, and two sons, Alexander and Ptolemy Philadelphus. Of these, the

daughter married the learned African prince Juba. (See Cicero's *Letters and Orations*; Cæsar: Velleius; the *Extrictes* of Livy; Plutarch's *Life of Antony*, Dion, Appian, &c.; and Clinton's *Fasti*.)

The heads of Antony and Cleopatra are taken from a silver coin in the British Museum, in which the expression of Cleopatra's face fully agrees with the assertion of Plutarch, that her fascinating powers depended not so much on her beauty, in which she was inferior to Octavia, as on the charms of her manner and conversation. Plutarch also mentions the remarkable aquiline nose of Antony.

ANTONIUS MUSA. [See MUSA.]

ANTRIM, a county in Ireland, bordering on the coast at the N.E. extremity of the island, and in the province of Ulster. It is bounded on the N. by the Atlantic, on the E. by the north channel, (which forms the northern entrance into the Irish Sea, and separates Ireland from Scotland,*) on the S.E. by Belfast Lough, on the S. by the county of Down, on the S.W. by Lough Neagh, and on the W. by the county of Londonderry, from which it is separated for the most part by the river Bann.

This county extends from N. to S. 56 miles, and from E. to W. 30½ miles; and contains, according to the trigonometrical survey now making under the direction of the Board of Ordnance, 758,808 acres, of which only 483,048 are arable, 225,970 being mountain and bog, and 49,790 under water. The sea-coast is romantic and picturesque. Near the western extremity of that part of it which belongs to this county, is the 'Giants' Causeway,' an immense pile of perpendicular basaltic columns, varying in their number of sides, but chiefly hexagonal, touching each other on every side without intervals or void spaces, and forming a huge mole or pier which extends far into the sea. (Hamilton's *Letters concerning the Coast of Antrim*.) [See GIANTS' CAUSEWAY.] Other specimens of columnar basalt are found along the coast, as at the promontory of Bengore in the neighbourhood of the Giants' Causeway, and at Fairhead, a headland about eight miles east of the last; also in some places inland. From Fairhead, the coast, which runs so far nearly W. and E., turns to the southward to the entrance of Belfast Lough, and presents to the eye a succession of precipitous cliffs projecting boldly into the ocean, and broken by a few bays and creeks. Off the coast lie the islands of Skerries, and Rathlin or Raghery. The Skerries are small islands W. of the Giants' Causeway. Rathlin is larger, being seven miles in length, and containing about 2000 acres, of which about 500 are arable. It is crescent-shaped, with the horns turned towards the main-land, from which it is separated by the strait of Slunk-na-marra:—the passage of this strait is often dangerous from the heavy swell. The inhabitants, who amount to 1080, are engaged in fishing, raising barley, or manufacturing kelp. At Doon Point, in this island, are some singular basaltic columns, horizontal, perpendicular, and curved. The eastern side of the county is mountainous; but the mountains form irregular groups rather than a continuous chain, and are intermixed with bogs, which also prevail in the western and flatter part of the county. The principal heights are Slennish, about the middle; and Knocklayd or Knocklead, in the northern part of the county. There is a popular opinion that Belfast is subject to much rain; but this opinion is owing rather to the frequency of the showers than to the actual quantity of rain that falls, which in the years 1795-98 was much below that at Londonderry in the adjoining county to the west.

There are no rivers or streams of any importance running through the county. The largest are the Bush, which, rising in the mountainous district to the N.E., near Knocklayd, flows first to the west and then to the north, and falls

* The distance from the Mull of Cantire, in Scotland, to the N.E. point of the county of Antrim, is less than fifteen miles.

* On one of the medals given in this article we see the face of Antony and Cleopatra on opposite sides; the characters on the medal are Greek. As Antony here calls himself one of the triumviri, it was probably struck before the downfall of Lepidus.

into the ocean at Ballintrea near the Giants' Causeway, after a course of about 20 English miles: and the Main, which has a southerly course of nearly 30 English miles from Lough Gule into Lough Neagh near Randal's Town, and receives the waters of several tributaries. The Bann, a far more important stream, which flows through Lough Neagh, forms the boundary of this county towards the west, separating it from the county of Londonderry [see BANN]; and the Lagan, which rises in the county of Down, and has a course of nearly 40 English miles into the Belfast Lough, divides the counties of Antrim and Down.

Antrim is divided into fourteen baronies, Upper and Lower Dunluce and Carey in the north; Upper and Lower Glenarm, stretching along the east coast; westward, Kilcunaw, Upper and Lower Antrim, and Upper and Lower Toome; Upper and Lower Belfast, inclosing the county of the town of Carrickfergus, and Upper and Lower Massarene, occupy the south, and comprehend the most beautiful, improved, and populous parts of the county. These baronies include 71 parishes: one in the bishopric of Dromore, the rest in the bishopric of Connor both which bishoprics are in the ecclesiastical province of Armagh.

The estates, with the exception of land held under the see of Connor, are freehold; either immediate from the crown, or held by lease from the grantees. The fee of the greater part of the county belongs to the Antrim family, and the Marquises of Hertford and Donegal. The other principal proprietors are the Countess Massarene, Lords O'Neil and Templeton, and Colonel Packenham. Agriculture is in a very backward state, the land being very generally occupied in small holdings by the farmers, who are also engaged in linen weaving. In the flat parts of the county, along the shore of the Belfast Lough, the farms rarely exceed ten acres, part of which is devoted to raising potatoes, the quantity thus appropriated being regulated by the quantity of manure, which latterly has been much increased by the use of lime: a small part to raising flax, the ability to purchase seed here guiding the occupier; and the remainder to oats, which crop is repeated two or three years; and when the land is exhausted, it is left to lie fallow, or 'turned to rest,' until, by receiving the manure saved, it is fitted for raising potatoes again; after which come the oats (sometimes wheat) or flax. Barley is frequently sown, but seldom in large quantities. Beans are grown in one or two parishes on the coast, chiefly for export to Scotland. Clover has lately to be an object of attention; but turnips, vetches, &c.

kale are little regarded. The small size of these farms, if such they may be termed, and the rockiness of the soil, lead to the use of spade husbandry; or if the farms are somewhat larger than ordinary, neighbours unite their horses, bullocks, or milch cows to form a team for the plough. Sometimes the 'dry cotters,' (occupiers of a house without any land,) or small occupiers, take what are termed 'corn acres,' or 'con acres,' i. e., ground hired to raise a single crop of potatoes or oats. In the northern part of the county, the tillage is even worse than that above described. The cattle consist chiefly of milch cows belonging to the small farmers, who cannot give the price for a good heifer: they are, therefore, of an inferior breed. The gentlemen farmers have, however, been desirous of improving their stock by importation. There is, on an average, a cow to each family, without reckoning the population of the towns. Better is the chief object of the dairy: 82,000 firkins from this county and those of Down and Armagh were, in 1827, exported from Belfast. Cheese is made also; that of Carrickfergus is much esteemed. Sheep are little attended to: very little wool is produced for sale, there being no more than is required for domestic purposes. Goats are continually seen round the cabins: they are tethered by a cord fastened to the horns, and put to graze on the tops of the banks. The dog and the pig are inmates of almost every cabin, and may be considered alike as domesticated animals. The number of pigs reared is very great. In the three winter months of 1826-7, upwards of 71,000, averaging 200 lbs. each, were sold in Belfast, fetching from 17. 12s. to 2l. 14s. per cwt. The small farmers depend on them for payment of their rents; and eight or ten are a common appendage to a small farm-yard. (Wakofield's *Account of Ireland*; and *MS. Communication from Ireland*.)

There is a coal mine at Ballycastle in this county, but the coal is of an inferior sort; and one of fossil wood or wood coal at Killymore near Ballintoy on the same coast. English coal is imported into Belfast. Gypsum, marble,

beautiful crystal pebbles, and different sorts of ochres are also found.

The great manufacture of the county is that of linen. Flax was once grown to a considerable extent, more acres (viz., 11,000*) having been devoted to this crop in Antrim than in any other Irish county, except Armagh: but the cultivation of flax has diminished of late years. The seed is almost entirely brought from Holland. It is spun into yarn by the poor females, who are very expert in this branch of industry: yarn spun by the hand is preferred to that spun by machinery, which has been introduced for this purpose, and has caused a great reduction in the price of yarn. The weavers work on their own account, purchasing either spun yarn, or unspun, and weaving it in their own families. Some of them employ journeymen. Others have in their houses two or three looms (costing 4l. to 5l. each) which they let at about 10s. per annum. The weavers sell their fabrics to the bleachers, by whom they are finished, and generally sent to Dublin or London. Some are exported to England unbleached, in order to be completed there. The linsens made in the county of Antrim are narrow, not exceeding when bleached thirty-two inches; those of the width of three quarters of a yard are all made here, for certain widths are peculiar to certain districts. In the neighbourhood of Belfast and Lisburne fine yard-wide linsens or cambrics, lawns and diapers, are made; and at the latter town is also a manufactory of damasks. The linen manufacture, however it may have enriched the middling classes, has by no means raised the condition of the actual manufacturer, whose earnings are commonly below those of an agricultural labourer, so that many have left the loom to go to field labour. The cotton manufacture has flourished considerably in and around Belfast, and affords to the working man far greater advantages. It was introduced by Messrs. Joy and M'Cabe, in 1777, and is not carried on by the weavers on their own account, like the linen, but by men of large capital, for whom the weaver works either at his own house or in a factory. The goods manufactured are muslins, calicoes, wrappings, thicksets, corduroys, and velveteens. The number of persons employed in Belfast, Lisburne, Carrickfergus, and the neighbouring districts, is estimated at 26,000, having about doubled since 1800. To the introduction of the cotton manufacture, and to the commercial importance of Belfast, may be ascribed the improvement observable in the condition of the people who live in the neighbourhood of that town; in which are concentrated nearly all the other manufactures carried on in this county, as well as most of the foreign commerce. [See BELFAST.] There are some salmon fisheries at Custendal, Tor Point near Fairhead, Ballycastle, Carrick-a-rede, and the Bush-foot. The more important one in the Bann near Coleraine rather belongs to the county of Londonderry. Belfast is supplied with oysters and other fish from Carrickfergus.

The population of the county in 1831 (the last census taken) was 323,306: in 1790, Dr. Beaufort (*Memoir of a Map of Ireland*) estimated the inhabitants at 160,000. According to the returns of the Commissioners of Education in 1824-26, the number of children receiving education in schools was 20,050, of whom 11,800 were boys and 8250 girls: 3865 were of the established church, 11,640 presbyterians, 430 dissenters of other denominations, 375 Roman Catholics, and of 330 the religious profession could not be ascertained. The shire town is Carrickfergus, once the first sea-port in the north of Ireland, and then defended by a strong castle, where a small garrison is still kept. The population of the county of the town of Carrickfergus was, in 1831, 8698. Belfast is, however, the place of greatest importance (population 53,287). Both of these are on the north shore of Belfast Lough. Lisburne, on the river Lagan, has a population of 5218; and Antrim, near Lough Neagh, of 2655. [See the Articles on those places.]

The other towns are Larne, on a lough or inlet of the same name, on the east coast, (population 1551,) an inconsiderable place with a poor harbour: Ballymena, (population 4063,) and Ballymony, (population 2222,) a neat little town, with stone houses, and slated roofs, and having a decent inn; (both these are on the road from Antrim to Coleraine;) Ballycastle, (population 1683,) with its coal mine, on the north coast; and Randal's Town, a little to the N.W. of Antrim, and near the shore of Lough Neagh. The

* This return refers to the year 1805, and does not seem to include patches of less than one acre, which are very numerous. It is probable that the acre is the Irish acre, which is equal to more than an English acre and a half.

other places called towns in the population returns have under 700 inhabitants, and are not worth mentioning, except Connor, which contains the ruins of a cathedral, and gives name to the diocese.

The chief antiquities are the above-mentioned cathedral; the round tower at Antrim [see ANTRIM TOWN]; the remains of two other towers, one at Armoyn near Ballycastle, and the other on Ram Island in Lough Neagh; Dunluce Castle, on the coast, not far from the Giants' Causeway; and the ruins of a castle on Rathlin island, which is said to have given shelter to Robert Bruce when driven from his native land. A cromlech and a rocking stone are to be seen in island Magee near Larne.

The county returns two members to parliament: Belfast two; Carrickfergus and Lisburne each one. The number of electors for the county under the Reform Bill of 1832 amounted to 3187, of whom 561 were 50*l.* freeholders; 162 were 20*l.*, and 2209 were 10*l.* Of these 3026 voted at the last general election (of 1832). Antrim gives the title of Earl to the family of Macdonnell. (Wakefield's *Account of Ireland*; Beaufort's *Memoir of a Map of Ireland*; and *MS. Communication from Ireland*.)

ANTRIM, a town in Ireland, in the county of the same name, about 105 miles north of Dublin, and about 15 miles N.W. from Belfast. 54° 13' N. lat., 6° 6' W. long. of Greenwich. It is near the N.E. extremity of Lough Neagh, the largest lake in Ireland, and on the Six-mile Water, a small stream which flows into the Lough. Although Antrim gives name to the county, it is not the shire town, and had, in 1831, a population of only 2655. It was once, however, a place of great consequence, as appears from its having, before the Union, returned two members to the Irish House of Commons, from the mayor being admiral of a considerable extent of coast, and from the corporation having been entitled to the customs paid by all vessels within the limit of the jurisdiction thus enjoyed by the mayor. This grant was repurchased by the crown, and the custom-house was transferred to Belfast. Antrim consists of one long street, with the market house in the middle. The parish church is a modern Gothic structure, with a steeple and spire; and there are a Catholic chapel and several dissenting meeting-houses. The linen manufacture furnishes employment to many of the inhabitants. In the neighbourhood are Shane Castle, the ancient seat of the O'Neils; and Antrim Castle, once the seat of the Skellingtons, Viscounts and Earls of Massereene, and now of Stellington Foster, Earl of Ferrard. The living is a vicarage in the diocese of Connor.

At Antrim is one of the ancient round towers found in many parts of Ireland: it is perfect, and is 95 feet high. The origin of these towers has been keenly disputed by antiquarians: most of them, however, agreeing that they are the work of the Ostmen or Danes. Mr. Ledwich (*Antiquities of Ireland*) supposes them to have been the bell-towers of ancient churches. Other opinions have been broached of late, and by some people received.

This town was the scene of one of the severe contests which occurred during the unhappy civil disturbances in the year 1798: in it Viscount O'Neil, father of the present Earl O'Neil, received a mortal wound. The insurgents were entirely defeated.

ANTWERP, called by the natives Antwerpen, by the Spaniards Amberes, and by the French Anvers, is situated on low ground on the right bank of the Schelde, where the river makes a considerable bend, in 51° 11' N. lat., and 4° 22' E. long. It is about 25 miles in a straight line, nearly due north of Brussels, the capital of Belgium, about 9 miles above Fort Lillo, and 15 miles reckoning to Flushing, at the mouth of the Schelde, where vessels bound to Antwerp must take a Dutch pilot as far as Lillo. The average breadth of the river opposite to the city is about 410 yards, and the ordinary rise of the tide is stated at 10 feet. For the two miles in front of the city of Antwerp the depth at low water is from 32 to 42½ English feet.

Antwerp is a strongly fortified city on the land side, and has, in addition, a large citadel on the south, built by the Duke of Alba in 1568. The houses are generally of a sandstone called *kareelsteen*, brought from Boom, a few miles south of Antwerp. Thus still magnificent, and once still richer and flourishing town, has 26 public places, 70 public buildings, and 162 streets, or, according to other accounts, 212. The great glory of Antwerp is its cathedral, the finest building in the Low Countries: it is said to be 500 feet long,

210 wide, and has a spire of stone, generally said to be above 400 feet high. But accounts differ as to the exact height of this steeple, some making it as much as 451 feet, and even more: of the two spires originally designed, only one is finished. By the kindness of a friend, we are enabled to rectify the height of the spire of Antwerp cathedral, which must be reduced to 366 feet at the outside; consequently it is lower than the spire of Salisbury cathedral, if the height of this English spire can be depended on. The observations on the height of Antwerp spire were made with a mountain-barometer by Jones, and were repeated in order to insure accuracy. Being warned by this example, we will not undertake to vouch for the accuracy of the other dimensions of the cathedral. With a small telescope, objects may be seen pretty clearly from the spire of the cathedral for 40 miles round. The interior is adorned with two of Rubens' finest pictures, one of which, the *Descent from the Cross*, is almost unrivalled in its masterly grouping. The *Hotel de Ville*, or *Town House*, is a large and handsome building, with a front of about 260 feet; and the Bourse, or Exchange, which rests on marble pillars, was the finest building of the kind in Europe, and is said to be the model on which those of London and Amsterdam were built. St. James's church, which contains the tomb of Rubens, a native of the city, the church of St. Michael, the hall of the Hanse Towns, and the imperial palace, built by Napoleon, in the *Mercy*, which is the chief public place, are also fine edifices. The new quay and the great basin of Antwerp were begun by Buonaparte, when he intended to make this city one of his strong naval stations. The area of the great basin is 17,116 English acres, and of the small one, seven. On each side of the great basin are two careening docks, made during the empire of Napoleon for repairing the ships of war constructed here. The new custom-house is at the head of the great basin. Along the whole line of the new quay a row of elms has been planted, for the purpose of ornament and to form a pleasant walk in the heat of summer. In such modes of decorating their chief streets and the environs of their towns, the people of the continent are much superior to ourselves.

Antwerp contains a great military arsenal, dock-yards, and an extensive rope-walk. The citadel is a regular pentagon, surrounded by a wet ditch 90 feet broad: it has five bastions, each containing a casemate capable of holding 100 men. Some years ago it contained the great prison for felons, where (in 1817) about 1000 were in confinement for various periods, some for less than five years, for various offences. They were kept hard at work, but their employments are described as sedentary, and some of the apartments as ill ventilated and disagreeable.

Travellers cannot fail to be struck with some appendages of Catholicism to be seen in the streets of Antwerp. Pious individuals erect, at their own expense, a Madonna with the child Jesus at the corner of the streets, the former exhibited in glaring colours, and the latter with a gilded glory round his head. Napoleon swept away these testimonials of superstition, in which he perhaps showed less policy than the Protestant king of the Netherlands, who restored them.

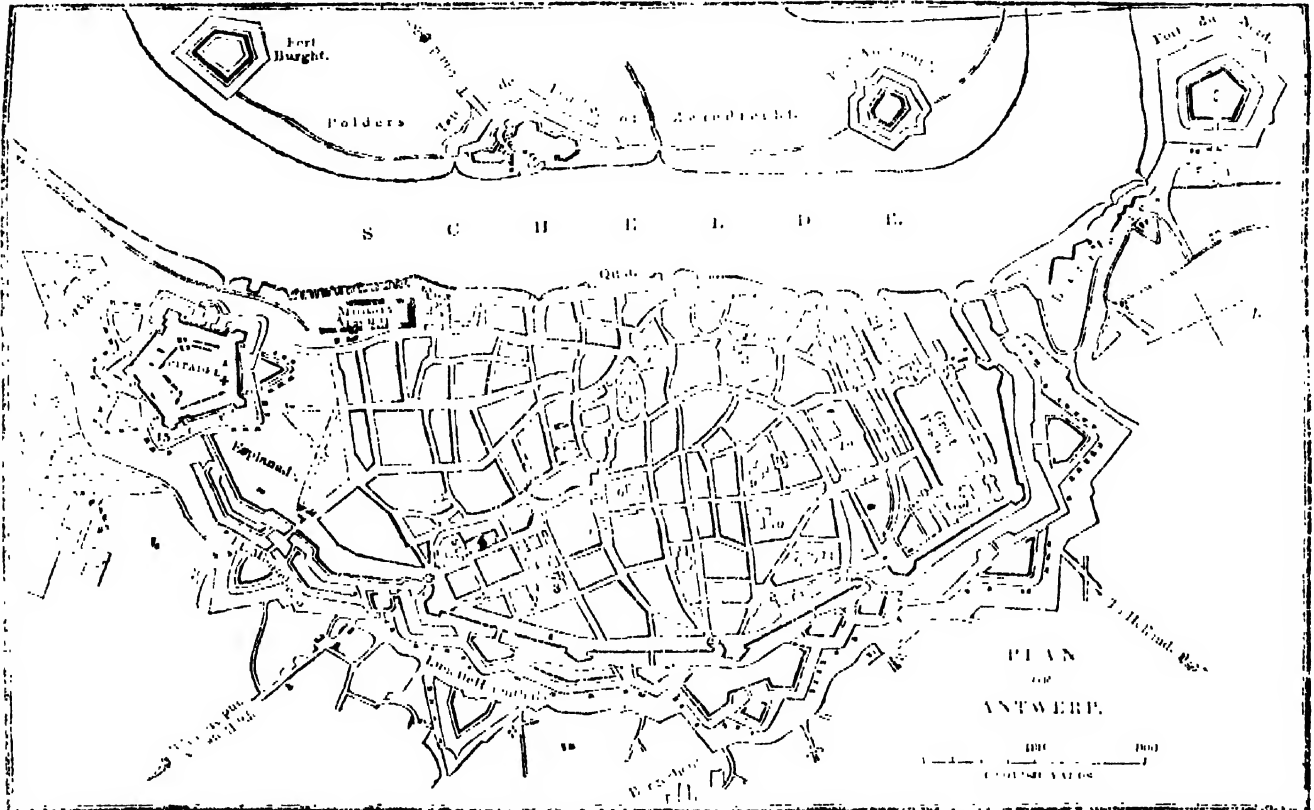

Antwerp, which was the birth-place of Jordaens, Rubens, Vandyke, the Teniers, and of Quintin Masseys, who, as the story goes, was changed by love from a blacksmith into a painter, still possesses many memorials of these illustrious artists in several good collections of paintings. The geographer Abraham Ortelius was a native of Antwerp. It has also an Athenæum, a botanical garden, public library, and an academy of the fine arts.

The commerce of Antwerp is still considerable, though far below what it was in the fifteenth and sixteenth centuries, when at one period it had a population of 200 000, and 2000 vessels annually entered its port. Its population in 1831, according to Dutch authorities, was only 77,199: 995 ships entered its port in 1829; 690 in 1830; and 382 in 1831. A corresponding decrease took place in the number of vessels that cleared out of Antwerp from 1829 to 1831 inclusive. As to its inland trade, Antwerp is connected by canals with Mechlin, Louvain, Brussels, and with Ghent by the Schelde. Its chief fabrics are thread, tape, linen cloth, silks, sugar-refining, calico-printing, and diamond cutting. They use the French coinage at Antwerp, and also the French weights and measures. There is a bank, which is a branch of the Brussels bank. Antwerp exports flax and bark to Great Britain; and madder, refined sugar, and Belgian manufactured articles to other places.

The language which is most in use among the higher classes of Antwerp is the French, but the Flemish is the true language of the country and of the majority of the people.

We are not able to assign the period when Antwerp became a town; the Ambivareti of Cæsar, which is probably a corrupted name, did not live on the Schelde, as Malte Brun, without the smallest reason, supposes. Antwerp, in the eleventh century, was a small republic. The industry of its inhabitants, joined to its favourable situation, raised it to the rank of the first commercial city of Europe, during the reign of Charles V. But during the reign of his un-

worthy successor it suffered among the horrors of Alba's government, and the stormy times that followed the declaration of independence at Antwerp in 1580. In 1576 it was pillaged for three entire days by the Spaniards. The siege of Antwerp, by the Prince of Parma, and its reduction in 1585 after a fourteen months' siege, form an epoch in the history of the city. By the terms of the peace of Westphalia in 1648, the navigation of the Schelde was closed, and this, added to other calamities, destroyed the prosperity of the city. The navigation of the Schelde was opened at the time of the French occupation of Antwerp, which took place in 1792. In 1793 the French evacuated

it, but took it again in 1794, when it became the capital of the department of Deux Nèthes. It was surrendered to the allies after the treaty of Paris in 1814 by Carnot, who had defended it up to this time. The city suffered after the revolution of 1830 from the cannonading which the Hollanders in the citadel directed against the town.

The last memorable event in the history of Antwerp is the capture of the citadel by the French, under Marshal Gerard. The King of Holland having refused to evacuate the citadel of Antwerp, conformably to the terms agreed on by the high contracting powers, who arranged the separation of Holland and Belgium, the French entered Belgium on Nov. 15, 1832, with about 70,000 men, a large part of whom were merely intended to occupy the country round Antwerp. The citadel was defended by General Chassé, for the King of Holland, with 4500 men. The French broke ground on the night of the 29th of November; on the 11th of December, they made a breach in the face of the Fort St. Laurent by establishing three mines in it, and immediately took the place by assault. The French then directed their breaching battery against the Toledo bastion, on which they soon made considerable impression. On the 24th the citadel surrendered, and the garrison became prisoners of war. The defence of General Chassé was neither vigorous nor well concerted, though his artillery was well served; and the only result of the obstinacy of the King of Holland was the loss of much life, and the infliction of much human suffering. The loss of the French, according to official reports, was 108 killed, and 695 wounded. The loss of the Dutch, in killed, wounded, and missing, was between 500 and 600. (See *Journal of an Horticultural Tour, &c., Edinburgh, 1823; Journal of an Excursion to Antwerp, London, 1833, &c.*)

ANTWERP, one of the eight provinces of the kingdom of Belgium, is bounded on the north by N. Brabant, by Limbourg on the East, on the south by S. Brabant, and on the west by east Flanders and part of Zealand. The Schelde separates Antwerp from East Flanders. Its area is about 1105 E. square miles, and the population (1829), 313,214. The following table exhibits the progress of population in the province of Antwerp for the ten years,

From 1803 to 1812,

No. of Births.	Marriages.	Divorces.	Deaths.	Increase of Population.
96,058	21,579	13	87,126	6932

and, from 1815 to 1824,

101,471	23,075	2	70,623	30,848
---------	--------	---	--------	--------

The following statistical facts are from the tables of Vander Maelen (*Etablissement Géographique de Bruxelles fondé par Ph. Vander Maelen en 1830*).

He makes the whole superficies of the province about 1097 English square miles, being eight less than our estimate: the uncultivated land is rather more than one fourth of the whole surface; the surface occupied by water (which is not included under the head of uncultivated land) is nearly 1/3 of the whole.

Population in 1831.

City.	Country.	Total.
122,570	225,220	347,590

Education.

Children in communal schools.		Children in private schools.		Total.
Male.	Female.	Male.	Female.	
11,617	8,557	3,488	3,214	26,906

Therefore one in every thirteen inhabitants is in the schools, nearly.

Antwerp sends to the chambers at Brussels four senators and nine representatives: the province has one archbishop.

The province of Antwerp is very level. The only river is the Schelde, which receives on the right bank the Rupel at Rupelmonde: the Rupel is formed by the union of the greater and smaller Nethe, the Dyle on which Meehlin stands, and the Senne which runs by Brussels. As this region belongs to the great delta of the Rhine, it partakes of the general character of that extensive level: the soil contains a great proportion of sand, with no stones in the flat districts. The rain water penetrates the surface of the earth and is found in the low parts at about ten feet depth, and often much less.

Part of Antwerp exhibits the general productiveness of the Low Countries, but this province contains, perhaps, a larger portion of heath and barren land than any of them except Limbourg, or we may say N. Brabant, as a great part of the moorass of Peel is given to N. Brabant by the treaty of London, Nov. 1831. A part of the barren Kempenland or Campine belongs to the east part of Antwerp. Between Brabant N. Brabant and Antwerp the country is described as flat, sandy, and poor, and in part incapable of cultivation, but improving somewhat as we approach to the latter city: as we come near Antwerp, it is pretty well cultivated. Between Antwerp and Brussels it is generally rich and well-wooded: following the valley of the Senne we find the country very level as far as Vilvorden in S. Brabant. Between Antwerp and Meehlin (which is near the southern limit of the province) the country is well cultivated. The inclosures made by ditches, dykes, and trees, are kept in good order: some live hedges are found, but they are reckoned injurious. Good crops of wheat, rape, and carrots line the road. The houses are strong built of brick or stone, and generally thatched with straw: the roads are paved with broken stones. Many fields of broom may be observed along this road: the stems of the broom after three years' growth furnish fuel for the kitchen or the oven, and are also used in burning bricks: the ground also is found to be in very excellent condition after the broom is cut down, and secures the farmer a heavy crop. The Polders, which consist of the richest grass lands, extend along the Schelde as far down as Zantvliet, and to Bergen-op-Zoom in N. Brabant. These Polders, which are lower than the level of the sea and the Schelde at high water, are protected by dykes: they produce excellent crops almost without any other manure than ashes from wood.

The chief towns of the province of Antwerp are, Antwerp, Meehlin, Lier, Turnhout, Ghent, and Boom. The language of the mass of the people is Flemish, though French is spoken by the educated classes in the towns. From the peace of Baden, 1714, the county and quarter of Antwerp, as the district was termed, (see Busching's *Geography*), belonged to the House of Austria, and formed a part of the Austrian share in the Duchy of Brabant. After the French revolution it was united to France, and formed the department of Deux-Nèthes. In 1814 it became a part of the United Kingdom of the Netherlands: and in 1830 it became a province of the new kingdom of Belgium.

ANUBIS, an Egyptian deity, represented with the head of a fox, dog, or jackal, and a human body. In some Egyptian remains we observe him standing by a bier, on which a mummy is lying. Anubis was the son of Osiris and Nephthys, the wife of Typhon, and sister of Osiris. He appears to have been considered in one sense as the conductor and guardian of departed souls, and in this respect his functions bear some resemblance to those of Hermes of the Greeks, and Mercurius of the Romans. Other resemblances are suggested between this Egyptian deity and Hermes, (the god with the golden wand, *χρυσόραπς*), by the supposition that the element *Anub*, in Anubis, has the same signification as the Coptic *noub*, (see Coptic version, Matt. ii. 11,) signifying gold. (See Jablonsky's *Pantheon Anubis*. For the phonetic name of Anubis as son of Isis, see Salt's *Essay*, &c., pl. iii.)

ANVILLE, JEAN BAPTISTE BOURGUIGNON D., a distinguished geographer of the eighteenth century, was born at Paris in 1697. From his boyhood he showed a strong bias for geographical studies. At twelve years of age, while at college, a map which fell by chance into his hands, for maps were not then so common as they are now, determined his pursuits. He began alone and without assistance to draw maps of the countries mentioned in the Latin classics which he was then studying. For this pursuit he sometimes neg-

lected his regular tasks, and he was once caught in his favourite employment by the professor of his class, who, however, perceiving on the rough sketch before him evident signs of the genius of his pupil, encouraged instead of punishing him. The study of ancient geography continued ever after to be the object of his special predilection. After leaving college, he became acquainted with several learned men of his time, and particularly with the Abbé de Longueurue, a laborious investigator of antiquities, at whose request he set about drawing several maps of France and its various provinces, for the Abbé's work; *Description géographique et historique de la France ancienne et moderne*. At the age of twenty-two, he was appointed one of the King's geographers. Soon after, his map of the kingdom of Aragon was published by desire of the Duke of Orleans, Regent of France, and against D'Anville's judgment, who did not consider it as sufficiently accurate. He was employed by the Jesuits to make an atlas of China for the edition of Duhalde's History of that empire. This Atlas (*Noirel Atlas de la Chine*, &c.) was also published at the Hague in 1737. But the work that established his reputation, was his map of Italy, which he published in 1743. He constructed this map chiefly upon a close investigation of the ancient writers, and of the Roman itineraries: he corrected many gross errors of his predecessors, and the accuracy of his work was proved some years after, when Pope Benedict XIV. having enabled Father Bosovich to measure a degree of the meridian in the papal states, D'Anville's positions were found to correspond pretty closely with the observations of the mathematician. In 1744, D'Anville published his *Geographical Analysis of Italy*, in illustration of his map. In this elaborate work he shows the difference between his and Sanson and Delisle's maps, he having reduced the area of Italy by several thousand square leagues. He drew several maps of sacred geography, namely, *Ecclesia Africana*, and the four Patriarchates of Constantinople, Antiochia, Jerusalem, and Alexandria, for the *Oriens Christianus* of Father Le Quien. It would be too long to enumerate all D'Anville's works and maps, a full catalogue of which is given by Barbié du Bocage in his *Notice des Ouvrages de M. D'Anville précédée de son Eloge par M. Dacier*, Paris, 1802. He published one hundred and four maps on ancient, and one hundred and six on modern geography. He wrote about forty works, including several memoirs, which are inserted in the *Recueil de l'Académie des Inscriptions et Belles Lettres*. The following are the most important among his works, all published at Paris, *Analyse géographique de l'Italie*, 1744, 4to., already mentioned; *Dissertation sur l'Etendue de l'ancienne Jérusalem*, 1747, 8vo.; *Mémoire sur la Carte des Côtes de la Grèce*, 1751, 4to.; *Notice de l'ancienne Gaule, tirée des Monumens Romains*, 4to., 1760; a work much and deservedly esteemed, in which the author, however, confines himself to Gaul as it was under the Roman empire. To this must be added: *Eclaircissements géographiques sur l'ancienne Gaule*, 1743, 12mo.; *Mémoire sur l'Égypte ancienne et moderne, suivi d'une Description du Golfe Arabique*, 1766, 4to. Mr. Ripault, one of the scientific men who accompanied Bonaparte's expedition to Egypt, says that they were struck with the accuracy of D'Anville's positions. Indeed when we look at D'Anville's map of Egypt, and consider what his materials were for constructing it, we readily admit that it is a most convincing proof of his great industry and acuteness. The navigator Bougainville, also gave a similar testimony in favour of D'Anville's map of Asia, especially with regard to the Molucca islands, and the coast of New Guinea. - *Géographie ancienne abrégée*, 1768, 3 vols. 12mo., and 1769, fol., translated into English under the title of *Compendium of Ancient Geography*, London, 1791, 2 vols. 8vo.; *Traité des Mesures itinéraires anciennes et modernes*, 1769, 8vo., a most valuable work, in which he estimates and compares the itinerary measures which have been in use in various ages, among the nations of Europe and Asia, and ascertains the variations which each had undergone in the course of time; *États formés en Europe après la Chute de l'Empire Romain en Occident* 1771, 4to.; a useful book for the history of what are termed 'the dark ages,' from the fifth to the twelfth centuries, and forming a link between ancient and modern geography; *L'Empire de Russie considéré dans son origine et ses accroissements*, 1772, 12mo.; *L'Empire Turc considéré dans son établissement et ses accroissements*, 1772, 12mo. With regard to the geography of Turkey, D'Anville seems to have been fully sensible of the difficulties of the subject, owing to the want of observations, for he

used to say that people in his time 'were better acquainted with the geography of India and China, than with that of the kingdom of Philip and Alexander,' meaning Macedonia; and, in fact, he has himself fallen into considerable errors in his map of that country, as M. Cousinery has shown in his *Voyage dans la Macédoine*. [See AMPHIPOLIS.]

A similar remark will apply to his map of Asia Minor, to the neck or isthmus of which he assigned a breadth from north to south which was less than the truth by one whole degree: this fundamental error necessarily deranged many of his positions, especially in the eastern part of that peninsula. D'Anville's map of the Tigris and Euphrates is still, in some points, the authority on which our present delineations are partly founded; in other, and some important points, he has long since been corrected; but so ignorant are we still of the true course of some of the streams that enter the head of the Persian Gulf, east of the Tigris, that we cannot yet positively say whether D'Anville is right or wrong. In order justly to estimate the merit of D'Anville's exertions, we ought to bear in mind, that in his time geographical information was much more scanty than at present; that comparatively few points of the earth had been determined by astronomical observations; that the surveys of coasts were very imperfect; and that he had, in consequence, but few guides whom he could trust. D'Anville himself had never travelled beyond a hundred miles from Paris; but he made up in a great measure for these disadvantages by his indefatigable researches in the authors of antiquity, as well as of the middle ages, who could afford any information on geographical matters, and by a rare sagacity and judgment in eliciting truth out of conflicting statements and opinions. He was greatly assisted by his wonderful memory. Geography made under him rapid strides towards accuracy; he used himself to say, for he was somewhat of an egotist, that 'he had found a geography made of bricks, and left one of gold.' (See his 'Eloge,' by Dacier, already mentioned.) The maps of D'Anville have been continually reproduced in England in various forms; and errors, which the author could not possibly avoid, often still appear in our ordinary maps.

But it was only on the subject of his favourite science that he showed any vanity: in all other matters he was simple and unassuming. He lived more in the past than in the present, more with books than with men. It is remarked by the biographer of D'Anville, (*Biog. Universelle*, D'Anville,) that his style is not good, and that owing to this and other causes there is often a want of method and clearness in his dissertations. In this opinion we entirely concur: his language sometimes is very inelegant and not very correct, and his discussion of the position of a place would sometimes hardly lead us to expect the precision which we find in his maps. We believe that D'Anville was occasionally more indebted to previous geographers than is generally supposed: in saying this, we do not mean to detract from his real merit, which will stand the test of the most rigorous examination. In 1773 the French Academy of Sciences elected him, then seventy-six years of age, into their body, and the same year he succeeded to the vacant place of first geographer to the king. In 1777 he published his *Considérations sur l'Etude et les Connoissances que demande la composition des Ouvrages Géographiques*, a sort of legacy for those who should follow him in the same career. In 1779 Louis XVI. purchased his valuable collection of maps, which he had collected in the course of sixty years devoted to science. D'Anville's constitution, naturally delicate, became now exhausted, his sight failed, and he at last fell into a state of physical and mental imbecility, from which death relieved him in 1782, at the age of eighty-five. His wife, with whom he had passed fifty-one years of his life, died the year before, without his being sensible of her loss. He left only two daughters. There are two more works translated or compiled in English from D'Anville, besides the 'Compendium' already mentioned, namely *A Complete Body of Ancient Geography*, including the *Orbis Romanus*, *Orbis Veteribus Notus*, of D'Anville, with additions, London, 1775, and the *Geography of the Greeks and the Romans in the time of Alexander and Augustus*, London, 1816.

ANWARI, or ENWERI, properly AWIAD-ED-DIN ANWARI, a celebrated Persian poet, who flourished in the twelfth century of our æra. He was born at Bedna, a village in the district of Abjurd, in Khorasan: the immediate neighbourhood of his place of birth bears the name of Khaweran, whence Anwari is also sometimes surnamed

Khawerani. He received his education in the college of Mansur, at Tus. A visit of the Seljukide sultan Sanjar to Tus furnished him the first opportunity of making himself known by a poem in praise of the sultan, which is by oriental critics considered one of his best productions. Sanjar, who was fond of poetry, enlisted him among his suite, and bestowed honours and ample rewards upon him. Anwari followed the sultan to Merw, then the residence of the Seljukides. Here the poet devoted himself to astrology, but was not fortunate in his predictions, by one of which he made himself so ridiculous that he retired from Merw to Balkh, where he died in the year 597 of the Hegira, (A.D. 1200-1201.) Manuscript copies of the *Diwan*, or collection of poems of Anwari, are not unfrequently met with. It consists chiefly of *kasidas*, or long poems, mostly panegyric; and of *ghazels*, or shorter lyrical effusions. In the East, the *kasidas* of Anwari are admired in preference to his *ghazels*: to our own taste, the latter are more agreeable; in them the style of Anwari is simple and comparatively easy, while his *kasidas* abound in metaphors and conceited historical allusions, which render many of them unintelligible without the aid of a commentary. It deserves to be remarked, that the language of Anwari, though he is one of the earlier Persian poets, is as full of Arabic expressions as that of almost any subsequent writer; whereas, in the *Shahnamah* of Firdusi, who lived only little more than a hundred and fifty years before Anwari, we find the Persian in a state of unadulterated purity. It is unlikely that the spoken language should have undergone so striking a change within so short a period; and we are inclined to think that Firdusi, to preserve the national character of his poem on ancient Persian history, studiously avoided all Arabic expressions which might, at his time, have crept into the Persian language.

ANWEILER, a town in the former duchy of Deux Ponts, and now in the circle of the Rhine, forming part of the kingdom of Bavaria; it is built on the Queich, six miles distant from Landau, and has 2200 inhabitants, who subsist chiefly from the profits of their paper-mills. The ruins of the castle of Trifels, where Richard, Cœur-de-Lion, was kept a prisoner in the year 1193, may be seen in the vicinity of this place.

ANXUR. [See TERRACINA.]

ANYTUS. [See SOCRATES.]

ANZIN, a village in the immediate neighbourhood of Valenciennes (department of Nord) and the seat of the most extensive collieries in France. The coal was discovered in 1731, by the Viscount Desaudrouin. The working of these mines is thought to have been attended with greater difficulties than of any other in Europe. The pits amount to forty all together, and sixteen of these are of great depth; some are as much as 300 metres, or nearly 1000 feet; and some authorities (*Dict. Géog. de la France*) extend them to 389 metres, or nearly 1300 feet. The coal burns fiercely, and is in demand for purposes which require an intense flame; and it is perhaps to this circumstance that we may ascribe the establishment of some glass houses and manufactories at Anzin. The number of persons employed in the mines amounts to 16,000, and the annual produce is about 4,000,000 of quintals (of 108 lbs. avoirdupois). Comparing the above statements with those given in the *Dictionnaire Géographique de la France*, (1804,) it appears that the working of these mines has prodigiously increased; for at the last mentioned period only 1500 workmen were employed. The population of the village was then 3096; it is now about 4000. (Malte Brun; Balbi; *Dict. Geog. de la France*.)

ANZUAN, commonly called Johanna, but more properly Hinzuan, the name given to it by the inhabitants, is one of that cluster of islands which are situated in the channel of Mozambique, nearly at an equal distance from the continent of Africa and the island of Madagascar, and which are known by the name of the Comoro Islands. Though not the largest of these islands, being smaller than Comoro, Anzuan is the most important, from having the best anchoring-ground, on which account, before the acquisition of the Cape, it was much more frequently visited by English vessels trading to the East Indies and China, than has lately been the case.

This island is of a triangular form. The most southern point lies in 12° 25' S. lat., and the most eastern in 44° 31' E. long., and to the north it extends nearly to the 12th southern parallel. Its circumference is estimated at from seventy to eighty miles; as to area it may be compared to the island of Madeira, which it resembles in many other points.

The shore rises in many parts with remarkable boldness,

and is broken by a few open bays. Rocky reefs extend from its extremities far into the sea; and from the south-western to the north-western point it is bounded by a reef which is two miles from the shore in many places. The interior of the island presents a succession of mountains and valleys. The mountains are of volcanic origin and some of them rise to a considerable height, probably to 6000 feet and upwards; among the highest is that called the Peak, which is rather of an oblong form and situated near the eastern extremity of the island. With the exception of the highest summits, which present barren rocks, the mountains are covered with trees, chiefly fruit trees and palm-trees. The valleys are rather narrow, but they contain in some places much level ground which is partly cultivated, and partly planted with trees. The continually changing variety of the landscape offers many highly picturesque views, and Sir William Jones does not hesitate to give them the preference over the finest views in Switzerland and Wales.

Though exact observations are wanting, the climate appears to be mild, the heat at least not being oppressive even in July.

Rice is raised, but not in large quantities. A kind of yetch is much more cultivated; and forms the principal food of the inhabitants. Yams, papayas, and sweet potatoes, abound in the kitchen-gardens. The fruits consist principally of cocoa-nuts, limes, oranges, wild pine-apples, and plantains. The area-palms are numerous, as well as the shrubs that yield henna: the fruits of the former and the leaves of the latter are used here as in India.

Not a horse is to be found on the island, and persons of rank travel in rudely constructed palankins. Cattle are numerous and excellent, but rather small, weighing only from 300 to 350 lbs. each. Goats abound, and a wild species inhabits the most rugged eminences. Poultry is very common, and of the Guinea-fowls thousands may be seen in a wild state. No snakes, nor other venomous reptiles exist in this island: the only annoyance of the inhabitants is the mosquitoes. Fish abounds everywhere along the shore. White whales frequently visit the channel of Mozambique, and are often killed by the inhabitants of this island. Cowries are found on the shores in the neighbourhood, and form an article of export.

The population consists of Africans and Arabs. The latter, who compose the upper classes, have introduced their religion, laws, and a part of their knowledge, especially of navigation. But the Africans, who compose the bulk of the population, are very ignorant, and very little advanced in civilization. The government is a monarchy limited by an aristocracy. The king has no power of making war by his own authority; but if the assembly of nobles, who are from time to time convened by him, resolve on a war with any of the neighbouring islands, they defray the charges of it by voluntary contributions: in return for which they claim as their own all the booty and captives. As the succession to the title and authority of sultan is not fixed by unalterable laws, but requires the confirmation of the chiefs of the island, it gives rise to factions, and occasions frequent civil wars, which, together with the depredations of pirates from Madagascar, have lately much reduced the number of inhabitants, who formerly were estimated at about 100,000.

The town of Matsamudo, which lies at the end of an open bay, is visited by European vessels for refreshment, and is populous. But the king resides in another town, called Domoni, which is ten miles from Matsamudo, in the interior of the island. The trade of this island is very inconsiderable. It sends nothing to the markets of Europe, but has some intercourse with the island of Madagascar, the coast of Mozambique, and the other Comoro islands: it exports the merchandises received from the Europeans returning from Bombay, which it exchanges for elephants' teeth, rice, cattle, and other productions. (Sir William Jones: Capt. Williamson; and Horsburg's *Directory for Vessels sailing to and from India*.)

AORTA, a Greek word (*ἀορτή*). The aorta is the great vessel from which all the arteries of the body which carry red blood derive their origin. It arises from the upper and back part of the left ventricle of the heart. Its origin is directly opposite the lower margin of the cartilage of the third rib on the right side of the chest. From this point it ascends behind the pulmonary artery, still inclining a little to the right side of the chest. It continues to ascend as far as the top of the second vertebra of the back. All this part

of the vessel is called the *aorta ascendens*. When it reaches as high as the lower margin of the first rib, it bends obliquely backwards towards the body of the third vertebra of the back. This part of the vessel is called the *curvature*, or the transverse *arch* of the aorta. From the third vertebra of the back, where its arch terminates, it proceeds in a straight course downwards through the chest, immediately in front of the spinal column, and towards the left side of it. Through an opening formed for it in the diaphragm, (see *DIAPHRAGM*,) it passes from the chest into the abdomen. All this part of the vessel, namely, that extending between the termination of the arch and the diaphragm is denominated the *descending* or the *straight* portion of the thoracic aorta. Having passed through the diaphragm into the abdomen, it is called the abdominal aorta: it continues to descend along the front of the spine a little obliquely, until it reaches the fourth vertebra of the loins: here it divides into two branches of equal size, and may be said to terminate, for it now loses the name of aorta; the two great branches into which it divides being denominated the *common iliac arteries*.

The first two branches which are given off by the aorta are those which supply the heart itself. The great branches which spring from the arch of the aorta are principally distributed to the chest, head, and upper extremities. The branches which arise from the descending or the straight portion of the thoracic aorta are likewise distributed to the viscera of the thorax, those which supply the lungs being called the *branchial* arteries. The branches which are given off from the abdominal portion of the aorta supply, for the most part, the viscera of the abdomen; and the iliac arteries are distributed principally to the viscera of the pelvis and to the lower extremities.

The structure of the aorta does not differ materially from that of arteries in general (see *ARTERY*). At its origin, in the left ventricle of the heart, are placed three valves of a semilunar or crescent shape, termed the semilunar valves, (see *HEART*;) which effectually prevent a reflux current of blood from the vessel into the heart.

The aorta is subject to numerous and important diseases, as inflammation, aneurism, ossification, &c. [See *CARDITIS*, *ANEURISM*, *OSSIFICATION*, &c.]

AOSTA, the duchy of, one of the five divisions of Piedmont, or rather, speaking more accurately and according to the present administrative system of that country, one of the eight divisions of the continental states of the King of Sardinia. It consists chiefly of one long valley of the same name, which follows the course of the Dora Baltea. This river, from its source in the Graian Alps, runs first eastwards for about thirty-five miles, and then turns abruptly southwards, below Chatillon, flowing in the same direction to the village of St. Martin, where it enters the province of Ivrea, on its way to the Po. Many smaller valleys open into the main one on both sides, following the course of the mountain streams which flow from the Upper Alps into the Dora. The principal are on the north side, the Val Lesa, which begins at St. Martin on the Dora and extends up to the glacier of Lys, at the foot of Mont Rosa; Val Challen, called also Val d'Ayas, beginning at the town of Verrez, the Vitricium of the Romans, and stretching likewise northwards to the glaciers of the same range; Val Tournanche, which begins at Chatillon and runs to the foot of Mont Cervin, to the eastward of which is a pass, called the Joch, perhaps the highest in Europe, and leading to Visp in the Valais; Val Pellina, which extends north-east of the city of Aosta, along the base of Mont Velan and Mont Combin to the Col d'Oren, over which there is another pass, nearly 8000 feet high, into the Valais; the Val du Butier, so called from the torrent of that name, which leads from Aosta to the Great St. Bernard. Ascending the Dora from the city of Aosta towards the foot of Mont Blanc, the main valley branches out into several high and narrow glens: of these the Val d'Entrevies contains the village and the baths of Cormayeur, from whence a pass leads northwards over the Col de Ferret into the Valais; and the Val Veni, called also Allée Blanche, skirts several vast glaciers that descend from the range of Mont Blanc, and leads to the Col de la Seigne, over which there is a pass into Savoy. Here the Dora has its source in the little lake Combai. Another stream, coming from the south-west, joins it at Pré St. Didier, a village with mineral waters. The valley that follows this stream, and leads to the pass of the Little St. Bernard, is called Val de la Tuile. This is the best and the easiest of all the passes leading from the Val d'Aosta over

the Alps. A lofty summit, called the Cramont, covered with perpetual snow, divides the Val de la Tuile from the Allée Blanche. The other valleys that branch out of the main one south of the Dora are: Val Grisanche, which leads from the village of Livrogne to the great glacier of Ristour, embedded in a lofty group of Alps that projects eastward of the Graian range between the Little St. Bernard and Mont Iseran; Val Regence, called also Val di Reima, which leads in a parallel direction; Val Saveria Vecchia, or Saveranche, leading from Villeneuve, on the southern bank of the Dora, to the foot of Mont Iseran; Val di Cognà, extending from Aosta to Mont Soana, an offset from the great chain of Mont Iseran, which incloses the province of Aosta on the south; a passage for mules leads over Mount Soana to the valley of the river Ora in the province of Turin; and, lastly, Val Cumporeier, which stretches along the same range, and opens to the right bank of the Dora, nearly opposite St. Martin.

Each of these valleys contains villages and hamlets; several hamlets are ranged in groups on the side of the mountain, and the principal one of the group is distinguished by the parish-church. The lower parts of the valleys are very fertile: they produce little wheat, but plenty of barley, oats, and rye, all sorts of fruit, and above all, rich pastures, which feed a great number of cattle and flocks of sheep. The Val d'Aosta supplies the neighbouring province with butchers' meat, butter, and cheese. Most of the cheese, however, is made by Swiss shepherds from the Valais, who come down by the St. Bernard and buy the milk of the farmers. The peasants of Aosta are industrious: most of them are possessed of some land, and those of the upper valleys, who are the poorest, emigrate for the winter, and earn their bread by various callings in the neighbouring countries, from which they return in summer for the labours of their scanty fields. Some have mules, and act as carriers or guides across the Alps; others are tanners. A considerable transit trade is carried on between Switzerland and Italy by the St. Bernard, which is the most direct communication between Bern and Turin. The vine thrives on the lower hills, which have a southern aspect, and some of the wines of the Val d'Aosta, especially those of Chambava, Donax, and Carema are not inferior to those of Montferrat; there is some very good muscadel among the rest. In the Val d'Aosta there are all seasons and climates within a short range. On the Alpine summits are perpetual ice and snow; next are forests of firs and larches; lower down, chestnut and walnut-trees; then vines; and, lastly, the olive, almond, fig, and mulberry-trees growing in all the luxuriance of the south. The traveller who descends the St. Bernard finds at once the climate and the sky of Italy, he hears the shrill cicala, and feels a sun as hot as that of Naples.

The river Dora and the other streams afford excellent trout. The duchy of Aosta is rich in iron, copper, and lead ore. There are iron works at St. Vincent, near Châtillon, at Monjoyet, at St. Marcel, at Gressan, at Cognà, La Tuile, &c. There is manganese in the Val de Challant, as well as salt-pits, and cobalt and crystal. There is also abundance of mineral springs. Gold-mines are reported to have been worked in the time of the Romans, but all traces of them are now lost: particles of gold, however, are found in the streams, especially in the Evançon, which flows through the valley of Challant, and Saussure says that some of the peasants in his time gathered them in a considerable quantity out of the sand.

The people of these secluded valleys are an honest, quiet, and civil race, who speak a dialect different from the Piedmontese, but resembling rather the romance *patois* of Savoy and western Switzerland. Most of them, however, understand French, and speak it well enough for common purposes: Italian is like a foreign language here, although it is the language of the government, and, as such, spoken by all civil officers and magistrates. The country people retain their old costume; the men wear long frocks of blue, red, or green cloth, short breeches, and worsted stockings of the same colours, buckles to their shoes, and huge cocked-hats. The women wear black or white caps, fastened under the chin, which serve partly to conceal the *goitres*, or wens, with which most of them are more or less afflicted. This is a misfortune which the people of Aosta have, in common with their neighbours of the Lower Valais, north of the St. Bernard: many of them are idiots. This disease is ascribed by some to the water they drink, and by others to the thick, damp

vapours which remain stationary in these deep and narrow valleys. (See CRETINS.) A French traveller, Raoul Rochette, states, that while the Val d'Aosta was under the French civil code, and all the children, female as well as male, shared the paternal inheritance, it was observed that Cretinism gradually diminished, the young women consulting their own taste in the choice of their husbands: but under the present Piedmontese law of succession, daughters being deprived of inheritance are induced to contract marriages with Cretins, in order to secure a subsistence, and this is said to have visibly forwarded the spread of goitres. The duchy of Aosta, although small in extent and population, is one of the most interesting provinces of North Italy to the traveller and the naturalist. It lies at the foot of the highest summits in Europe: Mont Blanc, Mont Iseran, the St. Bernard, Mont Combin, Mont Cervin, and Mont Rosa tower above it, and almost inclose it with their glaciers. It is bounded on the north and north-west by the Pennine chain; on the west and south-west, by the Graian Alps; on the south, by a projection from the latter; and on the east, by an offset from the range of Mont Rosa, which separates its easternmost valley, the Val Lesa, from the neighbouring province of Valsesia, in the division of Novara. Over this last range is the pass of Col Vuldobbia, above 7000 feet high, affording a communication between the two provinces. A hospice has been lately built on the summit. It is only at the south-eastern extremity of the duchy of Aosta that the mountains leave an outlet into the lowlands of Piedmont, through which the Dora makes its way, and by the side of the river is the only road passable for carriages. The pass is often confined between the mountain on one side and the river on the other. Near Monjoyet, King Charles Emmanuel III. had the rock cut out to widen the road. Lower down, between Bard and Donax, the rocks have been cut vertically to the height of thirty feet, and a road twelve feet wide has been thus made with a parapet on the river side, chiselled out of the rock itself: this work is ascribed to the Romans. A column, eight feet high and two in diameter, is sculptured in relief on the side of the mountain, bearing the number XXX. The fort of Bard, now destroyed, rose high above the village of the same name, and completely commanded the pass. The French army under Bonaparte, coming down from the St. Bernard, in May, 1800, was stopped here for several days, by an Austrian garrison of 400 men: the delay might have proved fatal to the conqueror, if the French soldiers had not found means to cut a path over the mountain above, and thus turn the fort; the artillery was hurried through the village in a dark night under a shower of balls from the castle.

The Salassi, a Celtic tribe, are the first inhabitants of these regions mentioned in history: Strabo (book iv.) gives an account of them. They fought repeatedly and bravely against the Romans: they were defeated in the year 718 B.C., by Marcus Valerius Messala, who was obliged to winter among the Alps. The poet Tibullus accompanied Messala in this expedition, to which he alludes in his panegyric of his patron. The Salassi having revolted again, Augustus sent Terentius Varro, who carried on a war of extermination, and completely subdued them; 36,000 of both sexes were sold as slaves at Eporodia (Ivrea). Augustus sent afterwards a colony of 3000 Prætorians, who built the town of Augusta Prætoria, now Aosta. Terentius Varro, having also subdued the Centrones on the other side of the Graian Alps, that country took the name of Tarentasia, which it still retains. Augustus made a carriage road over the mountain, now called the Little St. Bernard, which became the great line of communication from Milan to Vienne on the Rhone. Traces of this road are still to be seen in the Val d'Aosta. After the fall of the empire, the country passed under the dominion of the Goths, the Langobards, and the Burgundians; and lastly, of the Counts of Savoy. Amadeus III., in the thirteenth century, conquered the valley of Aosta, whose inhabitants had insulted and imprisoned his messengers. The Emperor Frederic II., on his passage by Turin, granted Amadeus the title of Duke of Aosta, which was borne in the last century by the second son of the King of Sardinia. The last who had it was Victor Emmanuel, who afterwards became king, and who abdicated in 1821. The duchy of Aosta, being one of the oldest Italian possessions of the House of Savoy, preserved its integrity, its separate administration, and its own laws, and usages. The whole division, province, or duchy,...

for, in this instance, they are all synonymous terms,—contains 73 communes, forming seven *mandamenti*, or districts, under one intendant general. The population, by the census of 1826, was 64,640 inhabitants. The length of the province from east to west is 55 miles, and its greatest breadth is 30 miles; but the great inequalities of the ground add largely to the extent of its surface, one half of which, however, is occupied by barren mountains and glaciers. (Sausure, *Voyage dans les Alpes*; Millin, *Voyage en Savoie et en Piémont*; Della Chiesa, *Istoria del Piemonte*.)

AOSTA, (la Cité d') the capital of the duchy of the same name, is built on the left, or northern, bank of the Dora Baltea, and at the confluence of the Butier, the water of which is made to flow through the middle of the streets. Most of the houses have gardens and orchards; the streets are wider and more straight than in the generality of old towns; and the extent of the city consequently appears large in proportion to its population, which, by the census of 1826, was only 5500. Aosta is the residence of the *intendente* of the province, and the seat of the courts of justice; it has likewise a bishop's see and a chapter, three parish-churches, besides the cathedral, a large, old, Gothic structure in which is the monument of Thomas, Count of Savoy, who died here in 1232. In the eastern part of the town are some arches with pillars and other remains of the ancient amphitheatre, the arena of which is now covered with grass and trees. The cellar of a neighbouring convent was formerly the dens of the beasts, and communicated with the arena by subterraneous passages. At the north-west angle of the town is a round tower, which appears to have been intended for a mausoleum. In the city walls, as well as on the outside of several houses, are seen stones and slabs taken from the old Roman buildings. At the entrance of the town, on the road to Ivrea, stands a single triumphal arch of Roman architecture; it is built of a kind of pudding-stone, and the marble with which it was eased having been removed, no inscription or ornament remains, except fragments of the *frieze* and the lateral pillars. Aosta is pleasantly situated at an opening made by the meeting of several valleys, and in a fertile country. It is nearly 2000 feet above the level of the sea, and is 50 miles N. by W. of Turin and 65 miles S.E. of Geneva, in 45° 45' N. lat., and 7° 16' E. long. Anselm, Archbishop of Canterbury under William Rufus and Henry I., a man of considerable learning for his age, was a native of Aosta. Bernard, of Menthon, in Savoy, the founder of the Hospice of the St. Bernard, was Archdeacon of the cathedral of Aosta.

APANAGE, (*Apanagium*, *Apanamentum*.) the provision of lands or feudal superiorities assigned by the kings of France for the maintenance of their younger sons.

The prince to whom the portion was assigned was called the *apanagist*; and he was regarded by the ancient law of that country as the true proprietor of all the seigniories dependent on the apanage, to whom the fealty (*foi*) of all subordinate feudatories within the domain was due, as to the lord of the 'dominant fief.'

Under the first two races of kings, the children of the deceased monarch usually made partition of the kingdom amongst them; but the obvious inconvenience of such a practice occasioned a different arrangement to be adopted under the dynasty of the Capets, and the crown was permitted to descend entire to the eldest son, with no other dismemberment than the severance of certain portions of the dominions for the maintenance of the younger branches of the family. Towards the close of the thirteenth century the rights of the apanagist were still further circumscribed: and at length it became an established rule, which greatly tended to consolidate the royal authority in that kingdom, that, upon the failure of lineal heirs male, the apanage should revert to the crown.

The period at which this species of provision was first introduced into the law of France, the source from which it was borrowed, and the origin and derivation of the term itself, are matters on which the historical antiquaries of France seem not to be agreed. (See Pasquier's *Recherches*, lib. ii. cap. 18, 19, viii. cap. 20; Calvin's *Lex Jurid.* 'Apanagium'; Ducange, *Gloss.* 'Apanamentum'; Pothier's *Traité des Fiefs*; and Henault's *Hist. de France*, Anno 1263.)

By a law of 22d November, 1790, it was enacted, that in future no apanage *real* should be granted by the crown, but that the younger branches of the royal family of France should be educated and provided for out of the civil list until they married or attained the age of twenty-five years; and

that then a certain income called *rentes apanagères* was to be granted to them, the amount of which was to be ascertained by the legislature for the time being.

'It is evident,' says Mr. Hallam, 'that this usage, as it produced a new class of powerful feudatories, was hostile to the interests and policy of the sovereign, and retarded the subjugation of the ancient aristocracy. But an usage coeval with the monarchy was not to be abrogated, and the scarcity of money rendered it impossible to provide for the younger branches of the royal family by any other means.'

'By means of their apanages and through the operation of the Salic law, which made their inheritance of the crown a less remote contingency, the princes of the blood royal in France were at all times (for the remark is applicable long after Louis XI.) a distinct and formidable class of men, whose influence was always disadvantageous to the reigning monarch, and, in general, to the people.' (*Middle Ages*, vol. i. p. 121, 2d edit.)

APATITE, a mineral substance crystallized in the regular six-sided prism, usually terminated by a truncated six-sided pyramid. It occurs variously modified by the removal of its lateral sides and angles. Its specific gravity varies from 3.25 to 3.5. It is scratched by feldspar, but scratches fluor-spar. In colour it passes from white, through various shades of yellow to green and blue, and some specimens possess a red tint; it is usually translucent, but rarely transparent. From the analysis of Gustav. Rose, apatite appears to be a compound of phosphate of lime with fluoride of calcium, in which the fluorine is more or less replaced by its isomorphous element chlorine. Its constitution may be expressed by $3(3Ca + Ph) + (Ca + Fl, Cl).$

This mineral principally occurs in the primitive rocks, and is found in the tin veins of St. Michael's Mount, Cornwall, and also in those of Bohemia and Saxony. It has also been observed in a massive mineral called phosphorite, which appears to possess a similar chemical constitution, and has been found abundantly in beds alternating with limestone and quartz, near Logrosan, in Estramadura in Spain.

APLOME. [See GARNET.]

APE, (*Pithecius*.) in zoology, a genus of quadrumanous mammals, which closely approaches to the human species in anatomical structure, and is justly regarded as the connecting link between man and the lower animals. The word ape seems to be of doubtful origin: in German it is *affe*, from which the verb *affen* appears to have come: this is, perhaps, more probable than to suppose that *affe* comes from *affen*. The name exists, with very slight variation, in all the modern languages of Teutonic origin; as *ape* in English, *affe* in German, *aup* in Dutch, &c.; these, also, are the only European languages which possess original appropriate names to distinguish these animals from monkeys in general. Our own language is even more copious than others in terms for distinguishing the different characters of this class of animals: thus we say that an *ape* is a monkey without a tail, and a *baboon* a monkey with a short tail, reserving the term *monkey* more particularly for those species which have very long tails; and though our early writers use these three words indiscriminately as synonyms, and apply them indifferently to the same animal, yet the significations here given have generally prevailed since the time of Ray, and are now exclusively adopted. It must be confessed, however, that these significations are extremely vague, and certainly do not express the zoological relations which subsist between the different sections of this group of animals. Naturalists, therefore, being under the necessity either of inventing new names, or of changing the meaning of the old, have, in the present instance, preferred the latter, and though the change may at first be disagreeable, language and science will be ultimately benefited by its adoption.

According to its modern zoological definition then, the genus *Ape*, or *Pithecius*, comprises those quadrumanous mammals which have the teeth of the same number and form as in man, and which possess neither tails nor cheek pouches. This definition, whilst, on the one hand, it excludes certain tailless baboons and monkeys, comprehends, on the other, the three subgenera of oranges, chimpanzees, and gibbons, which, though considered by many good zoologists as generically distinct, yet differ from one another by characters too slight to warrant their separation. Nor are these the only characters which the apes share in common. They, of all other animals, approach most nearly to the human species in organization: indeed, as far as can be

judged from the young subjects usually brought to Europe, their most essential difference in this respect consists in certain modifications of the extremities, which diminish their power of walking with ease on a level surface, but which are admirably adapted to increase their faculty of climbing and grasping. The arms are so long as almost to touch the ground when the animals stand erect on their hind legs; but the legs themselves are scarcely one third of the entire height. The legs, moreover, are not in the same line with the thighs; the knees are turned outwards, and the feet are articulated at the ankle in such a manner that their soles turn inwards so as to face or be opposed to one another. By these means the apes are enabled to embrace or grasp the trunks and branches of trees with much greater force than if their members were constructed like our own: they thus become essentially sylvan or arboreal animals, and never voluntarily abandon the forests, where they find at once the most congenial food and the most perfect security.

Their whole organization peculiarly adapts the apes to these habits. Beside the conformation of the extremities just noticed, the fingers and toes are long, flexible, and deeply separated from one another, and the thumb, or interior finger, is completely opposable to the other four, as well on the posterior as on the anterior extremities; thus, their feet and hands are equally formed for prehension. They are not quadrupeds, as Buffon has justly observed, but quadrumana; not four-footed, but essentially four-handed animals. One part of their organization renders them intermediate between the bats and ordinary mammals; another, makes them the connecting link between man and the inferior animals. The great length of the fingers and anterior extremities, compared with those behind, are precisely what we observe among winged mammals, only that the fingers are not connected by a flying membrane; and their economy and habitat equally correspond with this intermediate structure. They are neither confined to the surface of the earth like the generality of mammals, nor do they possess the power of elevating themselves into the air, like the bats; but they choose a middle habitat, the forests, where they habitually reside, and where they move about with an ease and velocity which can only be compared to actual flight. On the other hand, when compelled by circumstances to traverse any part of the earth's surface, their pace, properly speaking, is neither that of a biped nor of a quadruped: they do not walk upright like a man, nor yet do they walk upon all fours like the lower animals. The great length of their arms prevents them from adopting either of these modes of progression in its simple form, but they avail themselves of this very circumstance in another manner: their long arms serve them instead of crutches, and their pace is precisely that of a lame man who walks with the assistance of these instruments. From the oblique articulation of the posterior extremities, they rest only on the outer edge of the foot, but the wavering equilibrium thus occasioned is secured by the long fore arms, which can easily touch the ground in all directions; and, when an advance is to be made, it is accomplished by resting the weight of the body upon the half-closed fists, and then swinging the hinder extremities forward, precisely like a man on crutches. In their native forests the extreme length of their fore arms is turned to the greatest advantage: here it acts upon the principle of the rope-dancer's balancing pole, and completely secures their equilibrium even with the most precarious footing. Thus it is that travellers have seen the apes poised at the very extremity of the slender trunks of the bamboo, waving their long arms from side to side, with the most graceful and easy motions.

Another circumstance in the structure of the apes, in which they differ from most other quadrumana, has considerable influence upon their habits: this is the entire want of a tail. Though the presence of this organ does not always indicate a corresponding function, and though its absence is not confined to this group of quadrumanous animals, yet a long tail would seriously embarrass the nearly erect motion of the real apes: whilst its use is in other respects superseded by the length of the fore-arms, which supply its place in adjusting the proper balance of the body, the only function which the tail performs in the common monkeys. But another character of still greater importance distinguishes the real apes from the rest of the quadrumana, viz., the want of cheek-pouches. These are sacks or cavities in the cheeks, which open inside the mouth between the cheek and the lower jaw, and serve to hold

any extra provision which the animal may not at the moment require. The Semnopithecii alone, of all the other monkeys of the old world, resemble the apes in this respect, and hence arise some of the most striking resemblances which the characters and habits of these two genera present. In other respects they are sufficiently distinguished from one another, by the long tails of the Semnopithecii, not to mention their extremities of nearly equal length, and the peculiar structure of their stomachs and teeth. The nature of the influence which the possession of these cheek-pouches exerts upon the characters and economy of animals will be explained under the articles MONKEY, BABOON, &c.; it is here sufficient to observe that they are wanting in the apes. Another character which is common to all the other known quadrumanes of the old continents, is found in some species only of the real apes, and absent in others: this is the possession of callosities, which are naked callous parts of the buttocks, upon which these animals sit, when fatigued by the violent and rapid movements which they habitually execute. Illiger and some other zoologists have considered this circumstance of sufficient importance to warrant the separation of the apes into two distinct genera, the one characterized by the absence, the other by the presence of callosities; but it is to be observed that, even where these organs do exist in the apes, it is always in a rudimentary form; they are never developed to such an extent as to influence the habits of the animals, and are, consequently, unfit to be considered as generic characters. In other respects, except in these diminutive callosities, the gibbons do not differ from the orangs and chimpanzée: they have the same system of dentition, the same organs of sense, and the same singular modification of the locomotive organs; their manner of life also is precisely the same; both equally take up their habitation in the thickest and most solitary forests, inhabit the same countries, and live upon the same food.

The teeth of the apes, as indeed of all the other monkeys of the old world, are of the same number as in man; nor, as far as the incisors and molars are concerned, do they present any difference in form; but in the adult animals, and more especially in the old males, the canines are developed in the same relative proportion as in the carnivora; the tusks of the full-grown orang-outang are at least as large as those of the lion, and are most formidable weapons. Unfortunately we know but little of the manners of these animals in their adult state; but this circumstance gives us strong reason to suppose that the extreme gentleness and placidity observed in the young individuals usually brought into Europe do not always continue to characterize them in their native climates, but that their disposition alters in proportion to the development of their muscular force, and that in their adult state they are as formidable and mischievous as the baboons themselves. In all other respects their anatomical structure so closely resembles that of man, that it is only of late years, and from such trifling discrepancies as the existence or non-existence of a small intermaxillary bone, of a very small perforation in the vertebra of the os sacrum, &c., that anatomists have ascertained that the dissections of Galen were performed not upon the human subject, but upon the magot, or, as it is usually called, the Barbary ape; so perfectly conformable are his descriptions to the structure of the human frame.

The characters and habits of the apes present differences which will be noticed in speaking of the several species. As far, however, as their general manners have been observed, they appear to be of a grave and gentle disposition, totally free from that petulance and mischievous curiosity which so strongly characterize the monkeys, properly so called, very affectionate towards those who treat them kindly, solemn and deliberate in all their actions, extremely circumspect and intelligent, seldom moved to violent passion, but peevish and fretful when crossed or disappointed. They never walk on two legs except when they have occasion to use the fore-hands in carrying something. Nearly, or altogether deprived of callosities, they do not repose in the manner of ordinary monkeys, on their hams, but stretch themselves on their sides, like human beings, and support their heads upon their hands, or by some other means supply the use of a pillow.

A remarkable singularity in the organic structure of certain species of apes has been observed by Sir Stamford Raffles and M. Duvaucelle, to whose researches in the island of Sumatra we are indebted for the greater part of

our knowledge regarding the *gibbons*, or that section of the genus which approaches the lower tribes of monkeys by the possession of rudimentary callosities. It consists in the connexion of the index and middle fingers of the hind hands, which are united as far as the last or nail joint, and are, consequently, incapable of separate or individual motion. The species in which this singularity was first observed has even been named by Sir Stamford Raffles *Simia syndactyla*, from this circumstance; but if the observations of M. Duvaucelle are to be relied on, it would appear, that the conformation is by no means peculiar to this species. It was the opinion of that naturalist, that the females of most, if not of all the gibbons, partake of the same structure, whilst it is supposed to exist in the male of the *Simia syndactyla* alone. Now it must be observed with regard to this opinion, which certainly does not appear to be well-founded, that besides the physical improbability of the males and females of the same species differing in so important a point of their organic structure, a difference of which there is no other known instance throughout the entire class of mammals, M. Duvaucelle's opinion amounts, after all, to a mere conjecture, since he infers the identity of the species to which he attributes this sexual difference, only from the circumstance of having procured his specimens at the same time and in the neighbourhood of one another. The female of the *Simia lar*, also described by the accurate Daubenton, and supposed by MM. Duvaucelle and Frederick Cuvier to be the same as the ounko of the former naturalist, was certainly devoid of this character, expressly assigned to the female ounko, and differed in many other respects, as will appear in the sequel. If, therefore, we admit on the one hand, that M. Duvaucelle's observations establish the existence of this organic singularity in other species besides the *Simia syndactyla*, it appears probable on the other hand, that this gentleman was led into error in attributing it to the females only, from having too hastily considered as sexual differences merely, distinctions which are in reality the characters of different species. This view strips the case of its most serious difficulties; for, as far as the mere union of the fingers is concerned, though it is certainly a remarkable circumstance in the organization of animals so high in the scale of existence as the apes, that modification is by no means peculiar to these animals. The greater number of the marsupial quadrupeds of New Holland, the kangaroos, pottoos, koulas, phalangiers, petaurists, perameles, and phascelomes, possess the same formation, and it is well known that the entire order of insectivores or perching birds are principally distinguished by the same character. In no known instance, however, has it ever been observed to mark a sexual distinction.

1. The *Chimpanzée* (*P. troglodytes*, Linn.) is that species of ape usually placed next to man in the scale of animal existence; though Baron Cuvier has contested its right to occupy this rank in favour of the orang-outang. M. Cuvier's preference of the latter species arises simply from the greater development of the region of the brain, and the comparative height of the forehead, as exhibited in the very young individuals usually brought to this country; but it is to be observed, that these marks of superior mental powers are completely obliterated in the adult animal; and that, in other respects, both the organic structure and intellectual capacity of the chimpanzée appear to be of a higher order than those of the orang-outang. The African species, for instance, has nearly the same proportion between the anterior and posterior extremities that is exhibited in mankind; nor has it the deformed neck and high shoulders of its Indian congener. These circumstances probably produce a greater facility of walking upright, as this species is commonly reported to do, and which is greatly impeded, by the long and disproportionate arms of the orang-outang. But no adult specimens of these animals have ever been brought alive to Europe; they are very seldom met with even in their native forests; and we are not aware that the full grown chimpanzée exists in any museum. Our information is, consequently, derived either from the observation of very young specimens, or from the reports of travellers often detailed at second hand, and, therefore, to be admitted with caution.

The head of the chimpanzée, even in the young individual, is flattened above, with a retiring forehead and a prominent bony ridge or crest over the eyebrows. In this respect it is certainly inferior to the young orang-outang, which exhibits a remarkable elevation of forehead, and a rotundity of the

[The Chimpanzée.]

cranium much greater than even in the human infant, but its mental capacity does not correspond with these external appearances, and the great development of the face and muzzle degrade it to a close approximation with the lower animals. The face of the chimpanzée, on the contrary, is not relatively more prolonged in proportion to the capacity of the cranium, than that of the human subject; the proportions of its different parts also more closely assimilate it to the human face, and the mouth, even in the adult animal, appears to want the enormous canine teeth which characterize the Indian species. The mouth itself is wide, the ears remarkably large, the nose flat, and the arms and legs in about the same proportion as in man; the fore-fingers not quite touching the knees when the animal stands upright. In the orang-outang they nearly touch the ground, in similar circumstances, and the ears of the latter species are remarkable for their very small size and deformed appearance. The body of the chimpanzée is covered with long, coarse, black hair, thickest on the head, shoulders, and back, but thinly furnished on the breast and belly; the face is of a dark brown colour, and, like the ears, naked; the cheeks, however, are furnished with long black whiskers. Finally, the hair on the fore-arms is long and directed back towards the elbows, meeting that of the arms which is directed downwards in the usual manner, and forming a small ruff about the joint.

African travellers assure us that the adult chimpanzée attains the ordinary stature of man, and is endowed with a degree of intelligence much superior to other quadrumania. It inhabits the countries from Sierra Leone to the southern confines of Angola, perhaps even from the Gambia to Cape Negro. Chimpanzée is said to be its name about Sierra Leone, but further south it is called smitten and pongo, according to Battel and Bosman. Buffon and his copiers have strangely confounded the habits, and even the external form and description of the mandril, a large species of baboon inhabiting the same countries, and called mandril, barris, &c., by the natives, with those of the chimpanzée. It is of importance to bear this circumstance in mind, in reading common works on natural history, as nothing is more productive of error than the confusion thus introduced into the history of individual

species, by forming a purely fictitious being, out of two or more really natural animals. Linnæus upon this, as on all other subjects, judged with greater accuracy than Buffon; yet the great author of the *Système Naturel*, with all the profound knowledge, acuteness, and calm unbiassed spirit of inquiry by which he was so eminently distinguished, long hesitated whether to consider the chimpanzee as a second species of the genus *homo*, or the first among the apes. It was only, indeed, in his last edition that Linnæus finally adopted the latter opinion, and learned to consider this extraordinary animal as generically distinct from man himself. That the stories of the pygmies, cynocephali, and other strange and deformed people, supposed by the ancients to inhabit different parts of Africa, arose from vague reports of different species of apes and monkeys, appears to be highly probable; but the term *Troglodytes*, which some authors have supposed to refer to the animal at present under consideration, denoted in reality a race of barbarians, as is well known to those who interest themselves in ancient geography. [See *TROGLODYTES*.]

All travellers agree in assuring us, that, in a state of nature, the adult chimpanzees live in society in the woods, where they construct huts to protect themselves against the sun and the tropical rains, by intertwining the leaves and branches of trees; that they walk upright, arm themselves with clubs, and unite to defend themselves against the attacks of wild beasts, compelling the elephant himself to abandon the districts in which they reside. It is dangerous for men to enter these forests, unless in companies and well armed; women, in particular, are often said to be carried away by these animals, and one negress is reported to have lived among them for the space of three years, during which time they treated her with uniform kindness, but always prevented any attempt on her part to escape. When the negroes leave a fire in the woods, it is said that the chimpanzees will gather round and warm themselves at the blaze, but they have not sufficient intelligence to keep it alive by fresh supplies of fuel.

The chimpanzees generally brought to Europe, and whose manners have been observed by naturalists, were all of immature age. A specimen exhibited some years ago at the Egyptian Hall, Piccadilly, in company with a young orang-outang of about the same age, afforded a very favourable opportunity for comparing the form and habits of these two animals. The chimpanzee, though in a declining state of health, and rendered peevish and irritable by bodily suffering, exhibited much superior marks of intelligence to his companion: he was active, quick, and observant of everything that passed around him; no new visitor entered the apartment in which he was kept, and no old one left it, without attracting his attention. The orang-outang, on the contrary, exhibited a melancholy and a disregard of passing occurrences almost amounting to apathy; and though in the enjoyment of better health, was evidently much inferior to her companion in quickness and observation. On one occasion, when these animals were dining off potatoes and boiled chicken, and surrounded as usual with a large party of visitors, the orang-outang allowed her plate to be taken away, without exhibiting the least apparent concern: not so, however, the chimpanzee; we took advantage of an opportunity, whilst his head was turned to observe a person coming in, to secrete his plate also: for a few seconds he looked round to see what had become of it, but not finding it, began to pout and fret exactly like a spoiled child, and perceiving a young lady, who happened to be standing near him laughing, or, perhaps, suspecting her to be the delinquent, he flew at her in the greatest rage, and would have probably bitten her had she not got beyond his reach. Upon having his plate restored, he took care to prevent the repetition of the joke by holding it firmly with one hand, while he fed himself with the other.

2. The *Orang-Outang* (*P. Satyrus*, Lin.), the most celebrated of all the apes, is a native of the most remote and unfrequented forests in the interior of Borneo, Java, and Sumatra; perhaps also of the southern provinces of China and the Malayan Peninsula, but the authorities upon which these latter habitats rest, are by no means unquestionable. Though exhibiting in early youth a rotundity of the cranium and a height of forehead altogether peculiar, and accompanied, at the same time, with a gentleness of disposition and gravity of manners which contrast strongly with the petulant and irascible temper of the lower orders of quadrumanous mammals, the orang-outang in its adult state

Orang Outang.

is even remarkable for the flatness of its retiring forehead, the great development of the superorbital and occipital crests, the prominence of its jaws, the remarkable size of its canine teeth, and the whole form of the skull, which from the globular shape of the human head, as it appears in the young specimen, assumes all the form and characters belonging to that of a large carnivorous animal. The extraordinary contrasts thus presented in the form of the skull, at different epochs of the same animal's life, were long considered as the characters of distinct species; nor was it till intermediate forms were obtained, exhibiting in some degree the peculiarities of both extremes, that they were finally recognised as distinguishing different periods of growth only.

These characters of the adult animal, as well as the disproportionate length of the arms, the short, thick neck, deformed by two large membranous sacks, which give a peculiarly shrill and hollow tone to the animal's voice, and other details of its general organization, debase the orang-outang in the scale of existence when compared with the chimpanzee. The great length of the arms is certainly the most striking peculiarity about this animal, more particularly when compared with the shortness of the body and legs: when standing perfectly upright, the fingers can almost touch the ground, and hence it arises that the biped station is by no means so convenient, for this species as for the chimpanzee. It is seldom, therefore, that the orang-outang attempts to walk on the hind feet alone; but when it does, the hands are invariably employed for the purpose of steadying its tottering equilibrium, touching the ground lightly on each side as it proceeds, and by this means recovering the lost balance of the body. Like the chimpanzee, this species is destitute of callosities: the muzzle is considerably prolonged, the mouth large and ill-formed, the lips thin and protuberant, the chin almost wanting, the ears remarkably small, and the nose so flat as to be recognised only by the nostrils. The face, ears, and hands are naked, and of a reddish brick colour; the fore parts of the body also are but thinly covered with hair; but the head, shoulders, back, and extremities are very thickly clothed with long hair of a dark vinous red colour, directed forwards on the crown of the head, and upwards towards the elbows, on the fore arms. The nails of the hind thumbs are sometimes wanting in young individuals of this

species, but the character is by no means general, much less universal, nor is it a specific distinction, as some writers would have us believe.

The relations which Europeans have maintained with India, ever since the end of the fifteenth century, have afforded frequent opportunities for observing this animal, and many young specimens have been at different times introduced into England, Holland, France, and Portugal. In youth it is principally remarkable for its gentle and affectionate disposition, but the cold and moist character of our northern climates always prevents the development of its faculties, and terminates its life in a very few months. The following account of the habits and manners of a specimen, observed by Dr. Clarke Abel in Java, exhibits the animal in more favourable, because more natural, circumstances. 'Whilst in Java,' says Dr. Abel, 'he lodged in a large tamarind tree near my dwelling, and formed a bed by intertwining the small branches and covering them with leaves. During the day, he would be with his head projecting beyond his nest, watching whoever might pass under, and when he saw any one with fruit, would descend to obtain a share of it. He always retired for the night at sun-set, or sooner if he had been well fed; and rose with the sun and visited those from whom he habitually received food. On board ship he commonly slept at the mast-head, after wrapping himself up in a sail. Sometimes I pre-occupied his bed, and teased him by refusing to give it up. On these occasions, he would endeavour to pull the sail from under me, or force me to quit it, and would not rest till I had resigned it. If all the sails happened to be set, he would hunt about for some other covering, and either steal one of the sailors' jackets, or empty a hammock of its blankets. His favourite amusement in Java was in swinging from the branches of trees, or gliding over the roofs of houses; on board, in hanging by the ropes, or romping with the boys of the ship. He would entice them to play by striking them with his hand as they passed, and then bounding from them, but allowing them to overtake him and engage in a mock scuffle. Of some small monkeys on board he took little notice whilst under the observation of the persons of the ship. Once, indeed, he openly attempted to throw a small cage containing three of them overboard; but I had reason to believe that he was not so indifferent to their society when free from observation. On one occasion I observed him, lying on his back, partially covered with a sail, contemplating with great gravity the gambols of a young monkey which was bounding over him: at length, he caught him by the tail and tried to envelope him in his covering. The monkey seemed to dislike the confinement, and broke from him, but again renewed its gambols, and though frequently caught, always escaped. The intercourse, however, did not seem to be that of equals, for the orang-outang never condescended to romp with the monkeys as he did with the boys of the ship. Yet the monkeys had evidently a great predilection for his company, for whenever they broke loose, they took their way to his resting-place.

'But though so gentle when not exceedingly irritated, the orang-outang could be excited to violent rage, and on one or two occasions committed an act which, in a rational being, would have been called the threatening of suicide. If repeatedly refused an orange when he attempted to take it, he would shriek violently, and swing furiously about the ropes, then return and endeavour to obtain it: if again refused, he would roll for some time like an angry child upon the deck, uttering the most piercing screams, and then, suddenly starting up, rush furiously over the side of the ship and disappear. On first witnessing this act, we thought that he had thrown himself into the sea; but, on searching, found him concealed under the chains.'

It is very seldom that the adult orang-outang has come under the observation of Europeans. An interesting paper, relative to the capture of an individual seven feet high, likewise from the pen of Dr. Clarke Abel, is contained in the fifteenth volume of the *Asiatic Researches*. This animal was discovered by the company of a merchant ship, at a place called Ramboon, on the north-west coast of Sumatra, on a spot where there were but few trees or much cultivated ground. It was evident that he had come from a distance, for his legs were covered with mud up to the knees, and the natives were unacquainted with him. On the approach of the boat's crew, he came down from the tree in which he was discovered, and made for a clump at some distance, exhibiting, as he moved, the appearance of a tall man-like

figure, covered with shining brown hair, walking erect with a waddling gait, but sometimes accelerating his motion with his hands, and occasionally impelling himself forward by the bough of a tree. His motion on the ground was evidently not his natural mode of progression, for even when assisted by his hands or a stick it was slow and vacillating; it was necessary to see him amongst the trees to estimate his strength and agility. 'On being driven to a small clump,' says Dr. Abel, 'he gained by one spring a very lofty branch, and bounded from one branch to another with the swiftness of a common monkey, his progress being as rapid as that of a swift horse. After receiving five balls, his exertions relaxed, and reclining exhausted against a branch, he vomited a quantity of blood. The ammunition of the hunters being by this time exhausted, they were obliged to fell the tree in order to obtain him, but what was their surprise, to see him, as the tree was falling, effect his retreat to another, with seemingly undiminished vigour! In fact, they were compelled to cut down all the trees before they could force him to combat his enemies on the ground, and when finally overpowered by numbers, and nearly in a dying state, he seized a spear made of a supple wood, which would have withstood the strength of the stoutest man, and broke it like a reed. It was stated by those who aided in his death, that the human-like expression of his countenance, and his piteous manner of placing his hands over his wounds, distressed their feelings so as almost to make them question the nature of the act they were committing. He was seven feet high, with a broad expanded chest, and narrow waist. His chin was fringed with a beard that curled neatly on each side, and formed an ornamental rather than a frightful appendage to his visage. His arms were long even in proportion to his height, but his legs were much shorter. Upon the whole,' adds his biographer, 'he was a wonderful beast to behold, and there was more about him to excite amazement than fear. His hair was smooth and glossy, and his whole appearance showed him to be in the full vigour of youth and strength.'

[The Siamese.]

3. The *Siamese* (*P. syndactylus*, Raffles) is an interesting species of ape discovered in Sumatra by the combined researches of the late Sir Stamford Raffles, and the French naturalists, Duard and Duvaucelle. It is the largest of the subdivision of gibbons, or apes distinguished by the possession of small rudimentary callosities, and in this respect, as well as in its intellectual acquirements, is considerably inferior in the scale of natural beings to the chimpanzee and orang-outang. Its skull is small and depressed; its

face naked and black, a few red hairs only marking the forehead and chin; the eyes deeply sunk under large projecting brows; the nose broad and flat, with wide open nostrils; the mouth opens almost to the articulation of the jaws; the cheeks are sunk under high cheek-bones, and the chin almost rudimentary. The hair over the whole body is extremely thick, long, and of a glossy black colour, much closer on the shoulders, back, and limbs, than on the belly, which, particularly in the females, is nearly naked. The scrotum of the males, also, is furnished with a tuft of very long straight hair, which descends to the knee, and readily distinguishes this sex from the females, which, on the other hand, are easily recognised by their naked breasts and bellies, and prominent mammae terminated by large nipples. The ears are entirely concealed by the hair of the head; they are naked, and, like all the other naked parts, of a deep black colour. Beneath the chin there is a large bare sack, of a lax and oily appearance, which is distended with air when the animal cries, and in that state resembles an enormous goitre. It is in all respects similar to that already described in the orang outang, and undoubtedly assists in swelling the volume of the voice, and producing those astounding cries, which, according to M. Duvaucelle's account, may be heard at the distance of several miles.

Nor is this the only point in which these two species resemble one another. The siamang, like the orang outang, has the hair of the head directed forwards so as to shade the forehead, as in the human species, and that of the fore-arm directed upwards towards the elbow; where, encountering the hair of the humerus, which grows in the contrary direction, it forms a prominent ruff. But the most extraordinary part of the organization of this species, consists in the union of the index and middle fingers of the posterior extremities, from which it derives its specific appellation of *syndactylus*, and which, being connected together as far as the nail joint, are altogether destitute of separate or individual motion.

The habits and character of the siamang are so vividly painted by M. Duvaucelle, from observations made upon this animal in his native forests of Sumatra, that we cannot do better than translate his account as communicated in a letter to M. F. Cuvier. 'This species,' says M. Duvaucelle, 'is very common in our forests (those, namely, in the neighbourhood of Bencoolen, in Sumatra), and I have had frequent opportunities of observing it as well in its wild state, as in bondage. The siamangs generally assemble in numerous troops, conducted, it is said, by a chief, whom the Malays believe to be invulnerable, probably because he is more agile, powerful, and difficult to attain than the rest. Thus united, they salute the rising and the setting sun with the most terrific cries, which may be heard at the distance of many miles, and which, when near, stun, when they do not frighten: this is the morning call of the mountain Malays, but to the inhabitants of the town, who are unaccustomed to it, it is a most insupportable annoyance. By way of compensation, they keep a profound silence during the day, unless when interrupted in their repose or their sleep. These animals are slow and heavy in their gait; they want confidence when they climb, and agility when they leap, so that they may be easily caught, when they can be surprised. But nature, in depriving them of the means of readily escaping danger, has endowed them with a vigilance which rarely fails them; and if they hear a noise which is unknown to them, even at the distance of a mile, fright seizes them, and they immediately take flight. When surprised on the ground, however, they may be captured without resistance, either overwhelmed with fear, or conscious of their weakness and the impossibility of escaping. At first, indeed, they endeavour to avoid their pursuers by flight, and it is then that their mal address in this exercise becomes most apparent. Their body, too tall and heavy for their short slender thighs, inclines forward, and availing themselves of their long arms as crutches, they thus advance by jerks, which resemble the hobbling of a lame man, whom fear compels to make an extraordinary effort.

However numerous the troop may be, if one is wounded it is immediately abandoned by the rest, unless indeed it happen to be a young one; then the mother, who either carries it, or follows close behind, stops, falls with it, and uttering the most frightful cries, precipitates herself upon the common enemy with open mouth and arms extended. But it is manifest that these animals are not made for combat; they neither know how to deal nor to shun a blow. Nor is their maternal affection displayed only in moments

of danger: the care which the females bestow upon their offspring is so tender, and even refined, that one would be almost tempted to attribute the sentiment to a rational rather than an instinctive process. It is a curious and interesting spectacle, which a little precaution has sometimes enabled me to witness, to see these females carry their young to the river, wash their faces in spite of their outcries, wipe and dry them, and altogether bestow upon their cleanliness, a time and attention that, in many cases, the children of our own species might well envy. The Malays related a fact to me, which I doubted at first, but which I believe to be in a great measure confirmed by my own subsequent observations: it is, that the young siamangs, whilst yet too weak to go alone, are always carried by individuals of their own sex, by their fathers if they are males, and by their mothers if females. I have also been assured that these animals frequently become the prey of the tiger, from the same species of fascination which serpents are related to exercise over birds, squirrels, and other small animals.

Servitude, however long, seems to have no effect in modifying the characteristic defects of this ape, his stupidity, his sluggishness, and his awkwardness. It is true, that a few days suffice to make him as gentle and contented, as he was before wild and distrustful; but, constitutionally timid, he never acquires the familiarity of other apes, and even his submission appears to be rather the result of extreme apathy, than of any degree of confidence or affection. He is almost equally insensible to good or bad treatment; gratitude and revenge are sentiments equally strange to him. All his senses are dull and imperfect; if he regards an object, it is manifestly without any intention—if he touches it, it is involuntarily. In a word, the siamang exhibits an absence of all intellectual faculty: and if animals were to be classed according to their mental capacities, he would certainly occupy a very inferior station. Most commonly squatted on his haunchs, with his long arms twined round him, and his head concealed between his legs, a position which he also occupies whilst sleeping, he is seldom roused from his lethargy, nor does he break silence, unless at intervals to utter a disagreeable cry, which in sound approaches to that of a turkey cock, but which appears to be expressive of no sentiment, nor to declare any want, and which in reality expresses nothing: hunger itself is insufficient to excite, or divest him of his natural lethargy; he takes his food with indifference, carries it to his mouth without avidity, and sees himself deprived of it without testifying either surprise or resentment.

4. The *Wauwon* (*P. agilis*, F. Cuv.) has a bluish black face, slightly tinged with brown in the female: the eyes are approximated, and deeply sunk in the head, owing to the prominent brows which surmount them; there is scarcely any forehead; the nose is not altogether so flat as in the siamang, and the nostrils open by large lateral slits; the chin is provided with a few hairs by way of beard, and the ears are almost concealed by long white whiskers, which, uniting into a narrow band, cross the forehead immediately over the eyebrows. It is difficult to give a precise idea of the colours of this animal, particularly as they are liable to considerable variation on account of age and sex. The fur itself is of a softer and more woolly quality than in the other species: it is of a very dark brown colour on the head, breast, belly, and inner surface of the arms and thighs, becomes insensibly lighter on the neck and shoulders, and finally assumes a blond hue almost white, on the loins and hips. The posterior face of the thighs is a mixture of brown, white, and red; and the backs of the hands and feet are very dark brown, like the belly. The female is not so hairy in front as the male, her eyebrows are less prominent, and her whiskers smaller. The young are of a uniform straw colour. It is likewise to M. Duvaucelle that we are indebted for the knowledge of this species, and for the only account which we possess of its habits and economy. It inhabits the same countries and localities as the siamang, but is less frequently seen, as its surprising agility enables it easily to elude observation or escape pursuit.

'These apes,' says M. Duvaucelle, 'which live more frequently isolated in couples than in families, are the most rare of the genus found in the neighbourhood of Bencoolen. Very different from the siamang in its surprising agility, the wauwon escapes like a bird, and like it can only be shot flying; scarcely has it perceived the appearance of danger, when it is already far distant. Climbing rapidly to the tops of the trees, it then seizes the most flexible branches, and

balancing itself two or three times to secure its equipoise, it thus springs successively, without effort as without fatigue, to the distance of forty feet and upwards. As a domestic animal, the wouwou exhibits no extraordinary faculty. It is less comely than the siamang, its movements are more prompt and graceful, but its manners are less lively than those of the monkey tribes in general: looking merely upon the extent of its long slender arms and short handy legs, one could be far from supposing that its muscles were so

lively: so surprising. Nature, however, has not bestowed upon it a large portion of intelligence; in this particular it is in no way superior to the siamang: both species are equally deprived of that high and expanded forehead, which indicates superior intellectual powers, and this is one of the principal points of coincidence between them. What I have myself seen, however, convinces me that the wouwou is susceptible of a certain education: it has not the unperturbable apathy of the siamang: it may be frightened or pleased: it flies from danger, and is sensible of good treatment: it is gluttonous, curious, familiar, and sometimes even gay. Though deprived of the guttural sack so remarkable in the siamang, its cry is very nearly the same: so that it would appear that this organ does not produce the effect of increasing the sound usually attributed to it, or else, that it must be replaced in the wouwou by some analogous formation.

The height of the adult wouwou, measured from the sole of the foot to the crown of the head, is two feet seven or eight inches: when standing in an upright posture, its forearms nearly touch the ground: the thumbs of the hands are very short, but those of the feet are long in proportion, and capable of being completely opposed to the other toes: it has small naked callosities, is entirely destitute of tail and cheek pouches, and in other respects perfectly resembles the common apes of the gibbon family. The female is rather smaller than the male: it is known by different names in Sumatra: that of wouwou is the most common, and is meant to imitate the voice of the animal.

5. The *Ounko* (*P. Rafflesi*, Geoff.) is another species discovered, like the siamang and wouwou, during the expedition of Sir Stamford Raffles and MM. Diard and Duvaucelle into the unexplored forests of the interior of Sumatra, and named by M. Geoffroy St. Hilaire, after the first of these distinguished zoologists. This animal, which is called ounko by the Malays of Padang, appears to be of very rare occurrence: since, during fifteen months' residence on the island, the French naturalists above named never had reason to suspect its existence, though they had penetrated the woods in all directions for the express purpose of investigating its zoology. It was only a short time previous to their departure that they made the discovery; and as they enjoyed no opportunity of studying its manners, we are, consequently, deprived of those interesting details which have been furnished regarding the habits and economy of the species last described.

The size of the ounko is a little less than that of the wouwou, to which it bears so close a resemblance in form and proportion, that these two species are only to be distinguished by the difference of their colours. That of the ounko is a general black, less deep and brilliant indeed than that of the siamang, and in some degree resembling the fur of the wouwou in its length and thickness, and in the brown shade which it assumes in certain lights, particularly on the limbs, which are a uniform dark brown.

It resembles the latter animal by its large white whiskers, uniting to form a scanty white beard under the chin, and by a narrow band of the same colour across the forehead. The throat is not naked and dilatate as in the siamang, but only more sparingly furnished with short hair than the breast and belly, and the scrotum is provided with a long pendulous tuft of hair, tipped with red, and hanging down nearly to the knee. The female, according to M. Duvaucelle, has the index and middle fingers of the posterior extremities united as in the siamang; and upon dissection it was found that this animal had fourteen pairs of ribs, being one more than in the other species. 'Thus,' says M. Duvaucelle, 'the ounko bears a close resemblance to the siamang in the nature and colour of its fur, and to the wouwou in its white eyebrows and whiskers, its physiognomy and general proportions, in the absence of the guttural sack, and in the union of the index and middle-finger on the hind hands of the female only.' This sex further differs from the male by its smaller stature and the absence of the

which no further trace remains than two light brown marks over the eyes. With this exception the head is uniformly black: the breast and belly have very little hair, but that of the back and shoulders is extremely long and thick, and forms a kind of mane, of which some traces likewise exist, though in a smaller degree, in the siamang and wouwou. The hair of the fore-arm in both sexes, to judge at least from the lithographic plates of M. F. Cuvier, is reversed, as in the siamang and orang outang: whilst in the wouwou, it is directed towards the wrist as in ordinary mammals.

6. The *gibbon* (*P. lar*, Lin.), originally described by Buffon and Daubenton, and confounded by Sir Stamford Raffles (in his Catalogue of Sumatran Animals, inserted in the 13th volume of the *Transactions of the Linnean Society*) with the ounko, is, however, a very distinct species, and differs not only in its external characters, but likewise in its internal conformation. It is indeed true that these two species resemble one another in the quality and general colour of their hair, and in the white circle which more or less surrounds the face of both, but the hands and feet of the ounko are black, like the rest of the body, whilst in the gibbon they are light grey, and form a striking contrast with the colour of the other parts: the hair of the fore-arm, likewise, is reversed in the former species, and directed in the usual manner towards the wrist in the latter; at least such is the direction given to it in the engraving of Buffon, and there is nothing said to the contrary either in his description, or in that of the accurate Daubenton, whose notice it could not possibly fail to have attracted, had it existed in his specimen: the index and middle hand toes are separate in the female gibbon, whilst in the ounko they are united (always presuming that M. Duvaucelle's specimens were really the male and female of the same species, of which there is good reason to doubt); and, finally, there are but twelve pairs of ribs in the gibbon, and fourteen in the ounko, as demonstrated by the dissections of Daubenton and Duvaucelle respectively.

The gibbon observed by Buffon was, like the generality of its congeners, of a gentle, affectionate disposition, and quiet and deliberate in all its movements: it was fearful of cold and damp weather, and received the bread, fruit, and other eatables which its visitors presented to it, with a gentleness very different from the abrupt and eager manners of the monkeys and baboons. It was brought from the Indian Archipelago.

7. The *Pithecius leuciscus* of Geoffroy, also called wouwou by the Malays, is a species of which we have at present but an imperfect knowledge. It closely resembles the *P. agilis*, but is of a uniform ashy-grey colour, with a black, naked face: arms still longer than in that species, and much larger callosities. Its hair is of a softer and more furry quality than in the other apes, and its face is surrounded by a circle of light grey, the ears, hands, feet, and top of the head being very dark brown. Professor Cowper, who describes this animal, obtained his specimen from the Molucca Islands, where the species is often seen swinging itself among the long slender branches of the lamboos. It is said often to walk upright: its habits are active, and its disposition irritable and passionate.

APPELLEANS. [See HERETICS.]

APELLES, one of the most celebrated Greek painters, is generally considered to have been a native of the little island of Cos in the Egean sea. Nearly all that we know about him, with the exception of some few scattered notices, is contained in the 10th chap. and the 35th book of Pliny's *Natural History*. The time of his birth is not fixed, but we are told that he was at the height of his reputation in OI. cxii., or about B.C. 332: and as he painted a great many portraits of Philip, the father of Alexander, he could not be a very young man in B.C. 336, the time of Philip's death. He also survived Alexander, who died B.C. 323.

His chief master was Pamphilus, a Macedonian, and a distinguished artist, whose fee was very high. Apelles received instruction from him at Sicyon, a city which for some time before and after this date had a high reputation as a school both of sculpture and painting. Of his earliest essays we know nothing: but we are told that his diligence was unwearied, and that he never passed a day without doing something: 'ut non linam duendo exerceret artem.' Winkelmann interprets these words to mean, 'that he never passed a day without trying to improve himself as a draughtsman,' a sense which the words will not bear. The story of his first acquaintance with

Protagenes the Rhodian painter, as told by Pliny, is creditable to the character of both artists: indeed Apelles is much praised for the frankness and plain-dealing of his character. Another story is told of Apelles as having given rise to the well known saying, that a shoemaker should not go beyond his last. Apelles placed a picture which he had finished in a public place, and concealed himself behind it in order to hear the criticisms of the passers-by. A shoemaker observed a defect in the shoe, and the painter forthwith corrected it. The cobbler came again the next day, and being somewhat encouraged by the success of his first remark, began to extend his censure to the leg of the figure, when the angry painter thrust out his head from behind the picture and told the shoemaker to keep to his trade.

Apelles excelled in grace and beauty. The painter, who laboured incessantly, as we have seen, to improve his skill in drawing, probably trusted as much to that branch of his art as to his colouring: he only used four colours, as we are told (Phryg.). His favourite subject was the representation of Venus, the goddess of Love, the female blooming in eternal beauty: and the religious system of the age favoured the taste of the painter. His great picture of Venus, which he had undertaken for the island of Cos, was left unfinished at his death. Another, the Venus Anadyomene, representing the goddess rising from the waves of the sea, was taken to Rome, and placed by the Emperor Augustus in the temple dedicated to Julius Caesar the Dictator. The lower part was injured, and nobody could be found to restore it: but the Emperor Nero, who had a taste for art, finding that the whole picture was going to decay, had it copied by Dioscorides.

Apelles painted many portraits of Alexander the Great, who, we are told, often visited his painting room, and would not sit to any body else. But it is not very easy to reconcile Alexander's rambling life with this account, unless we suppose that Apelles followed him into Asia: a story altogether improbable, if we read the account of the revelries at Susa after Alexander's return from India, and of the number of all kinds of professional artists then assembled to add to the splendour of the festival. (See Athenæus, xii. p. 538; where Chares seems to refer these festivities to a wrong period: and ALEXANDER.) The Macedonian king is even said to have made Apelles a present of Campaspe, a beautiful female, whose graces the painter transferred to his Venus Anadyomene. According to Athenæus (xiii. p. 590, Casaub.), the painter made the beautiful Phryne his model, as she was bathing in the sea at Eleusis.

Apelles painted a portrait of King Antigonus (see his medal), which he placed in profile to hide the defect of the want of one eye. We may form some idea of the state of art in that day by the medal of Antigonus which we have, and by the fame of Apelles which has survived his works; it is not an unlikely hypothesis, that the figure of Antigonus on his coins would be in harmony with his portrait by Apelles.

The great picture of Alexander by Apelles was in the temple of Diana at Ephesus: other pictures by Apelles were in Samos and Rhodes, and Rome contained several in the time of Pliny. A Hercules in the temple of Antonia [see ANTONIA] was attributed to him. Apelles published a work on painting, which unfortunately is lost. He was accustomed to use a varnish for his pictures, which brought out the colours, and preserved them at the same time. The date of his death is unknown.

A story told by Lucian, in his little piece *Ἡοὶ τὸ πρῶτον πρὸς τὴν ἀπολογία*, belongs to another Apelles, of Ephesus. (See Pliny; Winkelmann, vol. ii., &c.)

APELICON, a personage principally memorable for his connexion with the preservation of the works of Aristotle. According to Strabo (book xiii., p. 608, &c. Casaub.), he was a native of Teos, but went to Athens, and was admitted a citizen of that state. He was very rich, and his vanity seems to have led him to seek distinction by the assumption of the literary character. He spared no expense in amassing books; but Strabo says that he was rather φιλόβιβλος (a lover of books) than φιλοσόφος (a lover of wisdom). Among other libraries which he purchased was that which had been collected by Aristotle more than two hundred years before: and which, enriched as it was by the manuscripts of that philosopher himself, and of his pupil Theophrastus, had, according to the improbable story, been long altogether concealed from the world. It had been left, Strabo says, by Aristotle to Theophrastus, and by the latter to his disciple Neleus,

who carried it to his native town Scepsis, in the Troad. On his death it fell into the hands of his heirs: who, not being of a literary turn, and yet aware, probably from the instructions of Neleus, of the great value of the deposit, acted in a manner natural enough in such circumstances. To prevent the books from getting into the hands of the King of Pergamus, in whose dominion they resided, and who possibly might have removed them to the famous library of that capital without much regard to the rights of the owners, they concealed them in a cellar under ground. Here they remained until they were purchased by Apellicon from the descendants of the persons by whom they had been thus secured, about a century and a half afterwards. They had, however, suffered much from their long entombment, and the copyists whom Apellicon employed to transcribe them were not very well qualified to restore the passages which had been rendered illegible. When thus for the first time published, they consequently appeared in a very faulty state. When Sylla conquered Athens (86 B.C.) he carried to Rome, among other literary treasures, the library of Apellicon, who had just died: and this particular collection, Plutarch says, he retained as his own property. Tyrannion, the grammarian, who was a great admirer of Aristotle, contrived to ingratiate himself with Sylla's librarian, and obtained the privilege of using the manuscripts. Several publishers also of that day (βιβλιοπολῆται) employed bad copyists to make transcripts, and did not take care to have the copies collated with the originals: this, indeed, says Strabo, is a common

error in books which are copied for sale, both here (in Rome) and at Alexandria. It was not until Andronicus of Rhodes [see ANDRONICUS], who was an acquaintance of Tyrannion, undertook the task of correcting the writings and putting them in order, that they were given to the world in anything like a correct form. Athenæus (v., p. 211, Casaub.) informs us that Apellicon's passion for rare manuscripts made him very unscrupulous about the means of obtaining them, and that at length he was discovered to have got into his possession the originals of many of the ancient public decrees from the city archives, which so enraged the Athenians against him, that he was obliged to run away to save his life. The influence of his friends and his own wealth, however, soon obtained his return: and, having attached himself to the faction of the Peripatetic philosopher Athenion, whom the chances of civil confusion placed for a short time at the head of affairs, he was invested with the command of the island of Delos. In this situation he conducted himself with great incapacity: and the result was, that the Romans effected a descent upon the island, and, falling upon the garrison while they were asleep, put nearly all of them to the sword. Apellicon was fortunate enough to make his escape; and, having returned to Athens, he died there a short time before the capture of the city by Sylla. Athenæus says that Apellicon embraced the opinions of the Peripatetics; and a work of his, in defence of Aristotle, is quoted in a passage of another ancient writer preserved by Eusebius. (See Bayle, in articles Andronicus and Tyrannion, and the article ARISTOTLE.)

APENNINES, the general name for the great mountain-system of Italy. The origin and meaning of the name are lost, says Mannert, in the darkness of the early ages. But it is probable that the word contains the element *Pen*, signifying a head or high mountain: this word appears in the same sense in many parts of Europe that were once, or now are, inhabited by tribes of the Celtic family. The Greek historian Polybius speaks of ὁ Ἀπεννίνος, and also uses the name in the plural number: Livy and other Latin authors use *Montes Apennini*, in the singular; the geographer Strabo uses both the singular τὸ Ἀπεννίνον ὄρος, and the plural, τὰ Ἀπεννίνων ὄρη, from which probably comes the modern plural appellation: but the term *Montes Apennini*, and ὁ Ἀπεννίνος, or τὸ Ἀπεννίνον ὄρος, were applied, equally with the modern 'Apennines,' to the whole system of mountains from the Alps to the extremity of Calabria. (See Strabo, pp. 201, 259: Polyb. book ii.)

The great mountain boundary of Italy on the north and north-west terminates on the shores of the Mediterranean with that subdivision of the chain called the Maritime Alps. From Monte Viso, situated near the southern limit of the Cottian Alps, and the most conspicuous feature in that group, rising in a beautiful conical form to the height of 12,586 feet above the level of the sea, the Maritime Alps have a gradual fall to the coast. They also stretch westward nearly to Toulon, where they may be said to have a natural

termination by gradually sinking to a plain; but towards the east they have only an arbitrary line of demarcation, in the neighbourhood of Savona, where the Apennines commence, which may be considered as a prolongation of the great chain of the Alps. The north-western extremity of the Apennines is thus situated near the sources of the river Bormida, north of Finale, a small town on the coast between the Col de San Giacomo, the last of the conspicuous heights of the Maritime Alps, and the Col di Cadibona, the first mountain of the Apennines. From this point (about 41° 16' N. lat., 8° 18' E. long.) they stretch in a north-easterly direction until they reach the pass of the Bochetta, due north of Genoa; thence they continue to run eastward, and a little to the south, to the neighbourhood of Pontremoli, from which point they extend in a general south-east direction, but not without some deviations, through the peninsula, at a nearly equal distance from the coasts of the Adriatic and Mediterranean, to Capo di Leuca, on the eastern side of the Gulf of Taranto. From the centre of Calabria a branch extends nearly due south to Cape Spartivento, (37° 56' N. lat., 16° 5' E. long.) the farthest extremity of Italy: they consequently run through 6° 20' of latitude. The length of the chain is about 650 English miles in a direct line: but, including its windings, it is little short of 800 miles.

The general outline of the Apennines presents neither the vertical needles of the Alps, the sharp peaks of the Pyrenees, nor the long rocky cliffs or escarpments of the Jura mountains; their forms are smooth, rounded, and wavy, bare rocks scarcely ever appearing, except in the highest parts. The most elevated point is nearly in the centre of the chain, a little eastward of Aquila, where Monte Corno rises to the height of 9521 feet, an elevation, however, which is below the limit of perpetual snow in that climate. The great chain is usually divided into four principal groups, called the Ligurian, Etruscan, Roman, and Neapolitan Apennines.

1. The *Ligurian Apennines* encircle the Gulf of Genoa from the Maritime Alps to Monte Gisa, north of Pontremoli, at the source of the little river Magra, and from thence they stretch in a south-easterly direction as far as the borders of Tuscany. The length of this group is about 120 miles: the crest of the mountain chain is from seven to thirty miles distant from the Mediterranean, and from thirty to fifty miles from the Po. From their north-western extremity the elevation rather diminishes until they reach the pass of the Bochetta, but from this point there is a gradual rise, and in Monte Pellegrino, near the south-eastern extremity, they attain an elevation of 5161 feet: the breadth of the group increases with the height, but does not anywhere exceed twenty-five miles. The slope of the mountains toward the sea is abrupt, and is broken by numerous deep gullies, the beds of torrents, which rush down with prodigious violence when swollen by rains. On the Mediterranean side there are only two rivers with a moderate length of course, the Vara and the Magra, which, after uniting their waters, fall into the sea at the entrance of the Gulf of Spezia: but from the northern and eastern slope there are many considerable streams, all tributaries of the Po, the Bormida, Scrivia, Trebbia, Nura, Taro, Grosotto, and Secchia. The beds of all these rivers are sometimes filled with great torrents, at other times nearly dry, on account of the small quantity of snow which lies upon the mountains from which they are fed. The scenery of the Ligurian Apennines, particularly on the Mediterranean side, is of the most varied and beautiful description; and in the celebrated pass of the Bochetta, nothing can be more magnificent than the prospect on issuing from the wild mountain ravine, especially to those who there, for the first time, look upon the dark blue waters of the Mediterranean. The mountain barrier between the basin of the Po and the coasts of the Gulf of Genoa is traversed in several directions by great roads, constructed at a vast expense and with much skill. The most considerable of these are, 1. the road from Alessandria up the valley of the Bormida, by Acqui and Spigno, over the pass of Montenotte at an elevation of 4460 feet, to Savona. 2. That from Alessandria over the plain of Marengo, by Novi, Gavi, Voltaggio, and the Bochetta to Genoa. 3. From Parma by Fornovo, up the valley of the Taro, and over the pass de' Cento Croci to Pontremoli, and thence by the valley of the Magra to Aulla, Sarzana, and the Gulf of Spezia. The communication between the south of France and Italy is by the celebrated road

begun under Napoleon, called the *Corniche*, which runs along the sea coast from Nice by Oneglia, Savona, Genoa, Chiavari, and Massa, to Lephorn.

2. The *Etruscan Apennines* extend from Monte Pellegrino to Monte Cornaro, in 12° 3' E. long., and in a direct line between Florence and Fano, a distance of about 75 miles. In this group the mountain chain approaches nearest to the Adriatic, Monte Cornaro being about twenty-four miles from Rimini, on the Adriatic, and nearly a hundred from Orbitello on the west coast. The slope is rapid towards the Adriatic in the southern part of the group, but in the northern part there is a gradual fall to the marshes of the lower Po and the sandy plains which stretch from thence southward along the coast. On the western side, the mountains throw out numerous branches and fall gradually towards the Mediterranean, sinking southward into the low marshy country of the Maremma. The highest points of the group are, Monte Cimone, 6975 feet, and Monte Amiata, west of Radicofani, 5791 feet above the level of the sea. From the summit of the former, which is a little to the west of a direct line between Modena and Pistoja, there is a most extensive prospect: on one side the vast plain of Lombardy, including the territories of Parma, Reggio, Modena, and part of Romagna, with the Adriatic in the distance; on the other side, a great part of Tuscany, showing the whole course of the Arno to its embouchure in the Mediterranean, which terminates the view. On the eastern side of this group there are numerous streams, but none of great importance; on the western side are the sources of the Tiber, and the Arno which, though much less than the Tiber, becomes a considerable stream by the waters which it receives from these mountains. The communication between Lombardy and Florence is by two great roads over the Apennines, the one from Genoa by Pavullo, Pieve-Pelago, on the west side of Monte Cimone, through the pass of Finalbo, by Pistoja; the other from Bologna by Lojano, through the pass of Pietra Mala, at an elevation of 3284 feet.

3. The *Roman Apennines* run nearly through the centre of the peninsula, from Monte Cornaro to Monte Velino, which is almost due east of Rome, a distance of about 145 miles. In this group are the two most lofty points of the whole chain of the Apennines; they are situated not far from each other, in Abruzzo Ulteriore; the one, called Il Gran Sasso d'Italia, of which the summit, Monte Corno, is 9521 feet above the sea; the other, Monte Velino, is 8183 feet high. Besides these, there are three other mountains of great height; namely, Monte Vettore, 8135 feet, Monte Sibilla, near Ascoli, antiently Mons Tetricus, 7212 feet, and Il Terminillo Grande, north of Rieti, 7934. These are all covered with snow the greater part of the year, for snow falls sometimes in May and September. Between Monte Sibilla and Monte Velino, several branches are thrown off towards the Adriatic on one side, and towards the Mediterranean on the other, the latter having a south-west direction, and one of them accompanying the lower course of the Tiber, as far as the plains near Rome.

4. The *Neapolitan Apennines* include all that part of the mountain system of Italy which extends from Monte Velino to the two extremities of the Terra di Otranto and Calabria, Cape Leuca, and Cape Spartivento, and which no longer forms one great range, but rather a diverging group of subordinate chains. The highest point, towards their northern extremity, is Monte Miletto, in the eastern part of the Terra di Lavoro, the antient Samnium, east of Venafrum, and north of Capua. It is 6744 feet high, and in the valleys of Matese, near its summit, snow is found nearly the whole year. From Monte Chilone, west of Troja, a great branch is thrown off from the central chain, in a north-easterly direction, through the Capitanata, which, turning eastward, runs out to the promontory of Garganum, *Mons Garganus* in Apulia. It rises in several places into considerable elevations, the most conspicuous of which are Monte Calvo, 5295 feet high, and Monte Gargano, which is nearly as much. Another great branch is thrown off not far from Venosa, *Venusia*, and stretches south-east, through the districts of Bari and Otranto, and with a gradually diminishing fall terminates in the low hills between the towns of Gallipoli and Otranto. From the neighbourhood of Venosa the mountains also take a western direction, bending a little to the south, and terminating in Cape Campanella opposite the rocky island of Capri; thus

from Cape Campanella to Cape Leuca the mountains form a continuous curvilinear boundary between the northern parts and the southern portion of this great peninsula. The main chain of the Apennines stretches from the neighbourhood of Venosa to the extremity of Calabria, and rises in many places into mountains of great height. The most lofty of these, Il Pollino, is on the southern limit of the province of Basilicata, (about 40° N. lat.) and is 7076 feet high; patches of snow may be seen upon it even in July. The other lofty mountains of Calabria are, Monte Sivo in Basilicata, 6000 feet; La Sila, east of Cosenza, 4935 feet; and Monte Alto, the highest point of Monte Aspro, east of the straits of Messina, 4380 feet.

Geological Structure.—A kind of conventional boundary has been laid down between the Alps and the Apennines, but it is impossible to draw any line of separation from difference of geological constitution; there is too great a blending and interlacing of formations of different ages, to enable us to say where one system of mountains ends, and the other begins. According to Signor Pareto of Genoa, who has examined the Northern Apennines with more care than any other geologist, there are three great deposits to which the various stratified rocks of Liguria, that are older than the tertiary, may be referred. The lowest is an assemblage of gneiss, mica-slate, clay-slate, talc-slate, and a semi-granular limestone: the next, an assemblage of argillaceous slates, marly sandstones, and slates, sandstones, and limestones; and the uppermost consist of a series of marly limestones, and a sandstone called *marigno*, with impressions of marine plants. These strata, together with some partial deposits of puddingstone, are all more or less inclined, sometimes nearly vertical, and frequently much contorted, particularly the uppermost strata. Upon these are found deposits of tertiary formation, usually in horizontal stratification; but they occur only in detached spots of limited extent, on the Mediterranean side of the chain, while in Piedmont and Lombardy, they form a continuous zone, skirting the northern slope of the Apennines, from Ceva on the west, to Fornovo on the east. The prevailing stratified rock of the Ligurian Apennines, according to Brocchi, is that known in the country by the name of *marigno*; but that term is applied to sandstones of very different ages, and, therefore, some uncertainty attends all descriptions in which it is used. It contains subordinate beds of limestone; but no veins or other deposits of metals have hitherto been found in it. Besides the calcareous beds that are subordinate to the *marigno*, there are extensive tracts of what Brocchi considered, but in some cases at least improperly, a transition limestone in the Ligurian Apennines, and the same rock appears in several places southward, along the shores of the Mediterranean. The mountains of San Julian near Pisa are composed of it; the broccatello marble of Sienna is a variety of it, and it is found in insulated hills at Piombino, Civit  Vecchia, and Cape Circello, the ancient *Cyrtan* promontory. Not a trace of this so called transition limestone is to be seen, according to Brocchi, on the eastern side of the Apennines. The southern limit of the *marigno* is not exactly known, but it is supposed not to extend beyond the neighbourhood of Cortona.

Among the unstratified rocks of Liguria, serpentine is by far the most important. According to Pareto, it is not found in the Maritime Alps, but commences near Savona, and occupies a considerable extent of country between that town and Genoa, and as far inland as Voltaggio. It is also met with in many parts of the Ligurian Apennines, forming detached groups of hills many miles distant from each other, and Brocchi describes it as occurring as far as Orbitello, which seems to be its southern limit. It is not confined to the Mediterranean side, but rises up near Bobbio, Fornovo, and between Sassuolo and Modena, in the basin of Lombardy. A variety of serpentine, containing a mixture of felspar and diallage, called in the country *granitone*, and by geologists *gabbro* and diallage-rock, is found in several places; and occasionally of a quality that makes it applicable for works of ornament. Serpentine, under all its forms, is now classed by most geologists among the rocks of igneous origin, and, from the observations of Pareto, Hoffman, De la Beche, and others, it is probable that the great dislocations and contortions which are observed in the stratified rocks of Liguria have been produced by the forcible injection of this rock among them, in a melted state, from the interior of the earth. That the serpentine was in a highly heated condition is inferred from the altered

structure of the slate and limestone, in many places where they are seen in contact with each other. Pareto is of opinion that this eruption of the serpentine took place prior to the deposit of the tertiary beds, but Elie de Beaumont considers that eruptions have repeatedly taken place, and even after the formation of the most recent strata, as the tertiary deposits, though usually horizontal, are sometimes highly inclined.

Near the southern extremity of the Ligurian Apennines there is a distinct group, called the Alpi Appuani, separated from the main range by a considerable depression. In this group are situated the celebrated marble quarries of Carrara, which have been worked since the time of Augustus, and continue to supply many kinds for architectural purposes and the finest qualities for sculpture: there is an immense export of the marbles to all parts of the world. This limestone was long considered a primary formation, and was usually referred to as the type of primitive limestone; but it was afterwards thought by many to be of a more modern date, and the German geologist, F. Hoffmann, who has lately visited that part of Italy, has discovered that it contains organic remains, and he assigns it to the same geological age as the oolite or Jura limestones. The highly crystalline state of the rock, and the disappearance of the greater number of the organic remains, he considers to be the effect of heat, when the eruption of the serpentine took place. He traced the limestone uninterruptedly to where it contains numerous fossils; from that point the beds increase in inclination, and gradually change their internal structure, and at last form a mass nearly thirty miles long, scarcely ever at a less elevation than 4000 feet above the sea, and rising often much higher, as in the Pania della Croce, at the southern extremity, 6102 feet, the Pizzo d'Uccello, at the north-west end, 6117 feet, and Monte Sacro, above Carrara, 5510 feet, on the slope of which the numerous quarries are worked. The limestone in the valley of the Frigido lies upon clay-slate, which rests upon mica-slate, and this last upon gneiss, and Mr. Hoffmann is of opinion, after very careful examination, that the two latter rocks are the clay-slate altered and rendered crystalline by the action of heat.

After leaving Liguria, the rock of which the greater part of the Apennines is composed is a limestone which presents itself under different aspects. It contains very few fossils, and affords very little interest to the geologist; its uniformity is absolutely wearisome. Once entered within its domain, we may travel for days without meeting anything to relieve the tedium of its eternal sameness. It is the sole constituent of the Apennines of Tuscany, Romagna, Fabriano, Foligno, and the Abruzzi, and stretches uninterruptedly through the provinces of Basilicata and Bari to the extreme point of Otranto. The Apennines come close to the left bank of the Tiber until that river takes a sudden turn to the south-west, in the immediate neighbourhood of Monte Sant' Oreste, the ancient Soracte, which is an outlier of the Apennines, as geologists term such detached hills, when they are composed of the same materials as the main ridge: it rises to the height of 2140 feet. In the Campagna di Roma, a range of mountains, composed of the same limestone, is separated from the central chain by the valley of the Tevere. This detached group, the territory and stronghold of the ancient Volsci, extends in a direction nearly north and south, from Mont' Fortino, a part of the ancient Montes Lepini, to the sea at Terracina, and rises in some places to considerable heights: according to the measurements of Prony, Monte Schiera d'Asino is 4878 and Monte Capreo 4816 feet above the level of the sea. Another subordinate range extends, as has been already stated, between Salerno and Nocera to Cape Campanella, on the south side of the gulf of Naples, of which the island of Capri is a prolongation. In this group, Monte St. Angelo di Castellammare rises to the height of 4688 feet, and Monte Solaro, in the island of Capri, to 3193 feet, according to Tenore in his *Géographie Physique du Royaume de Naples*.

On the western side of the Apennines the limestone is mostly covered by tertiary and volcanic products, so that it seldom appears far from the central chain, unless when the subordinate branches rise to considerable heights. On the eastern side the tertiary deposits do not extend so far south, at least they do not cover a great extent of country, and in some places, as in Puglia Pietrosa, a part of ancient Apulia, the limestone rises to the surface of the ground, in inclined

beds, from the central range to the sea shore: and in the culture of the olive and vine in that country, they break the masses of limestone to come at a layer of ochreous earth in which to set the plants. From the great scarcity of organic remains, we yet know little with certainty about the geological age of the Apennine limestones, and, indeed, we cannot say if they belong to one or to different periods; it is generally supposed that they belong to some part of our secondary series between the lias and the chalk, and most probably in greater part are equivalents, in point of age, to our oolite deposits. Like most other limestone formations, they abound in great caverns.

Calabria has hitherto been little explored by geologists. The Apennine limestone extends into it; but there are also large tracts of the country occupied by primary strata, and a granitic ridge passes through it, which rises to the height of several thousand feet. There are besides tertiary deposits, to which we shall afterwards allude.

Low hills of rounded undulating forms skirt the northern slopes of the Ligurian Apennines, and cover the greater part of the country on both sides of the Tuscan and Roman Apennines between the mountains and the sea. They have been called by geologists the *Subapennines*, as they never rise above a moderate degree of elevation. They are composed of marls, covered by yellow sand, both abounding in organic remains, and have been considered by Brocchi, who first described them in detail, and by other geologists, as belonging to one period of formation. But Mr. Lyell is of opinion that, while there is a considerable correspondence in the arrangement and mineral composition, there is not that close resemblance in all parts of the Subapennines which should lead us to assume an exact identity of age, and that the fossils they contain indisputably prove that they were deposited during three distinct periods. He considers that the tertiary strata of the hill of the Superga, near Turin, as well as the greater part of those in the valley of the Bormida, belong to the Miocene period; that the greater part of the Subapennine formations of Northern Italy and Tuscany, and perhaps those around Rome also, belong to the older Pliocene period; and that the tuffaceous formations of Naples, the calcareous strata of Otranto, and probably the greater part of the tertiary beds of Calabria, were deposited during the newer Pliocene period. (See Lyell's *Principles of Geology*, vol. iii. ch. xii.)

The marls are composed of clay, with much calcareous matter, are of a greyish-brown or blue colour, often without lines of stratification, but sometimes thinly laminated. They are frequently of great thickness, as in the neighbourhood of Parma, where the marl is 2000 feet thick. They contain beds of lignite and of gypsum, and detached crystals of gypsum; sometimes they pass into compact limestone, and occasionally there are interstratified beds of sandstone. They constitute very frequently the surface of the country, but more usually are covered with sand. The great arenaceous deposit lies generally upon the marl, but sometimes it is seen reposing on the Apennine limestone. It sometimes passes into a calcareous sandstone, and between Florence and Poggibonzi there is a range of conglomerate belonging to the same deposit, extending eleven miles, the pebbles of which are chiefly limestone. (Lyell, *ibid.* vol. iii.) Both the marls and the yellow sand abound in organic remains, but not universally, for there are often large tracts of both without any fossils. The shells are usually in a high state of preservation, even to their colours and the ligament which unites the valves; they are referable to species and families of which the habits are extremely diversified, some living in deep, others in shallow water, some in rivers, others at their mouth. Many are identical with species now inhabiting the adjoining seas, others with species now living in tropical seas. The remains of corals and fishes are not unfrequent, as well as detached bones, and even entire skeletons of whales and other cetacea. The skeleton of a whale twenty-one feet long was found by Cortesi near Castel Arquato, between Parma and Piacenza, in the marl, and oyster shells were adhering to a part of the head, showing that it must have lain as a skeleton at the bottom of the sea. Bones of land animals are frequently met with, and that they were transported to the bed of the sea is evident from their being associated with marine shells, and from the thigh-bone of an elephant having been disinterred, with oyster-shells attached to it, as in the instance of the whale's skeleton mentioned above.

Besides these marine tertiary deposits, there are others

which are lacustrine, that is to say, the materials must have been deposited in fresh-water lakes. A formation of this sort occurs in the Upper Val d'Arno: this great valley, which is surrounded by precipitous rocks, consists of three distinct basins, connected together; the uppermost is that of Arezzo, the next that of Figline, and the lowest that of Lucca. The basin of Arezzo contains a deposit of rolled pebbles, heaped together without any order, with fossil bones in the lower part of the mass, and covering a blue micaceous clay, with bones and beds of lignite. In the basin of Figline, the same clay is covered by rolled pebbles, fine sand, and coarse quartzose sand, and bones have been found in all the beds. In the basin of Lucca there are the same deposits of clay and sand, but the pebbles are wanting: these last are larger in size and more numerous in proportion as they are nearer the secondary rocks of Vallombrosa, in the upper part of the valley, from which they have been derived. These deposits rise considerably above the present bed of the Arno; the blue clay, which is always undermost, from 50 to 60 feet; the gravel as much as 200. They contain no fossil marine productions whatsoever, their shells belonging exclusively to fresh water. The most extraordinary circumstance connected with this lacustrine deposit, in the very centre of the Apennines, is the enormous quantity of the bones of great quadrupeds belonging to warm climates, some of them the inhabitants of swamps, and all of extinct species. They are the mastodon, elephant, rhinoceros, and hippopotamus; the skeletons of the latter are exceedingly abundant, no less than forty individuals having been found prior to 1829. Brocchi relates that such is the quantity of elephants' bones, that the valley is like a vast cemetery of these gigantic animals, and that before the peasants learned to keep these relics for sale to the curious, they used to inclose their gardens with legs and thigh-bones of elephants. Besides these greater animals, bones have been found of bears, hyenas, an animal like the panther, wolves, boars, tapers, horses, buffaloes, oxen, and stags. 'In winter,' says Mr. Lyell, 'the superficial degradation of the soil is so rapid, that bones, which the year before were buried, are seen to project from the surface of the soil, and are described by the peasants as growing.' In this manner the tips of the horns of stags, or of the tusks of hippopotamuses, often appear on the surface, and thus lead to the discovery of an entire head or skeleton.'

Besides this great lacustrine deposit of the Upper Val d'Arno, there are others of a like nature, such as at Cadibona near Savona, where strata of gravel, sand, and clay are associated with several seams of lignite or brown coal, from two to six feet in thickness, the whole deposit exceeding eight hundred feet in depth. In the midst of the coal beds have been found entire jaws and other bones of an extinct quadruped of the pachydermatous or thick-skinned tribe, called by Cuvier *Anthracotherium*, the bone itself being changed into a kind of coal.

We have still to notice a very important feature connected with the structure of the Apennines, namely, the region which has been devastated by internal fires. This region is nearly confined to the middle part of Italy, and to the western side of it. The volcanic district, properly so called, is bounded on the south by Cape Campanella on the south side of the Bay of Naples, and on the north by the river Ombrone, which enters the sea a little to the south of the island of Elba; the distance between those limits is about 230 miles. Its greatest breadth, which is about forty miles, is at Radicofani in the high road between Sienna and Rome, a volcanic mountain 3060 feet high. Monte Amiata, which is also volcanic, and 5791 feet high, lies immediately west of Radicofani. Volcanic action has long ceased in every part of this district, except at its southern extremity; and there are no historical records of that action, except with respect to Vesuvius and the country immediately contiguous. The volcanic matter which covers the country is mostly in the state of ashes and cinders, either loose or agglutinated together, forming what the Italians call *tuffa*; but there have been also eruptions of solid lava in many places, which are now seen in the form of beds and cliffs of hard rock. Of these last one of the most remarkable is the group of hills south of Rome, of which Monte Cavo, the ancient Alban Mount, is the most conspicuous part, rising to the height of 3110 feet. The waters of the Alban Lake fill the crater of an extinct volcano from which streams of lava once flowed over; one of these may be traced by the side of the Appian Way to within two miles of the gates of

Rome. In the quarries there, which have supplied the paving stones of the city both in ancient and modern times, the lava is observed to be sixty feet thick, and to rest upon previously ejected cinders. The Lago Bracciano, north of Rome, was once the crater of a volcano, and is now surrounded by hills of solid lava, which send forth numerous branches, ancient streams of melted stone, into the surrounding country; and between the lake and Civit  Vecchia there is a chain of limestone hills, at the eastern end of which lava has burst through, and now forms great vertical masses. Another range of hills, composed of compact lava, which branches out on every side, is in the neighbourhood of Viterbo; the highest point, Monte Soriano, the ancient Mons Cimms, is 1181 feet above the sea. The whole surface of the district we are now describing is not covered by volcanic products, for both the Apennine limestone and tertiary formations rise up in many places from beneath them, and in other places they are covered by fresh-water deposits which have been formed since the eruptions ceased. The country round Rome is overspread with volcanic matter, and the seven hills themselves are composed of the same materials lying above marine tertiary formations. These last are laid bare at the foot of the Capitoline Hill; and Monte Mario, on the right bank of the Tiber, 416 feet high, is wholly composed of the Subapennine deposits, large oyster-shells having been found in abundance at the very summit. The volcanic products are found high up among the sinuosities of the Apennine valleys: ascending the bed of the Tevereone, stony tufa forms lofty rocks near Vicovaro, above Tivoli, and still farther, at a short distance from Subiaco: in the valley of the Tiber it surrounds the insulated Soracte, and it is also found in the valleys of that branch of the Apennines which terminates in the sea at Terracina. It is an important circumstance in the geological history of Italy that the volcanic products alternate in many situations with the tertiary marine deposits, and that elephants' bones have been found at considerable depths imbedded in the tufa. Marine shells are contained in the tufa or volcanic ashes on the summit of Monte Cavo, at an elevation of more than 3000 feet above the sea. We pass over, at present, Mount Vesuvius and the great volcanic district which surrounds it, because these will be treated of with more detail upon a future occasion. There are several instances of volcanic action more in the centre of the Apennines, and far detached from the great region of volcanoes we have been speaking of, as at Teleso, between Capua and Benevento, and Mount Vultur in Apulia.

We have alluded to deposits still newer than the volcanic ejections; these are of fresh-water formation, and are an important feature in the physical structure of the country. They are composed of sands, clays, and marls, and of the solid stone called travertine, a corruption of the ancient name for it, viz. *Tiburinum*, because it was found in great abundance near the town of Tibur. All these deposits contain lacustrine shells, particularly such as frequent stagnant waters. The travertine is a deposit from water holding carbonate of lime in solution, by means of the carbonic acid which is common in spring waters; by exposure to air the carbonic acid escapes, and the carbonate of lime is deposited; such springs abound in many parts of central Italy within the volcanic region. In some parts of Tuscany the slanting sides of hills are covered with travertine. Several instances are mentioned by Mr. Lyell (*Principles of Geology*, vol. i. ch. xii.), and many by Brocchi, in his work on the geology of the neighbourhood of Rome. At Vignone, near Radiconfani, a spring has deposited a series of strata to the depth of 200 feet, and the stone is so compact as to form an excellent material for architectural purposes. At San Filippo, the water is so highly charged with calcareous matter, that a hard stratum of stone, a foot in thickness, is obtained in four months, and there is a deposit of it a mile and a quarter in length, a third of a mile in breadth, and 250 feet thick in some places. There are vast formations of travertine at Tivoli, and quarries of it at Ponte Leucano in the neighbourhood, which have supplied the materials for some of the most splendid edifices of ancient and modern Rome. These fresh-water deposits appear in so many places, that there is every reason to believe they extend over the whole country around Rome. Travertine, containing fresh-water and land shells, some of which are identical with the snails now common in the gardens of Rome, forms thick solid beds on the Aventine Hill above half a mile in length; and fresh-water deposits are found at the height of 150 feet above the

Tiber on the Esquiline Hill. In many places they contain the bones of elephants, and other land animals, as in the celebrated *Mons Sacer* near Rome, where elephants' bones, incrustated with calcareous spar, were dug out of a gravel pit, at a depth of thirty feet below the surface.

Before concluding this rapid sketch of the geological structure of the Apennines, it will be useful to draw the attention of the reader to those great revolutions in the physical constitution of Italy, which the records preserved in her mountains and her soil so clearly point out. Many and great changes must have taken place in that portion of the crust of the globe long before the Apennines were formed; upon the consideration of these we shall not enter but shall confine ourselves to events of a more recent geological date. It is an established principle in geology, that all stratified rocks containing marine remains must have been originally deposited at the bottom of the sea in a horizontal, or nearly horizontal position, and the inclined strata of the Apennines must therefore have been upheaved from the bed of the ocean; it is probable that they were at the same time raised some thousand feet above the surface of the water, forming a long tongue of land, or a chain of islands. The rocks of which they are composed must have been afterwards in part broken and abraded, to supply the materials of the conglomerates and other tertiary formations now found at their foot, for in all these the parent rock is recognizable, in rounded pebbles. These materials must have been washed down into the adjoining seas, together with remains of plants and of the animals which inhabited the land, where they formed stratified deposits, inclosing, during the process of consolidation, shells and other marine bodies. By a renewal of the internal elevating force these deposits were in their turn upheaved to form the Subapennine hills, and at the same time the central mountain chain must have been raised to a greater height, greater extension must have been given to the land, the islands disappearing as the lower parts of the mountains, of which they formed the summits, rose more and more above the surface of the water; and thus must Italy have assumed nearly its present form. But during the time that these tertiary formations were in progress, there must have been submarine volcanoes at work, which, from time to time, spread their ejections over the bed of the sea, and thus they became interstratified with the materials pouring down from the land. There must then have ensued a renewal of the upheaving force, and the effect of that, whether by sudden or by continued gradual elevations during a long period, amounted to a raising of the land at least 3000 feet, for marine shells are imbedded in the volcanic tufa of the Alban Mount at that height above the present level of the Mediterranean. This elevating process must have taken place subsequently to the ejection from the submarine volcanoes of the ashes and tufa which cover the country more or less on the western side of the Apennines from Tuscany to the borders of Calabria: for they are, for the most part, arranged in regular stratified beds and contain marine shells. That they were not deposited in fresh water is also evident from this, that they are found in the islands of Ischia and Procida where no great lakes could have existed; and in the former, marine shells imbedded in tufa were observed by Mr. Lyell at an elevation of 2600 feet. The new land thus laid bare must, in process of time, have become covered with vegetation, flourishing in a climate suited to the rhinoceros, elephant, and hippopotamus, which, with numerous other animals belonging to species now extinct, and of kinds now unknown in Italy, must have roamed there in vast numbers. In this state of things, parts of the country must have been covered by vast lakes of fresh water, for lacustrine deposits are met with at intervals nearly over the whole peninsula. Subsequently to this epoch, other great revolutions must have taken place when the barriers of these lakes were broken down, and when the erosions of torrents and denudations of floods fashioned the surface of the country into those forms which it now presents. Such are the conclusions to which an examination of the geological phenomena of Italy seems to lead.

The Flora of the Apennines is so very nearly the same as that of the Alps, that it would be superfluous to add anything respecting their botany, beyond referring to the latter article.

APENRADE, a Danish sea-port, situated at the bottom of a gulf, called the 'Apenrader F rde,' in the Little Belt, about twenty-seven miles N.N.W. of Schleswig, in the duchy

of which name it is comprised. It has sea-baths, a townsmen's and charity school, cotton-print works, and three poor-houses, and is defended by a castle, in which the bailiff of the place resides. The trade and navigation of the town support a population of about 3000. The harbour is shallow, and the shipping, therefore, are moored about a hundred yards below the bridge. Its open roadstead is unsafe in winter time. Long. $9^{\circ}38'$ E., lat. $55^{\circ}8'$ N.

APEREA, a species of wild guinea-pig. [See **CAVY**.]

APERIENTS, in medicine. [See **CATHARTICS**.]

APETALOUS plants constitute one of the divisions in Jussieu's *Natural System*. They comprehend all genera which are dicotyledonous or exogenous, and which have a calyx without corolla; by some they are called monoclamydeous. The character by which these plants are defined is as constant as any of those which botanists employ for subordinate divisions, but it must not be considered absolute: for not only are many of the genera which, in consequence of their natural affinities, are included among apetalous plants provided with rudimentary petals, but it occasionally happens that in orders otherwise constantly furnished with a corolla, particular genera occur in which no petals are produced; a very remarkable instance of which is to be met with in the pretty little shore-plant found on most of the sandy beaches of this country, and called *Glaur maritima*. This species is very nearly related to the primrose, and certainly belongs to the same natural order as that plant, but it has no corolla; in place of which the border of the calyx becomes coloured, and it therefore apparently belongs to the apetalous division, although, in reality, it forms an exception to the character of monopetalous plants. It is circumstances of this kind that chiefly constitute the difficulty of studying plants according to the *Natural System*; but it is a very great mistake to suppose that such cases are numerous enough to prove a serious obstacle to the student.

APHELION, from the Greek ἀπό, *from*, and ἥλιος, *the sun*, means that point of a planet's orbit which is farthest from the sun. Its opposite point is the **PERHELION**, from περί, *near to*, and ἥλιος, *the sun*, which is the nearest point to the sun.

Let S represent the sun, SAB the earth's orbit, or plane of the ecliptic, and SA a parallel to the line in which the earth's equator cuts the ecliptic, from which line all heliocentric longitudes (that is, measured round the sun) are measured in the direction of the earth's motion, represented by the arrow. Let CDE be a part of the orbit of a planet, SE the longest line which can be drawn through S, then E is the aphelion of the planet. If a plane SEG be drawn perpendicular to the ecliptic, the angle ASG is the heliocentric longitude of the aphelion E. The term is not usually applied to satellites, though they too have their aphelia.

The supposition of the planets moving in elliptic orbits round the sun is not true, unless the ellipses themselves be supposed slowly to change their positions and figures. In all the planets, except Venus, a very little more than a complete revolution must be made between two aphelia; in Venus, on the contrary, a little less. This inequality is represented by saying, that the aphelia of all the planets, except Venus, slowly increase in longitude, while that of Venus decreases. The apparent motion of the aphelia is greater than the real, since the line SA moves slowly backwards. [See **PRECESSION**.] The apparent annual motion of the aphelia is the annual precession of the equinoxes, together with the real annual motion, except in the case of Venus, in which the apparent motion is the precession of the equinoxes *diminished* by the real motion. The apparent motion of the aphelion of Venus is like that of all the others, in the direction of the earth's motion, for though the aphelion of Venus moves backwards, the line SA does the same at a *greater* rate. The following table gives the heliocentric longitudes of the aphelia of the bodies of the solar system at the dates specified, together with the *apparent* annual increase of longitude, made up of real increase and precession, as above described. Those of the

new planets and comets cannot yet be considered as ascertained with the same degree of accuracy as those of the old planets. All but the comets are taken from *Baily's Astronomical Tables and Formulae*.

Old Planets, January 1, 1801—

Planet.	Helio. Long.	of Aphelion.	Yearly apparent Increase of Do.
Mercury	254°	21' 47"	55".9
Venus	308	43 53	47 ".4
Earth	279	30 5	61 ".8
Mars	152	23 57	65 ".9
Jupiter	191	8 35	57 ".1
Saturn	269	9 30	69 ".1
Herschel	347	31 16	52 ".5

New Planets, January 1, 1820—

Vesta	69°	33' 24"	94".2
Juno	233	33 46	undetermined.
Ceres	327	7 32	121 ".3
Pallas	301	7 4	undetermined.

Comets—

Date.	Name of Discoverer.	Long. of Aphelion.
1835	Halley	123°
1832	Encke	337
1832	Biela	288

The longitude of the aphelion of Halley's comet is that predicted for its approaching appearance.

APHIS, the plant-louse, or puceron, an extensive genus of insects, interesting to naturalists on account of their very peculiar economy, and no less so to gardeners and farmers on whose crops many species commit most destructive depredations. As instances of the latter we may refer to the hop-fly (*A. humuli*) and the bean-dolphin (*A. fabae*): flowers, such as the rose, the China aster, and the various chrysanthemums, suffer from other species. During the summer of 1833, the cabbage and turnip crops in Kent were much injured and often destroyed by countless swarms of *A. brassicae*.

These insects are characterized by a soft oval body, a small head, entire and semi-globular eyes, antennæ of seven joints longer than the body, often setaceous, sometimes thickened towards the top, the two joints at the base very short, the next very long and cylindrical. The beak (*haustellum*) arises from the under part of the head between the fore-legs, and descends almost perpendicularly. The wings, when developed, are four in number, but some naturalists represent the upper wings rather as wing cases (*elytra*), from their difference of texture. The legs are very long and slender, in consequence of which they walk awkwardly. In sketching the history of these singular insects, it will be most convenient to begin it at the close of autumn, when many of the species, such as *A. quercus*, *A. rosæ*, &c., are numerous, some winged and some without wings, of both sexes, so that while the first may fly to a distance, the second are confined to their native plant or its vicinity.

After pairing, the mother aphid deposits what have been by some naturalists, termed eggs, in a place suitable, by their passing the winter; but different places are chosen by different species; some choose the oak, and place the eggs on an exposed twig high on the tree, others in the sheltered crevices of bark, or even under ground. Bonnet seems to be of opinion that the aphides are always viviparous and never lay eggs, what are commonly called eggs produced in autumn being a sort of cocoon, consisting of the young aphid inclosed in an envelope. From our own observations on those of the oak, we are convinced that this is the fact; but we cannot affirm, upon negative evidence, that none of the species lay real eggs.

The cocoons or eggs, whichever they may be, remain torpid during the winter (the parents having died after producing them,) and are called into life with the return of genial weather in the spring. The number of insects produced must of course correspond to the number of cocoons or eggs laid the preceding autumn, but being all ushered into active life at the same time, their simultaneous appearance has led to the popular, but erroneous notion, that they are generated by the air. *Blighting* weather, as it is termed, is also accused of spreading the destructive swarms over hop-grounds or bean-fields, but their rapid increase is wholly caused by their wonderful powers of multiplying.

All the aphides, it has been well ascertained, which appear in spring are exclusively females, no males being found till the autumn; and these females are endowed with a

fecundity almost incredible. M. Latreille says, one female during the summer months will produce about twenty-five a-day, and M. Réaumur calculated that one aphid may be the progenitor, during its life, of the enormous number of 5,901,900,000 descendants. It is not necessary for the young female aphides produced during summer to pair with a male, which indeed would be impossible, as no males are then to be found; yet these females go on producing each their twenty-five a-day of living young ones, all of which become in a short time as fertile as their parent.

This is a circumstance so different from anything known amongst other animals, and altogether so extraordinary, that it could not be credited had it not been proved beyond all contradiction by the careful experiments, suggested by Réaumur, of the French academicians, which may be seen at length in *Insect Miscellanies*, chap. x. The result was, that nine generations were obtained without pairing in the course of three months.

At the extremity of the abdomen most species are furnished with a pair of projecting tubes, through which they eject a sweet viscid fluid, well known under the name of *honey dew*, erroneously supposed to be an exudation from the leaves on which it is found. It is also said that the aphides feed on this, which is impossible from the structure of their mouths. Ants, however, and bees, are very fond of it.

APHORISM (*ἀφορισμός*), literally 'a limitation,' or 'a fixing of limits,' and hence used by the Greek writers to express a short sentence, containing a moral precept, or a rule of practice, briefly and forcibly expressed. The term has been adopted in medicine; for instance, both Hippocrates and Boerhaave have written books entitled *Aphorisms*, containing medical maxims, not treated argumentatively, but laid down as certain truths. For example, 'Neither repletion nor hunger, nor anything which exceeds natural limits, is good.' The word is similarly used in the civil law. We give the following as specimens of moral aphorisms.

'It is always safe to learn from our enemies; seldom safe to instruct, even our friends.'—*Læon*. 'He will easily discern how little of truth there is in the multitude; and though they are sometimes flattered with that *aphorism*, will hardly believe the voice of the people to be the voice of God.'—Brown's *Vulgar Errors*, book i. 3.

Sayings of this description are well adapted to make an impression on the memory; but they tend to substitute authority instead of judgment, as the motive of action, and may therefore be as well applied to maintain prejudices as to assert truths; to impose conventional and needless restraints, as to furnish safe rules of conduct to the inexperienced. It is with reference to this that Milton uses the word. 'There is no art that hath been more cankered in her principles, more soiled and slubbered with *aphorisming* pedantry, than the art of policy.'

APHRODITE, the goddess of love and beauty. According to Homer, she was the daughter of Zeus and Dione, one of the Nereides, or ocean nymphs; a later legend, told by Hesiod (*Theog.* 188), relates that she sprung from the foam of the sea, produced when Kronos threw into it the amputated members of his father Uranos. There was a celebrated picture of her rising from the sea (*ἀναρρομένη*), esteemed the master-piece of Apelles. (See *APELLES*.) She first came to land at the island of Cythera, and thence proceeded to Cyprus. These islands were her favourite places of resort, and many of her epithets are derived from them (Cytherea, Cypris, Paphia, &c.). She was assigned in marriage to Hephestus (Vulcan) the god of metal-lurgy, and there is a well-known tale of her detection in an amour with Ares (Mars) (See *Odys.* viii. 266). Hermes and Poseidon (Mercury and Neptune) were also among her favoured suitors. Her amours, however, were not confined to the gods. For her adventures with Adonis, see that article: she also bore Æneas to Anchises, a youth of the blood royal of Troy, as is largely related in the *Hymn to Aphrodite*, ascribed to Homer. In the Trojan war she was ranged with Apollo and Ares on the side of the Trojans, and in attempting to protect her son Æneas, was wounded by Diomed. According to the fictions of the *Æneid*, she continued to extend her maternal care over Æneas, and brought about his establishment in Italy, and through him the Julian family derived their descent from her. To the Italians she is known by the name of Venus; a goddess, probably, of indigenous origin, but so confounded in the

fictions of poets and mythologers with the Greek Aphrodite, that her original attributes have nearly disappeared.

The goddess is usually represented naked, or with very scanty drapery: her peculiar attribute is the *costus* (*casus* *ipide*, *Il.* xiv. 211), or embroidered girdle, which had the power of inspiring love for the person who wore it. Her favourite animals were the swan, the sparrow, and the dove; her favourite plants, the rose and myrtle. The bird called *junx*, much used in amatory magic, was also sacred to her. It is a general opinion that her worship was introduced from Phœnicia, and that she is identical with Astarte, the Phœnician goddess of the moon. In the ancient temples of Cyprus she was adored under the form of a conical stone, which was probably an ærolite. The Grecian artists represented her as the perfection of female beauty. One picture of Apelles we have mentioned; another, which he left imperfect, was esteemed so much that no artist dared to complete it. Many representations of the goddess in sculpture, on coins, &c., are extant: among these, the celebrated statue, called the Venus de' Medici, is that with which we are most familiarized.

APHTHO'NIUS, a Greek rhetorician of Antioch, whose epoch seems rather difficult to fix: some place him about the end of the second century A.D.; others, as Fabricius, in the third, and other critics still later. We know with certainty that he lived after Hermogenes, because he quotes this rhetorician, and, in fact, worked up the *Progymnasmatia* of Hermogenes into a new shape, also entitled *Progymnasmata*. There is a curious passage in *Aphthonius* about Alexandria. (See De Saey's *Abt-Abtath*, p. 182.) Aphthonius has also left forty Greek fables.

The work of Aphthonius is an elementary treatise on rhetoric; and in the sixteenth and seventeenth centuries it was much in use, and there were numerous editions of it. Since the end of the seventeenth century, Aphthonius has had no editor, and we believe very few readers.

Aphthonius was first printed by the elder Aldus with the other rhetoricians: *Rhetores Græci*, Venice, 1508, fol. The latest edition is by J. Scheffer, Upsal, 1670 and 1680, 8vo., with the *Progymnasmatia* of Theon.

APIAN, or **APIAN** (PETER), an astronomer, and, we may add, astrologer, born at Leipzig, died at Ingoldstadt, where he was professor of mathematics, in 1552, aged fifty-seven. His real name was Bienewitz, sometimes misspelt Binewilt. *Bien* in German signifies a *bee*, whence the Latin *Apianus*. He was in favour with Charles V., who gave him an order of knighthood and the title of Count, as well as more substantial rewards. He is principally remarkable for his observations of comets, and is said to have been the first who observed that their tails are generally turned from the sun. He also attempted the solution of astronomical problems by mechanism, as described in his *Opus Cæsareum*, and is said moreover to have pointed out the use which might be made of lunar observations in navigation. For a list of his works (which are now uninteresting), see Vossius de *Scientiis Mathematicis*; Montucla, *Histoire des Mathém.*, vol. i. p. 623; and Hutton's *Mathematical Dictionary*, article 'Apian'; but more particularly Kästner, *Geschichte der Mathematik*, vol. ii. p. 548, where more detail is given; or Teissier, *Eloges des Hommes Savans*, Leyden, 1715. His son Philip succeeded him at Ingoldstadt, which place he was obliged to quit in 1558, on account of his embracing the Protestant religion. He enjoyed some celebrity as an astronomer and mathematician, and died professor at Tübingen, in 1589. It is not correct, as stated in several accounts of which Montucla is apparently the source, that the only work of his which has been preserved is a letter to the Landgrave of Hesse-Cassel. (See *Biographie Universelle*, and the work of Teissier above cited.)

APIARY, a place for keeping bee-hives, derived from the Latin *apis*, a bee, and formed like the word 'aviary.' The proper situation of an apiary engaged the attention of ancient bee-keepers as much as it does in modern times, and, leaving out a few fanciful particulars, the directions given by Columella and Virgil are as good now as when they were written.

As to the aspect of the apiary, Virgil says—

'A station must be found
To gusts of wind and frosts of snow.'—*George iv.*

Milton alleges that 'it is not material in what aspect the stock stands, provided the sun shines on the hive once in the course of the day, for that well-peopled hives, kept dry, will thrive in most situations.' Wildman, again, tells

us, that the apiary should face between the south and west, in a place neither too hot nor too much exposed to the cold. 'I have ever found it best,' he says, 'to place the mouth of the hives to the west in spring, care being taken that they enjoy the afternoon sun: the morning sun is extremely dangerous during the colder months, when its glare often tempts these industrious insects out to their ruin; whereas the mouth of the hive being then in the shade, the bees remain at home, and as clouds generally obscure the afternoon's sun at that season, the bees escape the temptation of going out. When food is to be obtained, the warmth of the air round the hive continues in the afternoon, which strengthens the bees, and enables them to pursue their labours.' Dr. Evans, in his pretty poem, gives very similar directions —

'Seren'd with the east, where no delusive dawn
Chills, while it tempts them o'er the dew-damp lawn;
But as on loaded wing the laborers loam,
Sul's last bright glories bid them to their home.' — *The Bees*.

Bonner stands alone in recommending an easterly aspect, which we frequently observed to be chosen in the numerous apiaries in Germany: we found those in Switzerland and Savoy more commonly placed towards the west.

Wildman prefers a situation in which bees 'returning home from their labours may descend,' and Keys says, 'a valley is preferable to high grounds to favour their increase'; but this is of less importance, perhaps, than having free egress and ingress in right lines from and to the apiary.

As to the adjuncts of the apiary, the old recommendations of Virgil are as excellent as any in modern works. He says —

'Let fresh springs and ponds,
Verdant with moss, be near; and shallow brooks,
That with swift current through the meadows run;
The neighbouring banks may tempt them to avoid
The heat; and trees with hospitable boughs
Obscure detain them. — Whither dull in ponds
The water stand, or flow in brimming rills;
Into the mid-st throw willow boughs, and reeds,
And planky stones; where, as our ladies say,
'They may alight; and to the summer sun
Expand their wings; if chance the eastern blast,
Boist'rous, has sprinkled them returning late;
Or plung'd them, blown a-sunder, into the waves.' — *Trapp*.

Dr. Bevan thinks an apiary would not be well situated near a great river, nor in the neighbourhood of the sea, as windy weather might whirl the bees into the water and destroy them; yet we have seen very thriving apiaries all along the Rhine, and on the borders of the Swiss lakes. Others have recommended the neighbourhood of the sea-coast as very eligible, from a notion that the bees are fond of sea water, which, however, Keys denies from personal observation, his own bees having been kept near the sea.

Heaths, or places abounding in wild flowers, are the best sites for an apiary, and, in default of this, pasturage must be provided, such as gardens where flowers are cultivated, and fields in which are sown buck-wheat, clover, or sainfoin. The expedient of transporting apiaries to distant places, so as to take advantage of the seasons when different flowers are in blow, has been resorted to in various countries, particularly in Egypt, and along the great rivers of Europe.

M. Maillet, who was French consul in Egypt in 1692, informs us that, about the end of October, all such inhabitants of Lower Egypt as possess hives, embark them on the Nile, and convey them upon that river to Upper Egypt; calculating to arrive there at the time when the inundation is subsiding, and the lands having been sown, the flowers begin to bud. The hives being come to this part of Egypt, are there placed pyramidically in boats prepared for that purpose, after being marked and numbered by the several owners. Here the bees feed in the fields during some days, and when it is supposed that they have got in all the honey and wax that can be met with within two or three leagues round, their conductors convey them in the same boats two or three leagues lower, and remain there as long as is necessary to enable them to collect all the riches of the new station. Thus the earth forwards its productions, and the plants come into bloom in proportion as they come nearer to their place of abode. In fine, about the beginning of February, after having travelled through the whole length of Egypt, they arrive at the spots whence they had set out, and return to their respective habitations: for care is taken to set down exactly, in a roll or register, every district whence the hives set out in the beginning of the season, their number, and the names of the particular persons who sent them, as likewise the mark or number of the boats, in which they were placed according to their several habitations, and the place where they were landed upon the Nile, between Cairo and

Damietta, a convoy of 4000 hives in their transit from Upper Egypt to the Delta.

Goldsmith describes, from his own observation, a kind of floating apiary in some parts of France and Piedmont. 'They have on board of one barge,' he says, 'three-score or a hundred bee-hives, well defended from the inclemency of an accidental storm; and with these the owners float gently down the stream: one bee-hive yields the proprietor a considerable income. Why,' he adds, 'a method similar to this has never been adopted in England, where we have more gentle rivers, and more flowery banks, than in any other part of the world, I know not; certainly it might be turned to advantage, and yield the possessor a secure, though perhaps a moderate income.'

Dr. Bevan strongly recommends the apiary to be roofed in by erecting a bee-house, or converting to that use some building already constructed, as much preferable to an apiary out of doors, both for convenience and security, as well as ultimate profit. He thus describes his own:—'The whole building, besides answering the purpose of an apiary, may be made subservient to other uses: my own serves for storing potatoes. The potatoe-cellar is sunk two thirds of its depth in the earth, and the bee-house is raised upon it, having a couple of steps up to the door. The dimensions of both are seven feet six inches by six feet clear within, which affords room for five colonies.

'The piles or stories of bee-boxes are placed in the bee-house at somewhat less than two feet apart, so as to make the external entrances to the several piles about a yard asunder. (See the plate which forms the frontispiece of Dr. Bevan's work.)

'On the inside of the bee-house, the boxes in the upper row stand about table height, those in the lower about six inches above the floor. On the outside, the entrances to the upper row are about five feet, to the lower about three feet from the ground. The entrances through the wall may be cut in stone, bricks, or wood, and should be chamfered away on the outside, leaving the wall at those parts as thin as practicable, and letting the opening correspond in size with the outlets that are sunk in the floor-boards hereafter described. The potatoe-cellar is built with bricks, the bee-house of timber, lathed and plastered within, and thatched on the outside.

'Where the bees enter the boxes, two wooden shelves or resting-boards are fixed, two or three inches thick, to prevent warping; they extend the whole length of the building, are about a foot wide, and rest on cross pieces nailed fast to the uprights with which the bee-house is built; these cross pieces extend, also, about fifteen inches into the bee house, where they serve as supporters for the shelves on which the bee-boxes are placed. The resting-boards on the outside are divided, by bricks on the edge, into several compartments, as shown in the frontispiece: the bricks extend the full width of the resting-board, and all the compartments are slated over. Thus the entrances are sheltered, and accommodation is afforded for the bees when they are at any time driven home by stress of weather in greater numbers than can readily pass through the entrances into the boxes.

'The building is not only thatched on the top, but down the sides and ends, as low as the potatoe-cellar. On that side where the bees enter the boxes, the thatch, of course, terminates at the top of the compartments, over which it is spread out so as to conceal the slate coverings. The floor of the bee-house is boarded, and the potatoe-cellar is coiled, the space between the ceiling and the floor above being filled up with dry saw-dust.'

It is but right to say, however, that Keys is altogether against placing hives on benches, and he thinks it a great deal worse to have them under eots or sheds with shelves therein one above another, on the principle recommended by Dr. Bevan, inasmuch as these afford harbour for enemies, and are inconvenient to manage. Keys himself recommends for each hive separate stands made by driving four strong stakes into the ground three or four feet apart, in the form of a square. Eight or ten of these in one place, he thinks, are enough, and when more swarms are to be disposed of, he thinks it better to have them in separate gardens to prevent quarrels, which often happen when the swarms are numerous.

The various forms of hives will be noticed under the article HIVE.

APICIUS. There were three Romans of this name, all of them celebrated for their love of good eating. The first

was contemporary with Sylla; the second with Augustus and Tiberius; the third with Trajan. Of these the second is the most famous, being celebrated by Seneca, Pliny, Juvenal, Martial, &c. Athenæus (p. 7, Casaub.) places him under Tiberius; besides his general reputation for profuse and delicate attention to the gratification of his own palate, he obtains credit with that author for original genius in the composition of certain cakes, honourably distinguished by the epithet *Apician*. Seneca says that he was alive in his time, and infected the age by establishing a regular school of professors and pupils in the science of good eating in Rome, from which, in the days of simplicity and severity, even philosophers had been expelled as the corruptors of youth. The inordinate expense of his culinary establishment reduced his fortune and involved him in debt; he therefore found himself obliged to look into his affairs, and regulate his expenditure. He found that when his incumbrances were cleared off, he should have left a pittance utterly inadequate to keep such a body and soul together; wherefore, he took poison in preference to pining after unattainable luxuries. Pliny calls him the greatest gourmandizer that ever appeared in the world, and mentions various ragouts invented by him; in short, he was the *Cook's Oracle* of imperial Rome. The third Apicius is to be honoured as the inventor of the art of pickling oysters (Athen. 7.); several jars of which he sent to the Emperor Trajan when in Parthia. Distant as was their destination, they reached it in high preservation and tempting savour.

The name of Apicius, long after the time even of the last of these three philosophers, was familiar as a household and culinary word. Their fame was perpetuated by the spirit of party: and the cooks of ages after were divided into Apicians and anti-Apicians. A treatise *De re Culinarie* is extant under the name of Caius Apicius. It is considered by critics as antient, although not written by any of the three whom we have mentioned. Martin Lister republished it in London in 1705, with the title *De Obscenis et Conditivis, sive de Arte Coquinaria*. The humorous Dr. King ridiculed it in a poem, entitled *The Art of Cookery*. (See *Biog. Universelle*.)

A'PION, son of Poseidonius, was born in Oasis, a town in Libya, seven days' journey from Thebes, probably the modern Oasis, called El Wah. Apion was educated at Alexandria, and wished to pass for a Greek native of that city, although he was of Egyptian extraction. Some have thought that the name of Apion is derived from Apis. Apion was a disciple of Apollonius, the son of Archibius, and of Didymus, from whom he imbibed his fondness for the poetry of Homer. Under the emperor Claudius, who reigned A. D. 41—54, he succeeded the Grammarian Theon at Rome. When the Greek inhabitants of Alexandria endeavoured to deprive the Jews who resided there of the privileges conferred upon them by Alexander the Great at the foundation of the city, and confirmed by the Ptolemies and the Cæsars, Apion was appointed to advocate their cause against the Jews. On this occasion he endeavoured to kindle the wrath of the emperor Caius Caligula, by pointing out, that the Jews would neither erect statues to the emperor, nor swear by his name, whilst they preferred to worship the head of an ass made of solid gold, which was of immense value, and was stated to have been first discovered when Antiochus Epiphanes entered the temple at Jerusalem. Antiochus Epiphanes was reported to have taken this idol away, and to have set a Greek captive at liberty, whom he found confined within the sanctuary in order to be sacrificed after having been fattened by the most delicious animal food. It was stated that the Jews were in the habit of preparing every year such a human sacrifice, in the intestines of which they discovered the events of futurity, and that all Jews tasted annually these human entrails, in order to pledge themselves afresh to hate the Greeks.

Apion, with these monstrous fables, did not fully succeed against Philo, who was sent to Rome by the Jews of Alexandria, to plead their cause. Philo, who was at the head of the embassy of the Alexandrian Jews, commenced his reply to Apion's accusation, but the Emperor Caius insultingly commanded him to leave the imperial presence. All expected the worst consequences from the Emperor's wrath, but Philo said to the bystanding Jews: Be of good cheer, for Caius attacks us with words, but really he has begun to fight against God. The Emperor sent Petronius, the successor of Vitellius, as legate to Syria, with orders to place a

statue of his imperial, or rather divine majesty, in the temple at Jerusalem. Petronius marched an army into Judæa, but was so much touched with the intreaties of the Jews not to profane their sanctuary, and with their readiness rather to die, than to admit the emperor's statue, that he delayed the commencement of the war, and requested the emperor to revoke his orders: Caius granted this revocation to his favourite Herodes Agrippa, but commanded Petronius to commit suicide for his disobedience. The news of Caligula's death arrived in Syria before the letter in which Petronius was ordered to kill himself, if he would avoid the tortures prepared for him. Thus, Apion's plan to hurt the Jews was providentially foiled. (See Joseph. *Archæologia*, l. xiv. cap. 8.)

Philo's work, entitled *ἀπὸ ἀπορίας καὶ πρὸς τὸν βασιλέα Καίσαρος, Embassy to the Emperor Caius*, is still in part extant. Apion was esteemed for his learning, but already, before his contest with Philo, he was known at Rome as a man of ostentatious character. Tiberius named him *Cymbalum mundi*, *Cymbal of the universe*, on account of his vain boastings; but Pliny, Apion's disciple, calls him rather *publicæ famæ tympanum*, or the *kettle drum of fame*. The following writing of Apion we find quoted: *Ἐγυπτιακά*, in five books; this work contained a description of the curiosities of Egypt: *A History according to Nations; On the Merits of Alexander the Great; Against the Jews; On the Luxury of Apicius; On the Language of Rome; De Disciplinâ Metallurgicâ; Νέκρ' Ὀφθαλμοί*. But of all these writings, there have only been preserved the story of *Androclus and the Lion* (Gellius, v. 14); and the *Dolphin at Dicearchia* (Gellius, vii. 8), with fragments from the work against the Jews, preserved by Josephus in his reply.

Flavius Josephus wrote two books on the antiquity of the Jews against Apion after his death. In the first book Josephus refutes the gross mistakes and misrepresentations of Manetho, Berosus, and many other Gentiles who had written without accurate information on the affairs of the Jews. Most of the works against which Josephus wrote are now lost, and only known from his quotations. In the beginning of the second book, Josephus refutes especially the misrepresentations of Apion and his authorities. The dedication of these two books to Epaphroditus, bears some resemblance to the dedications prefixed to the Gospel according to St. Luke, and the Acts, to Theophilus. (See *נורית בן יוספון* pages 535 and 536, ed. Brethaupt. Seneca, ep. 88. Phil. *Progr. Hist. Nat.* and lib. xxxvi. c. 12, Ersch and Gruber: *Sudas*, ed. Küster, i. p. 267.)

APIS. [See BEE.]

APIS, a sacred bull, whose station and temple were at Memphis in Egypt. He must be distinguished from Mnevis, the sacred bull of Heliopolis. The real or true Apis was known from among all other bulls by certain marks, which are mentioned by Herodotus and Pliny (iii. 28; viii. 46). His birth is commonly described as miraculous: though produced from a cow, his conception was caused by the descent of lightning, or the influence of the moon's beams. When the bull Apis died, or had been put to death after living the prescribed number of years (according to some authorities), a successor was diligently sought for, and, when found, was installed in his temple of Memphis with all due solemnity. The cow was not eaten in Egypt, but the bull was used as food; yet no bull could be slaughtered till it had been first ascertained that it had none of the marks which characterized a sacred bull. When this was ascertained satisfactorily, the priests put a seal or mark on the animal, to signify that it might be slaughtered: no unstamped bull could be slaughtered, under pain of death. The object of the regulation was probably the raising an income by a tax on slaughtered animals. There might possibly be other reasons also. (Herod. ii. 38.)

The worship of Apis existed at least as late as the reign of Septimius Severus. We hear of Greeks and Romans of rank paying their respects to the bull of Memphis, in which curiosity and superstition appear to have been blended. Alexander the Great, when he visited Memphis, sacrificed to all the Gods, and Apis among the rest, in which he showed more political wisdom than the Persian madman Cambyses, who, 200 years before, had insulted the Egyptians by slaying their deity. Germanicus Cæsar, when he visited Egypt in the reign of Tiberius, went to see Apis at Memphis. It was a favourable sign when the animal would take food from the hand of his visitor, and the reverse was looked upon as presaging misfortune. The bull refused what the hand of Germanicus offered, and the Roman general died

shortly after at Antioch. Strabo describes the Apis and his temple in the following terms, at the time of his visit to Egypt (xvii. p. 807):—'Memphis contains a temple of Apis, who is the same as Osiris. The bull Apis is kept in an apartment (*σπηλις*), and is regarded as a god: he is quite white on the forehead and some other parts of the body, but in every other part black. By these marks they always decide which bull is to be the successor of Apis when he dies. In front of the apartment is an inclosure, in which there is another apartment for the bull's mother. They allow the sacred bull to come into this court or inclosure at certain times, and chiefly for the purpose of being shown to strangers.' The bull Apis, it is presumed (Herod. iii. 29.), was embalmed when he died. Lucas says (vol. i. p. 345, *Voyage fait en 1714*) that he observed bulls' heads in several niches of the catacombs of Abousir: he also found a bull embalmed, and in a great chest, on which the head of the animal was represented: the case, he says, was gilded and painted. (See also *Abd-Allahif*, De Sacy, p. 201.)

The deity Apis was probably a symbol of the Nile (see Jablonsky, *Pantheon*, Apis), or of the earth and fertility, as the cow also was in the Egyptian, and still is in the Hindoo mythology. The god Sivas, in the Indian mythology, has his sacred bulls, which are characterized by certain marks, and a colossal bull of stone is often an ornament of his temples. The bull (but not the cow) is an object of worship still in India. (See Colonel Briggs' *Letters on India*, p. 72.) The sacred bulls of Benares still walk about the streets of the holy city, or stop up the road, and cannot be disturbed without all due respect.

The tendency of the Israelites to fall into the idolatrous worship of the bull or cow is seen from the history in Exodus, xxvii.; and at a later period, Jeroboam, who had spent some time in Egypt, set up two calves, one at Dan and the other at Bethel, and established temples and priests, probably in honour of Apis and Mnevis respectively. (See 1 Kings xii.; compare Hosea, chap. x.; Böhlen's *Alles Indien*, i. 252, &c.; Jablonsky's *Pantheon*.)

APIUM is the botanical name of a genus of umbelliferous plants, among which the only species of any importance is the common celery, *Apium graveolens*. This valuable vegetable is found naturally in the ditches of almost every part of Europe; it is even met with in the Falkland Islands, where, if it has originally been carried thither, it has naturalized itself. In this country it is very common in many places, as, for instance, in the ditches near Sandwich.

It is a remarkable fact that this plant, which is so sweet and wholesome when cultivated, is altogether acrid and unfit for food when wild. It is by some supposed that the difference between the quality of the two states is owing to so large a part of the stem and leaves of the cultivated species being hidden from the action of light by the soil which is heaped up about it, and being in consequence unable to generate in much abundance the peculiar principle on which the acridity depends. Whatever may be the value of this explanation, it evidently does not apply to the variety called *celeriac*, in which the sweetness and wholesome character of cultivated celery are maintained, although no part of the leaves are deprived of the full influence of light.

For the culture of celery and its varieties, see **CELERY**.

Parsley, which was formerly considered a species of apium, will be noticed under **PETROSELINUM**.

APIOME. [See **GARNET**.]

APOCALYPSE. The word *apokalypse* (*ἀποκάλυψις*) signifies literally *uncovering*, *unveiling*, and is used in the New Testament to express especially an extraordinary revelation of the will of God. In this sense the apostle Paul speaks of his 'preaching Christ according to the revelation (*κατὰ ἀποκάλυψιν κυρίου*) of the mystery, which was kept secret since the world began, but now is made manifest, by the commandment of the everlasting God made known to all nations for the obedience of faith.'—Rom. xvi. 25, 26. Compare also 1 Cor. xiv. 6, where we find that when the Christians assembled, every one had a psalm, a doctrine, a tongue, a revelation (*apokalypse*), or an interpretation. In these and similar passages the gift of teaching, of interpreting, and of announcing future events is distinguished from the revelation (*apokalypse*) of the council of God to the spirit of the receiver.

But the word *apokalypsis* is used in a still more confined sense, to express especially the prophetic revelation of the future development of the Messiah's kingdom. Works which describe future conflicts between the power of the

Messiah and the opposing powers of Satan, unbelief and superstition, form the apocalyptic literature. The revelations in these works communicate visions in symbolical language. The *apocalyptic* is a branch of the *prophetic* literature. Every *apocalyptic* book is prophetic, but every prophetic book is not apocalyptic.

Apocalyptic writings develop that future kingdom of the Messiah which constitutes an essential part of the Biblical doctrine in the Old as well as in the New Testament. Apocalyptic, as well as profane literature, has its epochs and periods of flourishing and of decay; and it is divided into canonical and apocryphal branches.

The first epoch is the Jewish. The book of Daniel is the prototype of all subsequent apocalypses. The fundamental idea of Jewish apocalypses is the first advent of the Messiah in order to lay the foundation of his kingdom. In the Jewish apocalypses, everything concerning the Messiah is future.

The second, or the Christian, epoch, of apocalyptic literature begins after the development of Christ's kingdom: consequently, the Christian apocalypses are clearer than the Jewish. The Jewish apocalypses still continued after the first advent, as long as the ideas about the Messiah retained great vigour among the Jews; but they degenerated into apocryphal imitations of earlier apocalypses. These apocryphal apocalypses of later Jews were often interpolated by Christians. The decay of Jewish apocalypses after the first advent was necessary; because Christianity is the only true continuation of Biblical Judaism. The stream of Jewish apocalypses is lost in the sands of the Talmud. Some account of Jewish apocryphal apocalypses will be given under the articles **HEXOCCH**, **ESRA**, **PATRIARCHS**, **ISAIAH**.

In the history of the Apocalypse, we have to consider who was the author of the work who calls himself at the commencement of the first chapter:—'Johannes a servant of the Lord.' Some critics have asserted that this description which the author gives of himself is a proof that the Apocalypse was not written by the apostle St. John, but by another servant of the Lord, who would not assume any apostolic dignity; and, further, that in the usual title of the book (*Ἀποκάλυψις Ἰωάννου τοῦ Θεολόγου*) he is not called St. John the apostle, but only John the divine, or the theologian. But most critics suppose that the present title to the Revelations can only refer to that apostle who wrote more explicitly about the divine *logos* (*θεοῦ λόγος*) than any other of the evangelists. Those who entertain any doubt on this head will find in Suicer's *Thesaurus* that the Greek words from which our terms *theology* and *theologian* are derived, mean respectively in the ancient fathers, especially the doctrine of the incarnation of the *logos* and teachers of the *logos*. Whoever compares the phraseology, imagery, and doctrine of the Apocalypse with that of the gospel and the epistles of St. John, will, indeed, find a great difference. The Greek style of the Apocalypse is strongly tinged with Hebraisms, and its imagery is bold. The style of the gospel and the epistles approaches more nearly to the classic Greek, and is almost without imagery.

Polycarp, bishop of Smyrna, a successor of one of those pastors to whom the seven apocalyptic letters in chap. ii. and iii. were addressed, was a disciple and friend of St. John the apostle; and Papias, bishop of Hierapolis near Laodicea, was, according to the statement of Irenæus (*Adv. Hær.* v. 33.), 'a hearer of John and a friend of Polycarp.' Polycarp and Papias were highly esteemed authors. Polycarp's letter to the Philippians is still extant, but of the writings of Papias some fragments only have been preserved. In Polycarp's letter to the Philippians the Apocalypse is not mentioned; but his disciple Irenæus acknowledges its authenticity, and appeals to the testimony of those who had seen the face of St. John.

We have the testimony of the two Cappadocian bishops, Andreas and Arethas of Cæsarea, who lived in the last quarter of the fifth century, that Papias recognised the inspiration and authenticity of the Apocalypse. Andreas says, at the conclusion of his introduction to his commentary on the *Apocalypse*, 'It is unnecessary to make many words about the inspiration of the Apocalypse, since those blessed men, I mean Gregory the theologian and Cyril, and besides these the more ancient also, Papias, Irenæus, Methodius, and Hippolytus, testify to its credibility.' Arethas being later, repeats nearly the same statement in the preface to his own commentary. Papias died, according to the

Alexandrine Chronicle, A.D. 163; therefore he must have been very young when he heard St. John, who died about A.D. 98.

Justinus Martyr, who lived between A.D. 140-160, and was nearly contemporary with Polycarp and Papias, was born in Palestine, and acquainted with Alexandria, Rome, and Asia Minor. At Ephesus he held his famous dialogue with Trypho the Jew, which is still extant. Justinus Martyr quotes in this dialogue Jer. lxxv. 17, &c.; Gen. ii. 17; Ps. lxxxix. 4, to support his doctrines about the millennium, and adds, that John the apostle, in the *Apocalypse*, likewise prophesied, that the believers in Christ should dwell in Jerusalem 1000 years before the general resurrection and final judgment should take place.

Melito, bishop of Sardes, to which town one of the apocalyptic letters is directed, belonged to the biblical critics of the second century, and wrote, according to Eusebius, 'on the devil and the *Apocalypse* of John.' Jerome says, in effect, the same.

Probably at the conclusion of the second century, Theophilus, bishop of Antioch, wrote against the heresy of Heriogenes. This work is lost, but Eusebius, who read it, testifies that Theophilus took some proofs (*παρρησιαι*) from the *Apocalypse*. Theophilus seems also to use apocalyptic language in his work (*Ad Autolyceum*, ii. 28); 'the demon (devil) is also called dragon (*ὄφας*).' Hence we infer that the *Apocalypse* was known in the second century and influenced the language of the Christians.

Eusebius mentions likewise that Apollonius (who was, according to the book *Prædestinatus*, which was written in the fifth century, bishop at Ephesus in the second century) quoted the *Apocalypse* against the Montanists themselves, although these heretics derived their errors especially from this part of the New Testament.

But the most important testimony in favour of the *Apocalypse* is that of Irenæus, who died bishop of Lyons A.D. 202. Irenæus, in his work against heretics, quotes long passages from the *Apocalypse* of John, whom he calls expressly the 'disciple of Jesus' and 'the recipient of the revelation.' This presupposes that its canonical character was then generally recognised. Irenæus defends the apocalyptic number 666 against the spurious 616, by stating that all warranted old manuscripts contained 666, which number was also supported by the testimony of those who saw the face of John. Irenæus modestly confesses his own inability to explain this number, and says: 'If the name of Antichrist were to have been openly proclaimed in our days, it would have been declared by him, who saw the revelation, for it was seen not a very long time ago, but almost in our own age, namely, at the conclusion of Domitian's reign.' This testimony is important, because Irenæus was born in Asia Minor where the *Apocalypse* was published; and he grew up in friendly intercourse with Polycarp of Smyrna. Irenæus knew the friendly circle of St. John, and the accounts which were in vogue among his disciples. Irenæus had a very extensive acquaintance with the most distinguished Christians in the east and west, and took a lively interest in the religious differences and theological debates of the second century; consequently, we have reason to say, that Irenæus was a qualified witness. There can be no doubt that he believed the *Apocalypse* was written by John. Irenæus mentions that the authenticity of St. John's Gospel was attacked by some, but he mentions no opposition to the *Apocalypse*.

The letter by which the Christian congregations at Vienne and Lyons report to those in Asia and Phrygia the persecutions suffered under Marcus Aurelius, A.D. 177, proves likewise that the *Apocalypse* was then much read and generally recognised in Gaul and Asia. Irenæus was presbyter at Lyons when this letter (see Eusebius *Hist. Eccles.* v. 1-3) was written, and, perhaps, it was drawn up by him or under his direction. The numerous Greeks who migrated from Asia Minor into Gaul probably took with them the *Apocalypse*.

The third century is the most interesting in the history of the *Apocalypse*. The disputes against the Montanists raised, among other theological questions, that concerning the authenticity of the *Apocalypse*. (See MONTANISTS.) Tertullian, in his Montanistical writings, constantly appeals to the *Apocalypse*, and presupposes its genuineness. (Marc. 4, 5.)

It is very important that the spiritualizing Origen not only mentions the *Apocalypse* as being written by John, (*Comment. in Ev. Joannis* ed. Lommatzsch, tom. i. l. 6.) but says very decidedly in his Commentary that John, who re-

clined on the breast of Jesus, wrote the *Apocalypse*. Origen classified the books then used by Christians into *genuine*, *spurious*, and of *uncertain* authority, and numbers the *Apocalypse* among the *genuine* canonical books.

Origen was the greatest biblical critic of the third century; and it is an important fact that, in investigating the canonical limits of the *New Testament*, he did not meet, either in the schools of Alexandria, or in his numerous theological peregrinations, with any sufficient reason for doubting the apostolical authority of the *Apocalypse*. In spite of opposition from a sect called the *Alogi*, who asserted that the *Apocalypse* was an unintelligible and irrational fabrication of Cerinthus, it maintained its authority to the middle of the third century in churches far distant from each other, and it was used in theological researches and ecclesiastical transactions as a holy writing of the apostle St. John. But the Syrian national church, which was established either at the conclusion of the second or the beginning of the third century, omitted in the *Peshito* the second and third epistles of John, the second of Peter, the epistle of Jude, and the *Apocalypse*. These parts were added to the Syrian *New Testament* in or after the sixth century. But Theophilus of Antioch in the second, and Ephraem Syrus in the fourth century, quote the *Apocalypse*, and ascribe it to John. Hence we perceive that the *Apocalypse*, although wanting in the *Peshito*, was recognised among the theologians of the Syrian church. (Compare Lengerke *de Ephraemi Syri Arte Hermeneutica*, p. 5-8.)

During the fourth century the *Apocalypse* was used in the oriental church by Athanasius, Basilus Magnus, Gregorius Nyssenus, Didymus, Ephraem Syrus, and others. But Cyrillus of Jerusalem, who died A.D. 386, in his fourth Catechesis, advises his catechumens to read only those writings of both Testaments which were received by the church, and to neglect the apocryphal publications. Cyrillus gives a list of these canonical writings in which the *Apocalypse* is omitted. But his fifteenth catechesis seems to contain allusions to the apocalyptic phraseology.

The canon of the synod of Laodicea, which was held about A.D. 363, rejects the *Apocalypse* from the ecclesiastical canon; and so likewise the eighty-fifth of the apostolical canons, which belong, perhaps, to the fourth century.

Gregorius Nazianzenus says, in his verses on the genuine books of the inspired Scripture, after having mentioned all the other books of the *New Testament* except the *Apocalypse*, 'Thou hast them all. If there is another besides these, it belongs not to the genuine.' But the same Gregorius quotes, in his other writings, the *Apocalypse* as if he considered it genuine, and he is mentioned by Andreas and Arethas among those who recognized its inspiration and canonical character. Therefore, it is probable that the *Apocalypse* was reserved to the use of the clergy, who, remembering the Montanistic abuses, endeavoured to get the *Apocalypse* out of the hands of the laity without denying its genuineness. By this conjecture an apparent contradiction is solved.

The general ecclesiastical tradition as to the apostolical origin of the *Apocalypse* continued uninterrupted to the middle of the third century, except by the opposition of the *Alogi*. But Dionysius, a disciple of Origen, and bishop of Alexandria, who died A.D. 265, though he admitted the *Apocalypse* to be above his comprehension and the work of an inspired man, gave various reasons for supposing it not to be written by the apostle John. These reasons were subsequently reproduced in substance by Erasmus, as we shall presently mention; and, indeed, every later opposer has repeated the same arguments.

The synod of Toledo, A.D. 633, speaks of 'many who do not receive the authority of the *Apocalypse*, and despise it so much, that they do not preach it in the church of God;' but with these despisers the synod makes short work, saying, 'the authority of many councils, and the decrees of the Roman bishops, prescribe that it is of John the Evangelist, and appoint that it is to be received among the Divine books.' 'If, henceforth, any one does not receive it, or does not preach from it, between Easter and Pentecost, at the time of mass, he shall have the sentence of excommunication.'—(Harduin, *Act. Con.* tom. iii., 584.)

The synod indicates the then prevailing opinion which continued undisturbed during the middle ages. Isidorus of Seville, who died 636, described in his work, *De Officiis Ecclesiasticis*, the *New Testament* canon exactly as the church considered it henceforth to be established and closed.

According to Isidorus, the *Apocalypse* concludes, as being truly apostolical, the whole canon. But it is remarkable, that the *Decretum Aquisgranense* by Charlemagne, A.D. 789, cap. 20, decrees, that according to the synod of Laodicea only canonical writings should be read in the church. The canon of Laodicea is added, in which the *Apocalypse* is omitted. *Corpus Juris Germ.* ed. Walter, tom. ii. p. 1, p. 77, seq. But it appears from Augustus *Denkwürdigkeiten aus der Christlichen Archäologie*, b. vi. p. 113, &c., that the *Apocalypse* continued publicly to be read in the Western church.

During the middle ages, the antieatholic sects, as well as orthodox divines, appealed to the canonical authority of the *Apocalypse*, although they differed widely in its interpretation, but with the Reformation began another period in the history of the *Apocalypse*.

Erasmus (*In Annotationibus in Novum Testamentum*, 1516) reminded his contemporaries of the former doubts, and repeated them more fully in the edition of 1527. He states that from the title *Johannes Theologus*, the frequent repetition of John's name, the difference of style, and the manner in which the author speaks of his own visions less modestly than Paul, (2 Cor. xii. 1, seq.) who relates them as if they happened to another, we might feel inclined to ascribe the Revelations not to John the Evangelist, if the general consent, and especially the authority of the church, had not already settled its genuineness. Nevertheless he relates, apparently with predilection, the opinions of Dionysius, and the uncertainty of Eusebius whether it belonged to the *Homologoumena* (the admitted), or the *Antilegomena* (the disputed).

What Erasmus had cautiously whispered into the ears of the learned, Carlstadt and Luther proclaimed boldly to the people. Carlstadt, in his book *Welche Bücher Biblisch Sünd*, 1520, p. 4, divides the *New Testament* into three classes, the last of which contains the Epistle to the Hebrews, the two Epistles of Peter, the three Epistles of John, the Epistle of Jude, and the *Apocalypse*; and he adds, that, among all books of the third order, the *Apocalypse* is the least valuable, because, he says, it was not received in the days of Hieronymus by all Christians; secondly, the title is not *Apocalypsis of John the Apostle*, but of *John the Theologian*. Thirdly, its style and manner differ from those of John the Apostle. 'But,' says Carlstadt, 'I will this and the other books of the third order not reject, but only point out the difference.' In the Preface to the *Apocalypse* in the first edition of his *German Testament*, A.D. 1522, Luther writes: 'In this book of the Revelation I leave every one to his own opinion, and I will bind none by my view and conclusion. I say only what I feel. In this book more than one thing is wanting, so that I consider it to be neither apostolical nor prophetic. First, the Apostles deal not in visions, but prophesy in clear and dry words, as do Peter, Paul, and Christ himself in the Gospel. It befits the apostolic office to speak clearly, without imagery, about Christ and his doing. But there is no prophet in the *Old Testament*, much less in the *New*, who so entirely deals in visions and imagery; so that I deem it only equal to the fourth book of Ezra, and indeed cannot perceive that it was dictated by the Holy Ghost.'

'It appears too much that the author should recommend his own in preference to other holy books, which are much more important, and that he commands and threatens God would take from him whosoever would take anything from the *Apocalypse*; and again, that they should be blessed who keep what is written therein, although nobody knows what it is, much less can he keep it, and it is just as much as if we had it not. There are also many nobler books which we have to keep. Many of the fathers have in former days rejected this; and although St. Hieronymus, with high-sounding words, asserts that it is beyond all praise, and contains as many secrets as words: he cannot prove it, and various passages of his praise are too mild (namely, towards this book). Finally, everybody may think of it what his own spirit tells him (what he pleases). My spirit cannot accommodate itself to this book, and it is sufficient cause for me not highly to esteem it, that Christ is neither taught nor known in it, which, before all things, an apostle ought to do, because he says (Acts i.), "Ye shall be my witnesses." Therefore I adhere to those books which give me Christ clearly and purely.' This preface of Luther was repeated in his editions until A.D. 1531.

His opinions of the reformer influenced the Lutheran

theology during the sixteenth century so much, that it became habitual to divide the *New Testament* into canonical and apocryphal books. To the canonical books only was ascribed an absolute authority in matters of faith; and the Apocrypha, to which the *Apocalypse* was referred, were considered as subsidiary sources of information. (Compare Oeder, *Christlich freye Untersuchung*, p. 51, 313; Hartwig's *Apologie der Apokalypse*, th. iii. p. 35, 48; Storr's *Neue Apologie*, p. 7, seq.; and especially Bleek's *Einleitung in den Brief an die Hebräer*, p. 449, &c.)

In the disputation at Bern, A.D. 1528, one of the Roman Catholic interlocutors declared that the *Apocalypse* was written by St. John, and that wherever the Christian church caused the biblical books to be printed, the *Apocalypse* was among them; but Zwingli replied, it could not be proved historically that the *Apocalypse* was written by the Evangelist. Another Roman Catholic interlocutor complained that the Protestants would not admit the testimonies from the books of Tobit, Baruch, Maccabees, and of the *Apocalypse*; to whom Oecolampadius and Zwingli replied, that the Protestants did not absolutely reject the Apocrypha, but they could not admit their authority in the important matter of faith, and they had not been generally received by the old church. (See Zwingli's *Werke von Schuler und Schultheiss*, 2 b. i. Abth. p. 87, 169, &c.) Thus it appears that Zwingli, Oecolampadius, and Bucer, who was present at the disputation of Bern, agreed with Luther and his followers in their estimate of the *Apocalypse*.

The reformers of Geneva, Calvin and Beza, seem to be more favourable to the *Apocalypse*. They quote it often without mentioning the Lutheran classification of canonical and apocryphal books of the *New Testament*. Calvin uses in his *Institutio Religi. Christianæ*, the *Apocalypse* as canonical and apostolical, but does not interpret it in his *Commentarii*, and thus obtained the often-echoed praise of Scaliger: 'Calvin was wise not to write on the *Apocalypse*.' Beza defends, in his *Prolegomena to the New Testament*, its authenticity against Erasmus, but adds, that if it were not of St. John, he would ascribe it to St. Mark, on account of the similarity of style. On the authority of these reformers the *Apocalypse* was sanctioned as genuine in the *Confessio Helvetica Posterior*, the *Thirty-nine Articles of the Church of England*, the *Confessio Gallica*, and *Conf. Belgica*, and zealously expounded by Theodori Bibliandri (*Explicatio Apocalypses*, Basle, 1549, p. 8,) and by Artopæus, (Francfurt 1549,) and Heinrich Bullinger, who defends it against Erasmus and Luther (*Cent Sermons sur l'Apocalypse*, Genève, 1565). Hyperius (in his *Methodus Theologie*, Basle, 1574, p. 48,) did not conceal that its authenticity had been doubted by some, but he declares it to be canonical on the authority of the most ancient fathers. So the theory and practice of the so-called reformed (Calvinistic) church were, in the sixteenth century, decidedly opposed to those of the Lutheran.

The Socinians leaned more towards the reformed than to the Lutheran view. Faustus Socinus (*De Auctoritate Scripturæ Sacre*, opp. i. 268) declares the *Apocalypse* to be genuine.

Towards the middle of the eighteenth century, the doubts about the authenticity of the *Apocalypse* were revived first in England by a Deist, namely, the unknown translator of *The New Testament in Greek and English, containing the Original Text, &c.*, dedicated to the Lord Chancellor, Peter King, London, 1729; and with more penetration by the anonymous author of the *Discourse, Historical and Critical, on the Revelation ascribed to St. John*. It is now known that this *Discourse* was written by Firmin Abauzit, the famous librarian at Geneva, a friend of Bayle and Newton, at the request of W. Burnet. It was originally written in French, under the title *Discours sur l'Apocalypse*. The original was printed, contrary to the wish of Abauzit, (who died in 1767,) in the edition of his *Ouvrages Diverses*, London, 1770. Abauzit's essay gave a new impulse to these critical investigations; and it induced Dr. Leonhard Twells to write his defence of the *Apocalypse* in the third part of his *Critical Examination of the late Text and Version of the New Testament in Greek and English*, 1732; which contains the first essay of a solid defence of the *Apocalypse* by internal and external arguments. T. C. Wolf inserted an abridged translation of this work in his *Curæ Phil. & Crit.*, vol. v., p. 387. The excellent work of Twells, which silenced the adversaries of the *Apocalypse* in England, became known in Germany, where, after thirty years, the combat was renewed.

There was a time when the philologists of Germany generally did not recognize the æsthetical value of the Apocalypse, being influenced by the opinions of Oeder, Semler, and his followers. Herder and Eichhorn, equally learned, without any predilection for orthodoxy, but with more tact than Semler and his school, showed that the despisers of the Apocalypse had only manifested their own want of taste, when they denied the æsthetical value of the Apocalypse; and thus, without being orthodox, Eichhorn facilitated a decision favourable to orthodoxy. Herder observed, that every Christian poet who had a spark of real poetry enjoyed the Apocalypse; that the best hymns of the middle ages, on Jesus, Mary, the church, and the kingdom of God, are crowned with apocalyptic flowers: that Dante, Petrarch, and Milton were imitators of the Apocalypse.

There is in the Apocalypse neither the plastic beauty of the antique, nor the picturesque beauty of our western modern poetry: the oriental poetry loves immensity. The apocalyptic imagination opens heaven and hell, and, rising high above human and terrestrial forms, breaks through the limits of humanity and temporal existence. It calls down the heavenly Jerusalem, dimly shadowed forth by the things temporal. The poetry of the Apocalypse is that of infinity, of destruction, and of endless power.

Bretschneider, Bleek, De Wette, Ewald, Scholt, Lücke, are living divines who have written against the authenticity of the Apocalypse. Their works contain further developments of the old arguments of Dionysius.

Hinlein, Schmidt, Kleuker, Heng, Eichhorn, Feilmoser, Lange, Bertholdt, Guericke, Olshausen, are modern defenders of the authenticity of the Apocalypse: to whom we may add among the English, Lardner and his epitomizers, Dean Woodhouse, the Rev. Hartwell Horne, and others.

The most recent German opposers fairly grant, that the external testimonies are decidedly in favour of the authenticity, but they assert that these testimonies are overcome by the internal philological character of the work.

The Apocalypse has been attacked and defended with greater zeal than any part of the New Testament, because its contents excite a very strong interest either in favour or against this conclusion of the whole Bible. The fundamental idea of the Apocalypse, which Luther and other opposers of the Revelations did not understand, is the following: As Plato, in his books *ἑπὶ Πολιτικῆς*, considers the state to be an exact transcript of individual man, so St. John, taking yet a higher step, tells us in the Apocalypse that similar events, which happen in the life of individuals, shall also take place in the infinity of the whole universe.

As the redemption of Christ saves the whole man,—spirit, soul, and body,—so Jesus Christ saves also the universe from sin and consequent perdition. The Apocalypse teaches by a sublime imagery, what the other apostolical writings more obscurely indicate, namely, that there shall be a period in which the spirit of the Lord shall not only operate in secret by governing the hearts of believers, but a period in which it shall entirely conquer, prevailing against all opposition, and shall finally establish a kingdom of universal peace and justice here on earth.

The leading idea, then, of the Apocalypse consists in the complete victory of what is good, and of Paradise regained, or re-established on earth.

APOCALYPTIC KNIGHTS (Cavalieri dell' Apocalisse) were a secret society, formed A.D. 1693, professedly for the defence of the Roman Catholic church against Antichrist. The founder of the Apocalyptic order was Agostino Gabrino, the son of a merchant at Breseia. When, on Palm Sunday, 1693, in the church of St. Peter at Rome, the antiphony of Ps. xxiv was sung: '*Quis est iste rex glorie?*' 'Who is that king of glory?' Agostino Gabrino stepped forward with a drawn sword among the ecclesiastics, crying out, '*Ego sum rex glorie.*' 'I am king of glory.' In a similar manner he disturbed public worship in the church of St. Salvatore, and was, therefore, confined in a madhouse. A woodcuter belonging to the Apocalyptic knights laid information before the Inquisition against his order; by this tribunal the order was suppressed in 1694, and the knights confined in prison. About eighty knights, most of whom were tradesmen and labourers, wore constantly a sword at their side, even during menial occupations, and a star upon their breast. This star had seven corners and a tail, and was surrounded by a golden thread, which circle represented the terraqueous globe. The tail of the star

represented the sword seen by St. John in the Apocalypse. This order has been accused of an intended rebellion against the papal government and the higher ranks. Agostino Gabrino, called monarch of the Holy Trinity, intended to introduce polygamy, and his knights were to marry pure virgins only. The history even of such a set of madmen is not without its uses: ignorance and fanaticism will, in all ages, produce the same fruits. (See Teuzel's *Monatliche Unterredungen* for the year 1694, pp. 672-677, and of 1697, p. 883, &c.; Ersch and Gruber's *Encyc.*)

APOCRYPHA (ἀποκρυφοί βιβλίοι) are such books as contain secrets and are kept in secret, from ἀποκρύπτω, to conceal; consequently the term referred to those writings of the Gnostics and other sects which contained the knowledge of those mysteries which were communicated to their partizans only. These books are now known under the name of *pseudepigraphi*, (that is, 'books with false titles,') as the books of Adam, Enoch, the three patriarchs, &c. These volumes formed a kind of heretical canon in opposition to the orthodox canon, and hence arose the signification of the name Apocrypha, which now means *not canonical*, or not belonging to those writings which form the canon of the Holy Scriptures. [See CANON.]

The name *Apocrypha* is especially given to those additions which were introduced into the Septuagint translation of the Old Testament, from whence they were transferred into the Vulgate and many subsequent translations. The reformers separated the Apocrypha from the Old Testament, and Luther placed them between the Old and the New Testaments, under the title of Apocrypha, or books which are not to be esteemed equal to the Holy Scriptures, but are still profitable to the reader. In opposition to the reformers, the Apocrypha were declared to be canonical by the Council of Trent. Hence all translations which follow the Vulgate have the Apocrypha interspersed with the other writings which are admitted by all Christians to be canonical. The Bibles published by Protestants on the Continent place separately the additions to Esdras; the book of Tobit; Judith; rest of Esther; Wisdom of Solomon; Ecclesiasticus; Baruch, with the epistle of Jeremiah; the Song of the Three Children; Susanna; Bel and the Dragon; the Prayer of Manasse; the books of the Maccabees. These works, which are principally called the Apocrypha, will be noticed in separate articles. About the year 1821, a debate arose in the British and Foreign Bible Society about the propriety of printing the Apocrypha together with the Holy Scriptures. About 1826, it was decided that the Apocrypha should not be circulated by the British and Foreign Bible Society. Nevertheless the disputes of the two opposite parties were continued for several succeeding years, and many pamphlets were published by both parties, until the apocryphalists were finally defeated by the anti-apocryphalists. Besides the Apocrypha, which form a kind of appendix to the Old Testament and belong to the literature of the later Jews, there are a number of other apocryphal writings of the Old and New Testaments, which have been collected by Fabricius in the *Codex Pseudepigraphus Veteris Testamenti*, and the *Codex Apocryphus Novi Testamenti*, and more completely by Thilo in the *Codex Apocryphus Novi Testamenti*, Lipsie, 1832. Most of the apocryphal additions to the New Testament have been collected and published in an English translation by Hone.

APOCYNEÆ, a natural order of plants, belonging to the monopetalous subdivision of the dicotyledonous class. Among these they are known by their flowers being perfectly symmetrical, the segments of the corolla all twisted one way, like a Catherine-wheel, five distinct stamens, a superior ovary which, when ripening, divides into two parts, which diverge from each other at right angles, and by their stems yielding, when wounded, a copious milk. The latter is generally poisonous, and that character is to be taken as general in the order, which abounds in plants the action of which upon the human body is more or less violent; among these, the Tanghin poison of Madagascar (see TANGHINIA) and the Nux vomica (see STRYCHNOS) are remarkable instances. Notwithstanding this, some of the species are not unwholesome; as the hya hya, or milk-tree of Demerara, and the cream fruit of Sierra Leone; caoutchouc is yielded in abundance by Valkea and Ureola elastica; and the bark of several species is a powerful febrifuge. Considering, however, the great prevalence of poisonous qualities in the order, drugs obtained from any of its species

should be administered with very great caution, until it has been satisfactorily ascertained that they may be employed without danger. The order *Apocynæ* is only distinguishable from *Asclepiadæ* by the stamens being distinct from the pistillum, and by the pollen not being contained in little waxy bags.

A'PODES, in zoology, an order of fishes, including, according to the Linnæan system, all those which want the ventral fins, but restricted by Baron Cuvier to those which, besides possessing this character, are likewise malacopterygious. In the latter sense, the apodal fishes compose a small natural family, almost restricted to the great genus *Muraena*, and of which the common eel offers a good and familiar example.

APOGEE, from ἀπό, *from*, and γῆ, *the earth*, an astronomical term applied to the apparent orbits of the sun and moon, signifying the points of those orbits which are at the greatest distance from the earth. It is opposed to **PERIGEE**, which means the point nearest to the earth. For general considerations connected with this term, see **APHELION**, substituting the earth in place of the sun.

The sun is in its apogee when the earth is in its aphelion, and the motion of the solar apogee is the same as that of the earth's aphelion. The motion of the lunar apogee is more complicated. At new or full moon, its longitude is increasing: at the quarters it is decreasing. But the increase, on the whole, is greater than the decrease: so that, on the average, the apogee increases its longitude daily by 6' 11", or describes a whole revolution in about nine years.* In the *Nautical Almanac* will be found the time when the moon is in her apogee and perigee for every month. For example, we find that in January, 1834, the moon is in apogee at fourteen days eighteen hours (meaning eighteen hours after noon on the 14th, or six in the morning on the 15th, civil reckoning). On referring to the moon's right ascension for that time, we find it twenty-three hours forty-four minutes. For further details, see **LUNAR THEORY**.

APOLDA, a town in the grand duchy of Saxe-Weimar-Eisenach, about eight miles north of the University of Jena, and forty miles south-west of Leipzig, lying upon the river Ilm. It has a manufactory of woollens and kerseymeres, and a very large one of stockings, of which it produces about 30,000 dozen pairs a-year; linens, brandy, and spirits, are also made in the town. It has two foundries for bells. Population, 3300.

APOLLINARIS, **C. SULPICIUS**, a grammarian who taught under the reign of the Antonines in the second century, at Rome. Helvinus Pertinax was his most famous disciple, and himself taught grammar till he commenced that career which led him to the throne of the Cæsars. (J. Capitol. *Vit. Pertinacis*, c. 1; *Script. Hist. Aug.*) Aulus Gellius, another distinguished disciple, mentions his master repeatedly, and praises his learning, his moderation in refuting, and his urbanity in teaching. (*Noct. Att.* l. iii. 6; xiii. 17, 19; xviii. 4; xx. 6.) The short metrical arguments of the *Comedies of Terence* are attributed to Apollinaris, in a codex in *Epist. Politiani*. Donatus quotes, in his *Life of Virgil*, an epigram of six lines on the *Æneid*, under the name of Sulpicius of Carthage, who is considered to be the same person as C. Sulpicius Apollinaris.

APOLLINARIS, or **APOLLINARIUS** (Ἀπολλινάριος), a native of Alexandria, taught grammar at Berytus, a town on the coast of Phœnicia, and afterwards in Laodicea of the same country. Apollinaris married and became presbyter of Laodicea. His son, likewise called Apollinaris, was one of the greatest orators, poets, and philosophers of his age. Apollinaris, the younger, became professor of eloquence at Laodicea before A.D. 335, and afterwards lecturer of the Christian congregation. Both father and son continued their intercourse with learned heathens after their ordination. They were friends of Libanius, and attended the lectures of Epiphanius the sophist, who taught at Laodicea, and afterwards in Athens. On this account, and especially because they were present when Epiphanius recited a poem in praise of Bacchus, they were excommunicated by Theodotus, bishop of Laodicea; but again, on doing penance, admitted into church-fellowship. Georgios, the successor of Theodotus, A.D. 350, being an Arian, banished them, either on account of their continued intercourse with Epiphanius, or on account of their adherence to the Nicene Creed and the friendship of the younger Apollinaris for Athanasius. This friendship had commenced A.D. 349, at the time that Athanasius passed through Laodicea. When

Julian forbade the Christians to interpret the Greek classics, the Apollinaris, father and son, composed imitations for the use of schools. The father wrote a grammar for Christians. Socrates (*Hist. Eccles.* iii. 16) attributes to the father some epic poems and tragedies, founded on the history of the Old Testament; but Sozomenus (*Hist. Eccles.* v. 18) ascribes these productions to the son, who transformed also the New Testament into the manner and style of Platonic dialogues. After the death of Julian, the classics were read again, and the imitations of Apollinaris forgotten.

The younger Apollinaris is mentioned (in *Athanas. Ep. ad Antiochenos*, tom. i.; *Opp. ed. Montfaucon*, vol. ii., p. 776) as orthodox bishop of Laodicea A.D. 362, whilst Pelagius was bishop of the Arians in that city. He was esteemed, and had some epistolary correspondence with Athanasius, Basilus Magnus, and other great men of that age, who continued to speak respectfully of his merits, even after he was suspected of heresy. Apollinaris distinguished himself especially by polemical and exegetical writings; for instance, by his work on Truth, against the Emperor Julian and the heathen philosophers. Apollinaris' thirty books against Porphyrius, against the Manichæans, Arians, Marcellus, and others, were highly esteemed. Hieronymus himself, during his residence at Antiochia, A.D. 373 and 374, enjoyed the exegetical instructions of Apollinaris, then bishop of the neighbouring Laodicea. The interpretations of Apollinaris, quoted in the commentaries of Hieronymus, were peculiarly valuable in those days on account of his knowledge of the Hebrew tongue. Basilus Magnus mentions a work of Apollinaris on the Holy Ghost; and from the works of Gregorius Nazianzenus we learn that his hymns and psalms were often sung in Christian congregations, and much admired. In the year 1552 was published at Paris, a *Metaphrasis Psalmorum* of Apollinaris; and re-edited by Sylburg at Heidelberg, in 1596; this, and the tragedy on the suffering of Christ, in the Works of Gregorius Nazianzenus, were ascribed to Apollinaris, but appear to some critics to be unworthy of his talents.

In the latter part of his life, Apollinaris, who had strenuously defended the Athanasian doctrine of the Trinity, himself incurred the reproach of heresy, because he taught that the divine *logos* occupied in the person of Christ the place of the human soul. According to him, Christ was (ἐσαρκος) *incarnate*, but not (ἐμψυχος) *insoled*. His disciples, who were very numerous, were called Apollinarists. His heresy became generally known A.D. 371. The accusation of Socrates, Sozomenos, and Theodoret, against the character of Apollinaris, and the low notions which are said to have led him to embrace his peculiar views, are inconsistent both with the chronology and circumstances of his life. Apollinarism was first condemned at the synod held at Rome, A.D. 375, in which the Roman bishop Damasus presided; all mention of the name of Apollinaris was carefully avoided on this occasion. Nevertheless this condemnation induced Apollinaris to form a separate congregation, over which he ordained the presbyter Vitalis as bishop. Hence the Apollinarists are also called Vitalians. They are also called Dimacrites, because they were accused of dividing the nature of Christ into two parts.

Before the death of Apollinaris, which happened between A.D. 382—392, the Apollinarists formed in Syria and the adjacent countries several separate congregations having their own bishops. After his death, the Apollinarists were divided into two parties, one of which, under Polemo, or Polemius, and Timotheus, pretended that the divinity and the body of Christ were transformed into one substance, and, consequently, that the flesh was to be worshipped as well as the *logos*; these were called Polemians and Synousiasts, and also *sarkolatæ* (σαρκολάται; flesh-worshippers); in retaliation, they called the orthodox *anthropolatæ*, or *men-worshippers*. The other party, which adhered to the original doctrine of Apollinaris, were called *Valentinians*.

By imperial command, the public worship of the Apollinarists was impeded A.D. 388 and 397, and A.D. 428 in all towns entirely prohibited. The sects of the Apollinarists assimilated, in the fifth century, partly to the orthodox, and partly to the Monophysites (see **MONOPHYSITES**).

APOLLO, one of the principal gods of the Grecian heaven, also named Phœbus, and in Homer and Hesiod most commonly called Phœbus Apollo (Φαῖδος Ἀπόλλων). He was the presiding deity of archery, prophecy, and music, and in later times of the sun: but in the early poets above mentioned, the sun (Helios) is a different personage.

of different extraction, the son of Hyperion and Theia. (*Theog.* xviii. 371: see also the adventures of Ulysses in the island of Thrinakia, where the oxen of the sun, not of Apollo, are always spoken of.) According to Herodotus, (ii. 156.) Apollo is the same with the Egyptian Horus, the son of Dionysus and Isis. The Grecian deity was the son of Zeus and Leto (Jupiter and Latona). His mother, when the time of travail drew nigh, wandered through the earth, unable to find a place which would give her rest: for every land, and river, and mountain, feared too much the wrath of Hera, (Juno,) the jealous queen of heaven, to receive her. At last Delos, which was then a floating island driven about the Ægean sea, and called Asteria, afforded her a place of repose, and Apollo was born. He immediately proclaimed his functions to the assembled goddesses who watched his birth. 'The harp, the curved bow be mine, and I will proclaim to men the unerring counsel of Zeus.' (*Hymn to Apollo*, v. 131.) Thenceforward Delos was fixed. Leto promised, in return for the shelter afforded, that her son should honour that humble island above all other places; and it was always held especially sacred to him, and the principal seat of his worship. This story is beautifully related in the Homeric hymn above quoted, and in the Hymn to Delos by Callimachus. Apollo is a leading personage in mythological fiction, and a favourite with the poets, who have engaged him in a great variety of adventures. He was the president and protector of the muses. He is usually represented in the prime of youth, and manly beauty, with long hair, his brows bound with the sacred bay-tree, (*Daphne*), bearing either the lyre, or his peculiar weapon, the bow. In later times he usurped the presidency of the healing art from its earlier deity, Paieon; hence Æsculapius was said to be the son of Apollo. The hawk, the raven, the swan, the grasshopper, (*cicada*), were his favourite animals. His principal temples were at Delos, Delphi, Tenedos, Putara, Claros, &c.; and from these he derives a great variety of distinctive epithets. He has many others peculiar to himself, which principally refer to his skill in archery, or may be interpreted to contain some allusion to the sun; as far-shooting, silver-bowed, golden-haired, golden-sworded, light-producer, &c.

The word Phœbus is apparently connected with a Greek root, signifying *light*; but the origin and meaning of the word Apollo are entirely unknown. In later writers, and by the Latins, who do not appear to have had an antient sun-god of their own, Apollo and the sun are confounded. It is observable, however, that Ovid, in the stories of Phaeton, and Clytie, which have especial reference to him in his character of the sun, always uses the word Sol, not Phœbus or Apollo, except once (ii. v. 399.) at the conclusion of the former (*Met.* ii. l. iv. 190). In Homer and Hesiod, as we have said, the two are clearly distinct. It is maintained, however, by some mythologists, and among them by Buttmann, that originally Apollo and Artemis were the sun and moon, and that those later writers who assigned to those deities the presidency over the two great luminaries, only revived the original belief which had fallen into disuse. Buttmann supports his opinion on the grounds that, 'leaving out Apollo and Artemis, there are two places vacant in the list of deities necessary to be found with a people in the state of culture in which the early Greeks were (for Helios and Selene he regards as deities of a later age); that the attributes of Apollo, his golden-sword, arrows, flowing locks, and the epithets given to him, all apply to the sun, as do those of Artemis to the moon; that they are brother and sister, and the children of Leto, (i. e. Night); the attributes of prophecy and archery, he says, would naturally be given to the sun-god, whose eye surveys every thing, and whose beams penetrate every where; and no more suitable patroness could be chosen by the hunter, who lay at night among the mountains, than the moon-goddess, whose mild radiance guided him through the woods and lawns.' (Keightley's *Mythology*.)

APOLLO BELVEDERE, a celebrated statue of Apollo, found at Capo d'Anzo, in the ruins of antient Antium, about twelve leagues from Rome, towards the end of the fifteenth century. It was purchased by Pope Julius II., before his elevation to the pontificate; and was placed by him in the Belvedere of the Vatican, whence it derives its present name. It has been said to be the work of Agasias the Ephesian, but no certain indications of the sculptor are to be traced. But it is now pretty well proved that it was made under the emperors, and probably by the order of Nero himself. (See

Thiersch, *Ueber die Epochen der bildenden Kunst*, &c., p. 312, &c., second edition, 1829, p. 459.)

This statue, one of the finest specimens of sculpture extant, is a standing figure, more than seven feet high. It represents the god naked, except the cloak which is fastened round his neck, and hangs over the extended left arm. The left hand and the right fore-arm were lost, and were restored by Giovanni Angelo da Montorsoli, a pupil of Michael Angelo: so that the original action of the figure can only be conjectured. It was supposed, however, to represent the god at the moment of having discharged an arrow at the serpent Python, watching the effect of his weapon: and accordingly, in the restoration, part of a bow was placed in the left hand. A serpent, the emblem of the healing art, is fixed on the stump of a tree, which gives stability to the figure. We quote Lord Byron's fine description of it.

The lord of the unerring bow,
The god of life, and poesy, and light,
The sun in human limbs arrayed, and brow
All radiant from his triumph in the fight;
The shaft has just been shot—the arrow bright
With an immortal's vengeance; in his eye
And nostril beautiful disdain, and might,
And majesty, flash their full lightnings by,
Developing in that one glance the Deity.

Child's Harold, iv. 161.

(See also the Homeric Hymn to Apollo, v. 357, &c.; and *Pen. Mag.*, vol. i., p. 362.)

APOLLODORUS, a celebrated grammarian of Athens, of whom an account is given by Suidas. He was a pupil of Aristarchus. Of his voluminous writings, only three books of his *Bibliotheca*, a mythological work, have come down to us. He wrote a chronicle, or history in Iambic verse, extending from the destruction of Troy (B.C. 1184) to his own times (about B.C. 141). (See *Scymnus Chius*, v. 19-49.) Among his other writings was a treatise on the Gods, on the Mimi of Sophron, and on other subjects. Scipio Tetti, a Neapolitan, has written a treatise concerning the persons of different professions and various merit, who have borne this name. The first edition of Apollodorus was by B. Ægius of Spoleto, 1555, 8vo., Rome. The best editions are by Heyne, 1782-1783, four volumes, and 1802, two volumes octavo; and that by Clavier, Paris, 1805, two volumes octavo, with a French translation. Dr. Thomas Gale published a bad edition in 1675.

APOLLODORUS, a celebrated architect in the reigns of Trajan and Hadrian, was born at Damascus. The magnificent stone bridge built over the Danube, A.D. 104, by order of Trajan, was executed under his direction. The remains of this bridge still exist near the junction of the Aluta or Alt and the Danube. He is also said to have been the architect of the Forum Trajanum, in which the column of Trajan stands, and to have built a library, a music-hall (Odeum), baths, and aqueducts. It is said that Hadrian put him to death on some false and frivolous pretence. Apollodorus is the author of a work on besieging towns (*Πολιορκητικά*) printed in the collection of Thevenot.

APOLLODORUS, an eminent Athenian painter, who lived about four centuries B.C. (See *Plin. Nat. Hist.* xxxv. 9.)

APOLLO/NICON, the name given to a chamber organ of vast power, supplied with both keys and barrels, built by Messrs. Flight and Robson, of St. Martin's Lane, and first exhibited by them at their manufactory, in 1817. The word is formed from *Ἀπὸλλων* (*Apollon*), and a Greek termination, *ikon*, *icon*, of common occurrence. The denomination does not appear to us the best that might have been suggested; but, being of Greek origin, was probably thought likely to captivate the multitude, who still entertain a lurking respect for whatever is conveyed through the medium of an antient, to them unknown, language.

The *Apollonicon* is either self-acting, by means of complicated, but very ingenious machinery, or may be played on in the usual manner, by means of keys. The music, when the organ is worked by machinery, is *pinned* on three cylinders or barrels, of about two feet eight inches long, each acting on a distinct division of the instrument; and these, in their revolution, not only admit air to the pipes, but actually regulate and work the stops, forming, by an instantaneous action, all the necessary combinations. The key-boards are five in number; the central and largest comprising five octaves, and the smaller ones, of which two are placed on each side the larger, two octaves each. To the central key-board are attached a swell and some compound

pedals, enabling the performer to produce all the changes and variety of effect that the music may require. There is also a key-board, comprising two octaves of other pedals, operating on the largest pipes of the instrument. 'These six key-boards are detached from the body of the organ, so that the performers sit with their backs to the instrument, and, consequently, with their faces to the audience.' There are 1700 pipes, the largest twenty-four feet in length, and one foot eleven inches in aperture, sounding the G, two octaves below the first line of the base, the highest giving the A in altissimo, two octaves above the second space in the treble. The number of stops is forty-five, and these in their combinations afford very good imitations of the various wind instruments used in an orchestra. Two drums are also inclosed in the case, and struck by a curious contrivance in the machinery. A tolerably correct estimate of the capabilities of this instrument may be made, when it is stated that it performs Mozart's Overtures to the *Zauberflöte*, *Figaro*, and *Idomeneo*; Beethoven's to *Prometheus*; Weber's to the *Freischütz* and *Oberon*; Cherubini's to *Amorcen*, &c., without omitting a single note of the score, and with all the fortes and pianos, the crescendos and diminuendos, as directed by the composers, with an accuracy that no band can possibly exceed, and very few can reasonably hope to rival. The *Apollonicon* was five years in building, and at an expense of about ten thousand pounds.

APOLLONIUS DYSCOLUS, or ALEXANDRINUS MINOR, a grammarian, who was born at Alexandria in the second century of the Christian era, and of whose private history we only know a few facts gleaned from Suidas and from a sketch of his life by an anonymous writer, prefixed to the edition published by Sylburgius of the work of Apollonius *On Syntax*. He was the son of Mneitheus and Ariadne, and is said to have been so poor that he was unable to afford money sufficient even to purchase paper. It was probably this state of poverty which had an effect on his temper, and procured him the name of Dyscolus, or the morose. This second appellation was intended to distinguish him from Apollonius Rhodius, who is sometimes called Alexandrinus Major. He was the author of many works; he was called by Priscian 'Princeps Grammaticorum,' and afforded to that grammarian many hints for his *Latin Grammar*. Of his four remaining works the chief is a *Treatise on Syntax*, in four books, the first edition of which is by Aldus, 1495, Venice. An improved edition was made by Sylburgius, with a Latin translation of Em. Portus, 1590; the last is by Bekker, Berlin, 1817. At the end of the *Treatise on Greek Dialects*, by Maittaire, Hague, 1718, Lips. 1807, there are some extracts of the Grammar of Apollonius, which were procured by Vossius from a manuscript of the Royal Library of Paris. There is also a work attributed to him, *ἱστορία θαυμάσια, Wonderful Stories*, the best edition of which is by Meursius, Lugd. Bat. 1620; but it is not without reason that many have doubted whether he could be justly considered the author. It has been published also by Teucher, Lips. 1792.

APOLLONIUS, (PERGÆUS,) after Archimedes, the most original and profound of all the Greek geometers, was born at Perga in Pamphylia, while Ptolemy III., commonly called Energetes, was king of Egypt. Ptolemy began his reign B.C. 247.

Apollonius was in the zenith of his fame about the end of the reign of Ptolemy (IV.) Philopator, who died B.C. 205. Apollonius and Hannibal were nearly contemporary both as to birth and achievements in their different lines. Archimedes died B.C. 212, at which time Apollonius was living; it is not known when the latter died.

The life of Apollonius was passed at Alexandria, in the school of the successors of Euclid, under whom he studied. Of its details we know nothing, except that Pappus (who lived, however, as long after him as the fourth century) represents him as vain and envious: that Heraclius, who wrote the life of Archimedes, asserts that he surreptitiously obtained the discoveries of the latter, and published them as his own: and that he had a son of the same name as himself. With respect to the charge of plagiarism, Eutocius, his commentator, (about A.D. 540,) who cites the charge, answers it sufficiently by saying, that it was well known that neither Archimedes nor Apollonius pretended to be the first investigators of the conic sections. Bayle objects to this defence, and finds a better one in the silence of Pappus on the subject, who, though disposed, as we have seen, not to think too favourably of the merits of Apollonius, does not

take notice of the charge. To this we would add that Vossius (though Bayle takes it differently) understands Pappus as saying, that Apollonius wrote commentaries upon the four books of conic sections written by Euclid, and added four more to them; thus recognizing him as the author of that part of the work on which, as we shall see, his fame principally depends. We shall also, in the proper place, show grounds for doubting the assertion of Pappus with respect to the books of Euclid.

Of the most interesting part of an eminent man,—his opinions on disputed subjects,—we know but little in the case of Apollonius. Gassendi, in his life of Copernicus, mentions an opinion attributed by the latter to the Grecian geometer, and which is said to have been also that of Philolaus, that the sun and moon only moved round the earth, but all the other planets round the sun. This, so far as appearances only are concerned, is a sufficient explanation of all the phenomena: and, next to the system now received, is the soundest of hypotheses. We cannot find any other authority for attributing this opinion to Apollonius, except Weidler in his *Historia Astronomie*, who however cites Gassendi as his authority. But Apollonius certainly paid attention, at least, to the then received system, since known by the name of the Ptolemaic, for Ptolemy has preserved some theorems of his on the method of finding the stationary points of the planets, supposed to move in epicycles. Proclus, in his commentary on Euclid, mentions that Apollonius attempted to prove the axioms, and cites his investigation of the theorem, that things which are equal to the same are equal to one another, in which, as may be supposed, propositions are assumed not more obvious than the theorem itself. The same author gives a definition of an angle which he attributes to Apollonius, but which we confess ourselves unable to understand. Vitruvius cites Apollonius as the inventor of a species of clock which he terms *pharetra*.

The great work of Apollonius which now remains is seven books of his treatise on conic sections, of which we shall presently speak. But besides this, he is known to have written treatises, according to Pappus, *De Rationis Sectione*, *De Spatii Sectione*, *De Sectione determinatâ*, *De Tactionibus*, *De Inclinationibus*, *De planis Locis*, and according to Proclus, *De Cockerâ*, and *De perturbatis Rationibus*. Most of these names would require circumlocution to make them more intelligible in English, and we therefore cite them as they are usually referred to. Of these, the first only is known to us, having been found in Arabic, and published in Latin by Halley in 1708, with an attempt to restore the second. But Mersenne, cited by Vossius, says he read, in an Arabian author, Aben Eddin, an assertion that all the works of Apollonius, more in number than those mentioned by Pappus, were in Arabic at the beginning of the eleventh century. This point is even yet worth the attention of those who pursue oriental literature.

About the end of the sixteenth century, it was a very common exercise of mathematical ingenuity to endeavour to restore these and other lost treatises, that is, from the fullest notion which could be gathered, to guess at the propositions which they might have contained. Such attempts gave rise to the *Apollonius Gallus* of Vieta, the *Apollonius Batavus* of Snellius, and other works of Maurolico, Ghetaldi, Adrianus Romanus, Fermat, Schooten, Anderson, Halley, R. Simson, and others.

The conic sections of Apollonius are in seven books, the first four of which are extant in Greek, with the commentary of Eutocius of Ascalon, above mentioned. The three next were supposed to be lost, till the middle of the seventeenth century, when James Golius, a celebrated orientalist, professor of Leyden, returned from the East, with the whole seven books in Arabic. Some delay took place in their translation and publication, during which, in 1658, Borelli accidentally discovered an Arabic manuscript in the Medici library at Florence, of the same seven books. It does not a little serve to illustrate the use made of public libraries, that while one author after another had for years expressed regret at the loss of the last four books, three of them should be lying in one of the most celebrated libraries in Europe, in the heart of a capital city, with an Italian title-page. Borelli, and Abraham Echellensis, an oriental professor at Rome, translated from the Arabic, and published their version in 1661. At the time of the discovery, Viviani was engaged in restoring the lost books, and when it was made known, he prevailed on the Grand Duke of Tuscany to mark

all his papers, and to order Borrelli to keep the contents of the new books secret. The work of Viviani, well known as an acute and accomplished mathematician, was found (see Montucla, i., 250) to fall short of that of Apollonius on several important points, though, as might be expected, the views of the Italian of the seventeenth century were more extensive in many cases than those of the Greek. The eighth book was still wanting, and a note to the version imported by Golius informed the reader that it had never been found, even by the Arabs, in the Greek. But when the Oxford press, at the commencement of the last century, was employed upon the magnificent versions of the Greek geometers, which are still the best in public use, Dr. Aldrich, observing that the preliminary Lemmas of Pappus to the seventh book were asserted to belong to the eighth, and also that the latter appeared, from the words of Apollonius himself in his introduction, to be a continuation of the former, proposed to Halley that he should endeavour with these lights to re-establish the missing book. Halley was then employed in completing the edition of the work, which the death of Dr. Gregory had interrupted, and he acceded to the suggestion. The whole appeared at Oxford, in 1710, with the commentary of Eutocius, the Lemmas of Pappus, and in addition, the work of Serenus on the same subject. This is the only edition of the Greek text.

The contents of the work are thus briefly described by Apollonius, of whose words we give a free translation. 'The first four books are elementary: the first contains the generation of the three sections of the cone, and of the sections which are styled opposite, and their principal distinctive properties, which have been treated by us more fully and generally than by any of our predecessors. The second book contains the properties of the diameters, and axes, as well as of the asymptotes, and other matters of general utility: you will hence see what I have called diameters, and what axes. The third book contains many and wonderful theorems, which are useful in the composition of solid loci, of which the majority are both new and beautiful. The fourth book shows in what manner sections of a cone, or of opposite cones, may cut one another, and the circumference of a circle, on the whole of which nothing has been delivered by those who went before us. The remaining four books treat of the higher part of the science: the fifth, on maxima and minima: the sixth, on equal and similar sections: the seventh, on dioristic theorems, or theorems useful in the solution of problems: and the eighth, on the problems thus solved.'

Apollonius was the first who used the words *ellipse* and *hyperbola*, of which Archimedes does not take notice, though he uses the term *parabola*. He also, as we see above, first distinguishes the *diameters* of the section from the *axes*. It was, moreover, in his time, and perhaps first by himself, that the *general* sections of the cone were considered: for previously it had been usual to treat only of those, the planes of which were at right angles to one of the sides of the cone: so that an ellipse could only come from an acute-angled cone, and so on. Though Archimedes was aware that all the sections of any cone were of the same nature as those of the limited character above-mentioned (at least it is customary so to state), yet all testimony is against this having been known in the time of Euclid. If, therefore, Apollonius really took the books of Euclid, as according to Pappus he did, he must have so changed the face of them, by generalizing the method of cutting the cone, and introducing the properties of diameters, that they must have differed as much from their original in form and matter as one book can from another. To conclude the subject of the authorship, we remark, in reference to the charge of Heraclius above-mentioned, that the styles of Archimedes and Apollonius are very different: the latter has by no means the power of the former in the management of his demonstrations, and though remarkable for the originality and beauty of the results which he produces, is even tedious in the method of obtaining them. A supposition of Mydorge, which once created considerable discussion, viz., that the fifth, sixth, and seventh books were the work of some Arab under the name of Apollonius, deserves no attention. He must have been but a foolish Arab who would have been willing to relinquish the credit of having written the fifth book.

The most remarkable book in the whole work is the fifth, which treats of maxima and minima. With a little licence it might be called a complete treatise on the curvature of

the three sections, for in considering the number of maxima and minima which can be drawn to the section from any point in its plane, the space inside and outside of the evolute has different properties. There is only wanting the addition of a name for the curve which separates the spaces (which we now call the evolute). This book, and the quadrature of Archimedes, are the highest points of the Grecian geometry.

The work of Apollonius was lightly spoken of by Descartes, who is supposed to have seen the first four books only; but it was held in particular estimation by Newton, and Cardan places its author *seventh* among all the men who have ever lived: in his own age he was called the *great geometer*.

We now briefly mention some of the principal editions of the cones. The celebrated Hypatia, daughter of Theon, wrote a commentary upon them. We have already mentioned Pappus and Eutocius as commentators, Borelli and Halley as editors. Among the Arabs, it was first translated by Thebit-ben-Cora, under the Calif Al Maimun in the ninth century: by Abulfath, in the tenth; and two editions, of little celebrity, appeared in Persian in the thirteenth. In Europe, it was first translated, but badly, by Memnius, a Venetian, in 1537: by Maccolleo about the same time, but we cannot learn that this edition was ever published; also by Commandine in 1566, (misprinted 1666, in Murhard,) and by the Jesuit Claude Richard in 1655. Montucla is incorrect in saying that this edition was announced and never published. See Murhard, *Bibl. Math.* ii., 322; also Bayle, art. *Apollonius*, and Vossius, *de Sci. Math.* (Index, *Claudius Richardus*.) In 1669, Ravius published a translation, of which Halley remarks, that it is more barbarous than can easily be imagined. In 1679, Barrow published the first four books.

Apollonius is supposed by some, among others by Vossius, to be the author of a commentary on Aratus: but Grotius, in his edition of that poet, takes no notice of the report, and as it is believed that Apollonius, the grammarian, also commented on Aratus, the two may have been confounded. Wallis, who held that the ancients possessed a certain algebra which they disguised, seems a little inclined to found this opinion upon a title-page which he discovered in the Savilian library (the rest being cut away). It was *Liber de Arte Notoria, secundum Apollonium*, but he also suspects that the *Art Notoria* may be *magic*, and the *Apollonius* may be Apollonius of Tyana. Algebra was called by many Italians *ars magna*, or *arte maggiore*. That Apollonius did improve the notation of arithmetic appears from the praise given to him by Eutocius, in his commentary upon the quadrature of Archimedes, for a work which he calls *ἡ ἀριθμητική*. The word is probably corrupt; Vossius reads *ἀριθμολογία*, and Halley *ἀριθμολογία*. In the *editio princeps* of Archimedes, Basil. 1533, the Greek is as usual, but the Latin translation gives *Moeytocium*. Pappus more explicitly states that the improvement consisted in a simplification of the method proposed by Archimedes for representing very large numbers, which brought the system nearer to that of the moderns. (See Delambre, *Hist. Ast. Anc.* ii. 9.) Eutocius also says, that Apollonius extended the quadrature of the circle given by Archimedes.

APOLLONIUS RHODIUS, a Greek epic poet, respecting whose personal history only a few facts have come down to us, and even these are by no means well authenticated. Whether he was a native of Alexandria in Egypt, or of Nauratis, a small town on the Canopic branch of the Nile, is a point impossible to determine; but we know that he derived the surname of Rhodius from his long residence in the island of Rhodes. He was the son of Silleus, and spent his early years at Alexandria under the direction of the poet Callimachus. The exact periods of his birth and death are unknown, but we are able to fix some points in his history from other circumstances. Thus we know that Callimachus died about B.C. 230, so that he must have been acquainted with this poet at an early age, and Apollonius succeeded Eratosthenes as keeper of the great library of the Ptolemies at Alexandria, B.C. 194. The cause of his quarrel with Callimachus can only be guessed at: it is said to have been respecting the *Argonautica* of Apollonius, which was not sufficiently admired by Callimachus. In what way the disappointed poet took his revenge we are not told, but it must have been effective, if we may judge from the bitter retort it produced from Callimachus. His poem entitled *Ibis* was directed

against Apollonius, and though no fragments of it remain, we can form some opinion of its character and leading features from the *Ibis* of Ovid, which is said to be an imitation of this poem. Apollonius left Alexandria, probably, in consequence of this quarrel, and took up his residence at Rhodes, where he lived for many years, and was at last recalled to his native country to occupy the place of the learned Eratosthenes. These few facts are gleaned from Suidas, and from a short account of his life prefixed to two of the most antient manuscripts.

Of all his works only one poem remains, entitled *Argonautica*, in four books, containing 5835 verses, and giving a detailed account of the wanderings of the Argonauts. This was a favourite subject with the antient poets; but how much Apollonius borrowed from his predecessors Herodorus and Epimenides, or whether he servilely copied Cleon in the whole design of his work, as an antient scholiast asserts, we have no means of determining. The opinion of Quintilian (x. 1. 54) seems to be just and impartial. He considers the poem as possessed of considerable merit, but greatly deficient in true poetic spirit. (See also Longinus on *the Sublime*, xxxii.) It is easy to perceive that Apollonius does not possess the qualities which constitute a great poet: he impedes the narrative with a minute and superfluous detail of circumstances till the reader's patience is fairly worn out. There is an affectation too of learning which often degenerates into pedantry. He has been most successful in his treatment of the tender passions: nothing can be more beautiful than the manner in which he paints the gradual progress of Medea's love for Jason till it became one absorbing passion. In this he is not surpassed by Virgil, who is said by Macrobius (*Saturn.* v. 17, ed. Bipont.) to have borrowed his idea of Dido's love for Æneas from this part of the poem of Apollonius.

Many learned Greeks wrote commentaries on Apollonius: and the Latin poet Valerius Flaccus closely imitated him in his work, also entitled *Argonautica*. Terentius Varro translated it into Latin: in still later times it was turned into Iambic verse by Marianus. The first edition of this work was published at Florence, 1496, and is of great value to book collectors. That of Beck, Lips. 1797, containing the text of Brunek with some corrections, a good Latin version, and an excellent table of contents, is one of the best editions. A. Wellauer published a new edition at Leipzig, 1828, 2 vols. 8vo. It has been translated into English by Green, Fawkes (1797), and Preston (1803); into Italian by Flangini (Roma, 1791); into German by Bodmer (Zürich, 1779); and into French by Caussin (1797). For explanatory works, the reader may consult Schoenemann, *Comment. de Geograph. Argon.* Götting. 1788; Gerhard, *Lectiões Apolloniæ*, Lips. 1816; Weichert, *Ueber das Leben und das Gedicht des Apollonius von Rhodus*, Meissen, 8vo. 1821.

APOLLO'NIUS, a celebrated statuary of the island of Rhodes, who, along with Tauriscus, executed a group in marble which represented Zethus and Amphion binding Dirce to the horns of a furious bull, to avenge their mother, Antiope, whom she had cruelly persecuted. This group, described by Pliny (xxxvi. 4), is supposed, with much probability, to be what is known to us under the name of the Toro Farnese, found during the reign of Paul III. in the ruins of the Baths of Caracalla. It must not, however, be supposed that we see it exactly in the state in which it was found. The lower half of the figure of Dirce, the two trunks and a leg of Zethus and Amphion, were the only remnants of the antient sculptors, but it is sufficient to prove that the art was then in its highest degree of perfection. The group has been restored in the very worst taste by a Milanese artist, Batista Bianchi. We have no means of discovering, with any degree of certainty, at what time Apollonius lived, but some have imagined that it was a few years after Alexander the Great. (See Piranesi, *Statue*: Maffei; Winkelmann, vi. i. p. 128; Müller, *Handbuch der Archæologie*, &c. p. 137.)

APOLLO'NIUS, a celebrated statuary, the son of Nestor of Athens, only known to us from his name being inscribed on the fragments of a statue which was discovered in the fifteenth century, and is now called the Torso Belvedere. It has neither head, arms, nor legs, and yet it is considered one of the master-pieces of antiquity. Michael Angelo made it his grand object of study; and so enthusiastic was he in his admiration of it, that even after his sight failed him, he used to be led to it that he might enjoy the pleasure of feeling it with his hands. All agree as to its being one of the

finest specimens of antient sculpture, but there is some doubt as to the period when Apollonius lived. Meyer, in his *History of Greek Sculpture*, p. 296, imagines that he discovers a great resemblance between the Torso Belvedere and the Ilissus of the Parthenon, while Thorwaldsen, acknowledging fully the merits of the statue, considers it the production of a much later age. Others think that this opinion is confirmed by the particular form of the letters in the inscription, but no dependence can be placed on this circumstance, as the name may have been inscribed centuries after the statue was executed. Visconti, Pio Clementino, t. i. plate x; Winkelmann, x. iii. s. 15; Thiersch, *Kunst-Epoche*, p. 333.

APOLLO'NIUS, the Sophist, supposed to have lived at Alexandria in the time of Augustus, is the author of a Lexicon of Homeric words, entitled *Ἀἰεὶς Ὀμηρικά*. It was first published by Villoison at Paris, in 1773, in two vols. 4to., accompanied by a commentary and prolegomena. The work was reprinted at Leyden in 1788, 8vo., with notes by Tollius, but with the omission of Villoison's Latin translation and prolegomena.

APOLLO'NIUS of Tyana was born, at the commencement of the Christian æra, in Tyana, a town of Cappadocia. At the age of fourteen, his father, Apollonius, sent him to Tarsus, to study grammar and rhetoric under Euthydemus, a Phœnician. Dissatisfied with the luxury and indolence of the citizens, Apollonius obtained his father's permission to retire with his master to Ægæ (Ayas), a town near Tarsus, where he became acquainted with the doctrines of various philosophers. His master, Euxenus of Hieraclea in Pontus, was little disposed to practise the austerities of the Pythagorean and neo-Platonic sects, the doctrines of which he professed. Apollonius observed the Pythagorean rules more strictly, took up his abode in the temple of Æsculapius at Ægæ, famous for miraculous cures, abstained from animal food and wine, lived upon fruits and herbs, avoided in his dress every article made of animal substance, walked barefoot, and let his hair and beard grow. The priests initiated him in their mysteries, and said that Æsculapius himself rejoiced at having Apollonius a witness of his cures. Apollonius recommended his moral and ascetic doctrines by example, and by an appeal to the heathen gods. He healed a young Assyrian afflicted by a disease which was a consequence of intemperance, by teaching him that the gods were willing to give health to all who were willing to receive this gift. Having finished his studies at Ægæ and other cities of Cilicia and Pamphylia, Apollonius travelled by land to India. At Niniveh he met with Damis, who became his interpreter and travelling companion. On a rock of Mount Caucasus he saw the chains of Prometheus. King Bardanes, his priests, and magi, honoured him at Babylon. In Taxila, a town of India, he met with the king, Phraortes, a descendant of Porus. In India he also saw a woman consecrated to Venus, who was black from the head to the chest, and white from the chest to the feet. He joined a party who hunted dragons by magic. The eyes and scales of these dragons shone like fire, and were talismans. He saw the animal *martichoras*, (mentioned four centuries before by Ctesias,) with the head of a man and the body of a lion, fountains of golden water, men who dwelt below the ground, griffins, the phoenix, the precious stone pantarbas casting rays of fire, and attracting all other gems, which adhered to it like swarms of bees. Phraortes recommended him to the president of the gymnosophists, who revealed to him all their secrets, convinced him that Pythagoras had borrowed his wisdom from them, and compelled him to recognise their superiority in the performance of miracles. Apollonius returned from India by sea, was much admired in the towns of Asia Minor, conversed at the grave of Achilles with the ghost of this hero, enchanted the demons, and uttered prophecies. He threatened the Ephesians with pestilence unless they would mend their immoral lives. They were converted, but nevertheless the plague broke out among them: The Ephesians sent messengers to Apollonius, then at Smyrna, requesting him to drive away the plague. Apollonius was in a moment at Ephesus, conversed with the people in a theatre, commanded them to stone a beggar, and ordered them to remove the stones on the following day, when, instead of the beggar, a large dog was found into which the demon of the plague had entered, the ravages of which had now ceased. The Greek priests at Athens, in the Peloponnesus, the oracles at Paphos, Pergamus, and Colophon, heaped their marks of honour upon Apollonius.

He afterwards went to Crete, and finally arrived in the reign of Nero at Rome, where he and his followers being questioned by the magistrates concerning the object of their journey, overcame their mistrust by restoring to life the dead body of a noble lady, predicting an eclipse of the sun, and that there should happen and not happen a great event, which prediction was considered to be fulfilled when, three days after, the cup which Nero held in his hand was struck by lightning. When Nero left Rome for Greece, he ordered all foreign philosophers to quit the city. Apollonius went to Spain, and stirred up a rebellion against Nero and the Romans. He then visited Africa, the south of Italy, and Sicily, where he heard of the death of Nero. Apollonius again visited Athens, and was initiated by the hierophant of Eleusis into the mysteries of that place. He next visited Egypt and Ethiopia, and sought for the sources of the Nile. In Egypt he joined Vespasian, who probably found it politic to gain a man whose sanctity and miracles had raised him to the rank of a deity; for during his lifetime, and still more after his death, Apollonius enjoyed this distinction, and was sometimes ranked with Jesus Christ. (See *Life of Alexander Severus*, by Lampridius, cap. 29.) Afterwards he revisited Asia Minor and Rome, where he was accused by Euphrates of high treason against Domitian, and cast into prison. Having blamed the emperor for suffering such informers, he removed to Puteoli, where he met his followers, Damis and Demetrius. He again visited Sicily, Greece, and Asia Minor, performed miracles, and had many adventures, until he died, eighty, or ninety, or one hundred, or one hundred and seventeen years old, either at Ephesus, or at Lindus in the temple of Pallas. Others say that he was chained, and shut up in the temple of Dictynna in Crete to be eaten by dogs. But when the temple was reopened, the voices of invisible virgins proclaimed his elevation to the skies, and his chains were found burst asunder. These statements are chiefly found in *The Life of Apollonius* by Philostratus. The two first books exist in an English translation by Charles Blount, Lond. 1680, fol. In 1693, this translation was suppressed on account of the annotations being hostile to Christianity, and Blount committed suicide. Philostratus wrote the Greek original by order, and from the information of Julia, the wife of Septimius Severus, who died 217. The empress had obtained possession of the account which Damis had formerly given to a relative.

It is almost needless to remark that the life of Apollonius is a heap of absurdities and impossibilities. Apollonius was probably a cunning impostor, and one of the pretenders to miracles, not uncommon in that age: his biographer, Philostratus, must have been rather credulous if he believed one half of what he wrote about his hero. The fact of Apollonius being mentioned by no writer earlier than Apuleius and Lucian (see his *Alexander*), tends to show that his celebrity during his lifetime was not so great as his biographer would have us believe. Philostratus himself wrote his account of Apollonius about a century after the wise man's death. Some extant letters, attributed to Apollonius, are printed in the collection of Aldus and Cujacius; and a few appear in his life by Philostratus. For further remarks on the character of the *Life of Apollonius*, see PHILOSTRATUS, FLAVIUS. A remarkable passage in the *Life of Aurelian* (chap. 24) by Vopiscus, shows that the fame of Apollonius was even then firmly established, and that temples and statues still existed in honour of this 'true friend of the gods,' as the credulous historian calls him.

It appears from Suidas and Eudocia, that a person called Soterichus Oasites also wrote a life of Apollonius.

APOLOGE'TICS (*theologia apologetica*, apologetik) is the designation given in Germany to that branch of divinity which is most intimately connected with logic, metaphysics, and general history, and has for its object a systematic arrangement of those internal and external evidences by which Christians are enabled scientifically to justify the peculiarities of their faith. The name is derived from a Greek adjective *apologētikos* (ἀπολογητικός).

Since Christianity was opposed from the beginning by men who denied its high origin and its intellectual superiority, circumstances demanded on the part of Christians a compliance with the express injunction of the apostle Peter, 'Be ready always to give an answer (πρὸς ἀπολογίαν, for an *apology*) to every man that asketh you a reason of that hope which is in you.' (1 Pet. iii. 15.) Separate *apologies* have the same relation to apologetics that sepa-

rate mathematical treatises have to the science of mathematics.

The science of apologetics was not the offspring of literary vanity; it was unknown till the attacks of the adversaries of Christianity assumed a learned and scientific character. In the first centuries of our æra, whilst most opposers asserted that the Christian religion was the cause of famine, and earthquakes; and that Christian worship consisted in eating children, drinking human blood, committing incest, and adoring the head of an ass, or some such abominations, separate apologies were sufficient for the refutation of these absurd charges. The name is of still later origin than the science of apologetics. The word *apologetik* was universally adopted after Gottlieb J. Planck had used it. (See his *Einleitung in die Theologischen Wissenschaften*, 1794-8, vol. i., p. 231-362.) As the fundamental idea of mathematics is that of quantity; of jurisprudence, that of right; of æsthetics, that of the beautiful; so the fundamental idea of apologetics is that of supernatural *revelation*. The apologetics contain a further development of one part of dogmatics or doctrine, which is called bibliology. Apologetics teach how to *defend* the fundamental ideas of Christianity against unbelievers; polemics teach how to *attack* those who, admitting the Christian revelation to be true, err in particulars.

The science of apologetics treats of the

I. Possibility of revelation.

1. Logical possibility. Logical refutation of those who, like John Toland, Edelmann, and Rousseau, considered the idea of revelation to be self-contradictory.

2. Theological possibility. Metaphysical refutation of those who considered the idea of supernatural revelation to be repugnant to the attributes of God, impartial justice, general love, and immutability.

3. Anthropological possibility. Refutation of those who, like Immanuel Kant, deny the ability of man to perceive the supernatural.

II. Necessity of revelation, to be demonstrated by historical and ethnographical induction, especially by the history of philosophy.

III. Reality of revelation, demonstrated by a development of the internal evidence of the peculiar Christian doctrines, and confirmed by the historical credibility of the Gospel history.

Apologetics, though based upon the Gospel, constantly require a new adaptation to the times for which they are written. There are many good apologies, but apologetics are yet in their infancy. Although they are lectured upon in the universities of Germany, they are yet a desideratum in England.

Among the societies, foundations, donations, &c., which have an apologetic character, may be mentioned the Bampton Lectures at Oxford, Hulse's foundation of the Christian Advocate at Cambridge, the London Society for promoting Christian Knowledge, with all similar societies, the Society for the Defence of Christianity at the Hague, &c.

APOLOGIES OF THE FATHERS are writings in defence of Christianity, composed from the beginning of the second to the sixth century. The opposers of Christianity generally attacked the moral character of the Christians rather than their doctrines. The fathers of the church, with the view of refuting the doctrines of heathenism and the false accusations against the followers of Jesus, composed *Apologies*, which were partly addressed to all well-informed heathens, partly written on particular occasions, and addressed to emperors in order to convince them of the injustice and folly of persecutions.

The *apologies* of Quadratus and Aristide are lost. Justinus Martyr describes, in two apologies, how he sought for truth in various systems of philosophy until he found it in the Gospel. In his Dialogue with the Jew Tryphon, Justinus Martyr appeals to the prophecies of the Old Testament. The apologies of Justinus contain many materials for the history of philosophy. Athenagoras defended the Christians against the charge of atheism, incest, infanticide, and other abominations with which they were charged. Tatianus, Theophilus of Antioch, and Hermas, proved the absurdity of paganism and the contradictions of philosophers in order to show the necessity of revelation.

After these Greek apologists of the second century followed, among the Latins, Tertullian, who, in his *Apologeticus*, eloquently shows how the faith and holiness of Christians were especially manifested under persecutions; and Minucius Felix, who, in his eloquent dialogue, *Octavius*,

introduces the representatives of various parties, whose arguments are overcome by the truth of the Gospel. Cyprian wrote *De Idolorum Vanitate*, or, *On the Absurdity of Idolatry*. These apologists of the second century did not defend the systems of certain schools, but only the truth of Christianity.

In the fifth century the doctrines of the Gospel were systematized by Origen among the Greeks and Arnobius among the Latins, in order to defend them successfully against the attacks of Celsus, Porphyrius, Hierocles, and Julian, which were directed not only against the morals of the Christians, but also against their history and their doctrines. These writers compared the miracles of Jesus with those of Pythagoras and Apollonius of Tyana, and questioned the credibility of the Evangelists. They recognised the leading facts of the Gospels, but endeavoured to prove contradictions in minor points. The objections are answered in the eight books of Origen against Celsus, who wrote his attack on Christianity about one hundred years before it was replied to by Origen. But the greatest apologist among the fathers is Eusebius, whose historical and chronological works have an apologetical tendency, and whose evangelical preparation (*προπαρασκευὴ εὐαγγελική*, or *εὐαγγελικὴ ἀποκρίσις προπαρασκευή*) contains, in fifteen books, the introduction to his Evangelical Demonstration (*εὐαγγελικὴ ἀπόκρισις*), in twenty books. The first ten books of this work are still extant, in which he demonstrates the harmony of the Old with the New Testament, the moral dignity of Jesus, the sublimity of his plan, the rectitude of his disciples, and the absurdity of those who ascribed another plan to the disciples than that which they professedly followed. Eusebius examines, in a little publication against Hierocles, the life of Apollonius of Tyana by Philostratus, and shows the contradictions of the biographer, the knavery of this notorious individual, and how his performances differed from the miracles of Christ. The works of Athanasius and Chrysostomus contain apologetical materials. Cyrillus of Alexandria wrote ten books in reply to the emperor Julian. Theodoret wrote twelve sermons under the title 'ΕΛΛΗΝΙΚΩΝ ΣΥΝΑΓΕΥΤΙΚῆ ΠΑΤΗΜΑΤΩΝ ἢ Εὐαγγελικῆς ἀληθείας ἐξ Ἑλληνικῆς φιλοσοφίας ἐκτίρωσις, in which he gathers the arguments for Christian truth from the writings of the heathens, and compares the Greek philosophers with Moses, the prophets, and the apostles. The most important apologetical works among the Latins are the seven books of Arnobius (*Adversus Gentes*) against the heathen; the seven books of Lactantius, *Institutionum Divinarum*; the twenty two books of St. Augustin, *De Civitate Dei*; the catalogue of St. Jerome, by which he refutes the objection that no distinguished individuals embraced the Gospel (*Catalogus Virorum Illustrium*); and, finally, *Orationes libri septem Historiarum adversus Paganos*, in which he refutes the assertion that plague, famine, earthquakes, and other horrible events were consequences of the Gospel. The science of apologetics has made progress in the same ratio in which the attacks upon Christianity became more systematic.

The following translations and editions will be interesting to English readers. Justin the philosopher, commonly called Justin Martyr, died about A.D. 165. His *Apologia prima pro Christianis*, published by Dr. Grabe, Oxon., 1700; *Apologia secunda*, by Hutchinson, Oxon., 1703; *Justin Martyr's Full Account of the Christian Worship, Baptism, and the Lord's Supper, with Notes of Dr. Grabe and Mr. Whiston: Dialogus cum Tryphone Judeo*, London, 1722, 8vo.; *The Apologies of Justin M., Tertullian and M. Felix, with the Commentary of Vincentius Lirinensis*, by Reeves, 1709 and 1716—an unfaithful translation; *The Dialogue with the Jew*, by Brown, London, 1755, is an excellent translation, and very scarce in the book-market. Minutius Felix, of the third century, author of *A Dialogue between Cæcilius a Heathen, and Octavius a Christian*, is well translated by Sir David Dalrymple.

APOLOGUE, synonymous with fable (*ἀπόλογος*, *fabula*, fable), a novel story contrived to teach some moral truth. It is a species of fiction, and is well told, and with such humour, as to need no sentiment. It is a story, or a tale, or a fable, or a parable, or a moral at the end to make the application. (Shakespeare's *Apologue* that the circumstances told in it is essential to an *apologue*. Some have gone so far as to say that it should be fictitious, an impossibility, as in Aesop's fables, they must involve an impossibility, as in Aesop's fables, where we find beasts and inanimate things made to speak.

APOLOGY (*ἀπολογία*), a Greek word, originally signifying a defence made in a court of justice by or for a person accused. (See the titles of several of the extant Greek orations.) The word *ἀπολογεῖσθαι*, to 'apologize,' to 'make a defence,' was the corresponding verb. There is extant a small piece attributed to Xenophon, entitled the *Apology of Socrates*; and another, with the same title, by Plato. The word apology was adopted by the Christian fathers [see *APOLOGUES*]. At the present day it is only used in ordinary language in one sense, that of asking pardon or excuse for some offence. But even in modern times the word has occasionally been used in the early Christian sense, as by Bishop Watson in his treatise entitled an *Apology for the Bible*, and by Barclay in his *Apology for the Quakers*.

APOPHTHEGM (*ἀπόφθεγμα*), a Greek word signifying 'a thing spoken out,' and, in its more technical sense, a pithy saying calculated to arrest the attention. 'Certainly *apophthegms* are of excellent use. Cicero prettily called them *salinas*, salt-pits, that you may extract salt out of, and sprinkle it where you will. They serve to be interlaced in continued speech. They serve if you take out the kernel of them and make them your own.' (Bacon.)

We may take the following as examples of apophthegms:—'Bigotry murders religion, to frighten fools with her ghost.'—*Ibid.* Plutarch made a collection entitled *The Apophthegms of Kings and Generals*, and dedicated it to the Emperor Trajan. Many of these apophthegms would be classed in modern times among anecdotes. The following is an example; it is one of the apophthegmata placed under the head of Alexander: 'An Indian was taken prisoner who had a very high reputation for archery, and was said to be able to shoot an arrow through a ring. Alexander bade him exhibit a specimen of his skill, and on his refusal, the king in a passion ordered him to be executed. On his way to his death the man remarked to those who were taking him, that he had not practised for several days and was afraid of missing his mark. Alexander hearing of this, admired the man, and setting him loose, made him great presents, because he preferred death to the loss of his reputation.' (Wytenbach's edit., vol. i., p. 718.)

The Iacædæmonians were noted for affecting the apophthegmatic mode of speech; and Plutarch has collected their sentences also under the title of *Iacædæmonica*.

APOPHYLLITE, a crystallized mineral, whose fundamental form is the square prism, fig. 1. Its most general modification is obtained by supposing the angles of fig. 1 cut off, so as to give rise to a plane triangular surface, as is seen at *a* in fig. 2; these faces *a*, from the plane cutting deeper into the original crystal till they intersect each other, frequently lose their triangular form, and of course, at the same time, the face *P* again becomes a square, and the prism will be terminated by the form seen in fig. 3. On account of these modifications, apophyllite sometimes assumes the form in fig. 4.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

The inclination of *P* on *a* is $120^{\circ} 5'$
 " *L* on *a* is $128^{\circ} 20'$
 " *a* on *a* is $104^{\circ} 18'$

The structure of this mineral is lamellar, and admits of cleavage in directions parallel to the sides of the regular prism, but most readily in the perpendicular to its axis. Its colour is white or grey, sometimes tinged green or red; it possesses various degrees of transparency, and occurs even opaque. In hardness it approaches nearly to apatite; and

its density varies from 2.3 to 2.5. Before the blow-pipe it forms a white glass. Its chemical constitution is stated as follows:—

and the mineral is therefore an hydrated silicate of potash and lime.

Apophyllite has been found in the mines of magnetic iron-ore of Sweden and Norway; in the lead-mines of the Harz mountains; also in the cavities of several basaltic rocks, at Marienberg in Bohemia; at Fossa in the Tyrol; in the isle of Skye, &c. In the basalts it is usually accompanied by analcime and stilbite.

APOPLEXY, from ἀποπληξία, a sudden blow, a deprivation of power and motion, &c. *Morbus attonitus, sideratio, percussio*, &c., are synonymous terms. In the animal body two sets of functions perfectly distinct from each other are combined, the **ORGANIC** and the **ANIMAL**; the organic include the various functions by which the structure of the body is built up and its integrity maintained, and the animal include the functions of sensation and voluntary motion. [See LIFE.] The disease termed apoplexy is an affection of the animal functions, the organic remaining comparatively unimpaired. It is the loss of sensation and voluntary motion, while respiration, circulation, secretion, and the other functions of the organic life continue to be performed, though not indeed without more or less disorder.

Of all the diseases to which the human body is subject, there is none which is commonly conceived to attack so suddenly, and to kill so rapidly. What is usually called the attack is indeed sudden; but the disease itself, so far from being sudden, is generally even slow in its progress, giving distinct and repeated indications of its presence and of its course. The signs by which the apoplectic constitution is denoted, the **PREMONITORY SIGNS** of the disease as they are termed, it is of the utmost importance to observe, because judicious measures adopted at this stage will almost always avert an attack, or render an attack mild which would otherwise have been mortal. There are few other diseases over which both the physician and the patient have so much control: the patient by the general management of himself, in removing the constitutional predisposition to it; and the physician by active remedies when the attack is instant, in effecting what the general management may have proved inadequate to accomplish. Prevention is often practicable; but when the attack has once come on, life is in imminent peril: the most judicious and powerful remedies, though resorted to instantly, and employed with the greatest skill, are commonly unable to avert death; and even when they do succeed, the functions of the brain and the general health have usually sustained so severe a shock that life is no longer worth possessing.

In general, the **PREMONITORY** symptoms are steady in their nature, uniform in their course, and so obvious that all may perceive and understand them. Considered individually, they may appear numerous and diversified: but they are really so much alike, that they all obviously belong to one class.

Among the premonitory symptoms the most remarkable are the following, which are here enumerated in the order of their importance and frequency.

1. **Drowsiness.** This feeling may exist in every degree from unusual dulness of mind to an uncontrollable propensity to sleep. There may be merely inability to fix the attention, or to carry on the intellectual operations with the usual vigour, or the individual may absolutely fall asleep in the midst of his ordinary occupations. The last is the more alarming event, and for that very reason the less dangerous, because it is a circumstance with which few can fail to be struck; but an unusual heaviness or torpor of mind may be overlooked or neglected: and thus, when at last the apoplectic attack comes, though warning of its approach were really given, it may be truly a surprise. Connected with drowsiness, and occasionally in the room of it, there is a sensation of weight in the head, or a feeling of fullness.

2. The next premonitory symptom is giddiness. Giddiness is more alarming than drowsiness, and would never fail to produce a conviction of danger, but that giddiness often arises from other causes; for example, from a disordered state of the stomach. Whenever giddiness is present, while the functions of the stomach are sound, its source should be carefully investigated; and even when the digestive functions are manifestly disordered, it should still be minutely

investigated and vigilantly watched, because tendency to apoplexy and disordered stomach may co-exist, and the symptoms of the latter may mask those of the former. If the giddiness be combined, as it often is, with a feeling like that of approaching fainting, it may be considered that there is but a single step from the actual supervision of the paroxysm.

3. Connected with these two important symptoms are a number of subordinate sensations, which are of consequence chiefly as marking the presence of the more serious indications. The sensations in question are the ordinary companions of the first two, and are often the most prominent and obtrusive, and therefore serve to direct attention to the more important symptoms. Such concomitant and subordinate symptoms are, frequent yawning, dulness of hearing, imperfect or disordered vision, noise in the ears, motes or sparks before the eyes, repeated sneezing, occasional hiccup, and the like.

4. All this time there is generally some degree of pain in the head. The intensity of the pain may vary from the slightest uneasiness to the most intolerable headache. The slightest degrees of pain are more common than the severer, the patient usually stating that his pain is trifling. The seat of the pain is often in the forehead, and deep in the socket of the eyes, rendering them intolerant of light; but it may also be at the back part of the head, extending down the neck, between the shoulders. In the severer states of pain it is often attended with dulness and redness of the eyes, flushing of the face, and throbbing of the arteries of the neck and head. Frequently, however, there is no degree of pain whatever, and this is the occasion of a false security, alarm not being taken at the presence of the other symptoms because of the absence of pain. In general, when serious disease attacks vital organs, pain is excited, and we are thus warned of our danger; but sometimes a mortal disease invades an organ without inducing the slightest pain, and there is no disease more apt to do this than apoplexy. If, combined with the other premonitory symptoms, there be pain in the head, the inference is obvious; if there be none, the danger is the greater; for the enemy is as certainly at hand, but his approach is insidious.

5. Last in the train comes a symptom which is more important than any of the preceding, because it demonstrates their true nature, and shows that the actual attack is instant; namely, paralysis, whatever its form or degree, whether it assume the shape of inability to articulate distinctly, or to write steadily, or to walk firmly, or in reading to fix the eye on the right line, or in talking or laughing to keep the mouth in the natural position, or in deglutition to swallow without unusual difficulty, or without exciting cough. If with this loss of muscular power there be at the same time a sense of pricking over the skin, or a numbness in the limbs or fingers, or difficulty in voiding the urine, or distortion of the face or mouth, dropping of the eyelid, stammering, unsteadiness in the gait, and so on, the attack may be considered as having actually commenced.

Of these premonitory symptoms one alone may be present, or two may be combined, or several may co-exist or may follow each other in rapid succession. The period of their duration, before the attack supervenes, is different in every individual case. Sometimes there elapse only a few hours; more frequently several days; occasionally many weeks. When they are present, no man is safe from a fatal attack for a single instant.

With regard to the attack itself, the phenomena are different according to its intensity. There are, indeed, various modes or forms of the disease which are mainly matters of degree; nevertheless, these diversities are not only very striking in their own nature, but in a practical point of view are highly important, because the remedies appropriate to the one are not suited to the other, at least without such modifications as, in point of fact, to render them different remedies.

For all practical purposes it will be sufficient to comprehend the various forms of the disease under four heads, namely, first, that in which the attack is sudden and violent; secondly, that in which the attack is comparatively slight at the commencement, but progressively increases in severity; thirdly, that in which the attack commences with apoplexy and terminates in paralysis; and, fourthly, that in which the attack commences with paralysis and terminates in apoplexy.

1. The sudden and violent form constitutes the *apoplexia*

fulminant of the older authors; the *apoplexia fortissima* of more modern writers; and the *apoplexie foudroyante* of the French. In this form of the disease the patient is struck senseless and motionless instantaneously: he falls down and lies utterly deprived of all the functions of the animal life. The organic functions in the mean time go on, but in an unnatural and disordered manner. The respiration is slow, deep, and accompanied with that peculiar noise which is called stertor: the pulse is fuller, stronger, and slower than natural: the urine and feces are passed without consciousness: the skin is covered with a cold and clammy perspiration; foam flows from the mouth; the face is flushed, tumid, and sometimes even livid. Death may take place in a few minutes, or a few seconds, or not until the end of the first, or even the second, day; but life is seldom protracted beyond the second day. Now and then the prompt and vigorous employment of the appropriate remedies saves life even in this form of the disease; but if they fail to restore consciousness in a few hours, they commonly fail altogether, and death almost always happens when the paroxysm continues undiminished during twenty-four hours.

On examining the state of the brain after death from this variety of the disease, the blood-vessels of every part of the cerebral substance and of the delicate membranes that invest it are found gorged with blood; there is also sometimes an effusion upon its surface, beneath its membranes, and within its cavities, of the thinner portion of the blood called serum, while, in many cases, pure blood itself is poured out on various parts of the brain from some ruptured vessel. Occasionally no morbid appearance can be detected sufficient to account for the attack, or for death, the consequence of it.

2. In the second form of the disease, in which the attack is less violent in the commencement, but progressively increases in severity, the loss of sensation and voluntary motion is neither sudden nor complete, or, if it be so, the abolition of these functions is only of momentary duration. Instead of stupor and coma, the patient is seized with a sudden and violent attack of headache, attended often with sickness and vomiting. The pain of the head is sometimes so severe that the patient sinks down under it, pale, faint, and exhausted, occasionally with a slight convulsion; but from this state of depression he recovers rapidly, still however remaining weak, faint, and chilly, with a quick and feeble pulse, a sunk countenance, and occasional vomiting. This state having continued from one hour to three, or more, the heat increases, the pulse acquires strength, the face becomes flushed, the sunk expression of the countenance disappears, and torpor or stupor rapidly supervenes, the patient appearing dull and heavy, answering questions slowly and with difficulty, and sinking at last into a state of profound coma. From the first invasion of the attack to the coming on of perfect coma, the period may vary from one hour to three days and more. This form of the disease is at least equally dangerous with the preceding, and, in fact, generally proves fatal.

On examining the state of the brain after death from this variety, there are found extensive effusions of blood; softening of the substance of the brain; sometimes ossification (conversion into bone) of portions of its membranes; but far more constantly ossification of the coats of its blood-vessels, which organic change in the structure of the blood-vessels diminishes their strength, renders them incapable of resisting the current of the blood and of carrying on the circulation, and thus predisposes them to rupture.

3. The third form of the disease commences with a distinct apoplectic paroxysm, which terminates in paralysis. When the apoplectic symptoms disappear, some part of the body is found to be paralyzed; it may be the muscles of the face, giving rise to various kinds of distortion; or the muscles of the limbs, occasioning inability to move the affected member; or the muscles of one side of the body, producing what is called *hemiplegia*; or the muscles of one half of the body, *paraplegia*. In the great majority of cases the speech is more or less affected, the power of articulation being either wholly lost or greatly impaired. Often the sensibility seems unimpaired, the patient endeavouring to express himself by words or signs; but, at other times, the mind itself is indistinct, confused, rambling, and incoherent. Occasionally in this form of the disease the apoplectic state disappears rapidly, while the paralysis remains for years. Sometimes the paralysis slowly diminishes until suddenly another apoplectic attack supervenes, leaving the paralysis

greater than before; at other times the paralysis continues undiminished for days, months, and years, until a second, or a third, or a fourth apoplectic paroxysm at length destroys the patient. In the few cases in which there is a perfect recovery from the paralysis, the mind is always slow in recovering its energy, and often never regains it.

On examining the state of the brain after death from this variety, there is commonly found an extravasation of blood into a defined cavity formed in the substance of the brain, constituting what is termed an apoplectic cell; but although this be the most ordinary form in which the blood is effused in this variety of the disease, yet there may also be a general extravasation of it, as in the other varieties, or mere effusion of serum; or softening of the cerebral substance, or ossification of the membranes, or of the blood-vessels, or several of these morbid conditions may be combined.

4. In the fourth and last form of the disease, in which the attack commences with paralysis and terminates in a complete apoplectic paroxysm, the premonitory symptoms are, in general, very distinctly marked. Drowsiness, giddiness, disordered vision, impaired memory, and pain of the head especially, commonly precede the attack. While the brain is thus affected, the limbs about to become paralytic are troubled with pricking, tingling, numbness, weakness, and cramp. These local ailments progressively increasing, the limbs at length become decidedly paralytic, and the paralytic state having continued for an indefinite period, an apoplectic paroxysm supervenes, often preceded and denoted by spasms or convulsions in the unparalyzed limbs. The coma which forms a part of the apoplectic paroxysm, sometimes comes on gradually, and is manifestly progressive in intensity, the patient at first being capable of giving a coherent answer when strongly roused, but by degrees the loss of sensation becomes more and more complete, until at last the stupor passes into a state of total insensibility, from which there is no recovery. Now and then the patient recovers from the apoplectic state, and slowly regains the condition he was in previously to the apoplectic attack; more frequently, on the contrary, the paralytic affection increases, and another apoplectic seizure quickly supervenes, which proves mortal.

In some cases the morbid appearances that present themselves on inspection of the brain after death from this variety, differ in no respect from those which have been described as belonging to the preceding form; but the most frequent and characteristic morbid change is the softening of some portion of the substance of the brain. This softening of the cerebral substance is the result of inflammation, which is generally not acute in its nature, and is slow in its progress. The vessels belonging to this softened portion lose their vitality, and allow the red particles of the blood to pass through them, so that the part morbidly changed is not only soft but red, from the infiltration of blood through the diseased blood-vessels.

From this account of the phenomena of the disease, and of the morbid changes apparent in the brain in fatal cases, we are enabled to form an accurate conception of the pathological condition of the brain in apoplexy. Two of the conditions essential to the performance of the functions of the brain, are a supply of a certain quantity of blood, flowing with a certain impetus and freedom from pressure. Without a certain portion of blood flowing with due impetus, the functions of the brain fail; with more than a certain portion, or with the velocity of the current quickened or retarded beyond a certain point, they equally fail: and when the pressure induced by either of these states exceeds a certain degree, they also immediately cease. The substance of the brain is tender and delicate, and abounds beyond all other organs with blood-vessels. It is of a soft and yielding nature, but it is enclosed in a firm, unyielding case. Coupling this fact with the phenomena of the circulation, it is easy to conceive how almost its entire mass, and still more readily how particular portions of it, may become subject to undue pressure, and how, as an inevitable consequence, the functions of the brain may become deranged. Any cause which quickens or which retards the circulation through it may produce this effect: for example, a preternatural distension of the arteries with blood, or a preternatural intensity in their action, and a consequent increased impetus of the circulation; or, on the contrary, a relaxation of the veins, a preternatural turgescence of them from a too great quantity of blood poured into them, and a consequent retardation of the circulation through

them. Either from a too great velocity or intensity of the circulation in the arterial vessels, or from too great distension of the veins in consequence of an impeded flow of the blood through them, the thinner portion of the blood or serum may be poured out upon the brain, which in this manner may become subject to undue pressure. In consequence of either of these diseased states, the coats, whether of the arteries or veins, may suddenly give way and break, and the blood poured out upon the brain from the ruptured vessels may exert such a pressure upon it as instantly to destroy its functions. Again, tumors occasionally form in the brain, which progressively increase in magnitude, and at length exert such a degree of pressure upon the cerebral substance, as is no longer compatible with the performance of its functions.

The brain, like all other organs, is nourished by organic processes, over which the organic nerves exert a most important influence. The blood-vessels of the brain, like those of all other organs, depend for their vital energy on organic or ganglial nerves [see NERVE], which are distributed to them in great abundance. We may conceive that the organic nerves which preside over the nutriment of the brain may fail in their functions to such a degree, that the brain may be deprived of its vital power, and hence its functions necessarily cease. And this without doubt is the case in those fatal attacks of apoplexy in which no morbid appearance can be detected in the brain sufficient to account for death. We may conceive that the organic nerves which impart vital energy to the blood-vessels of the brain may fail in their functions to such a degree, that the blood-vessels may not only be incapable of performing their natural actions, but may become diseased in structure, their membranous, firm, and elastic coats becoming indurated, brittle, and bony. On the other hand, these organic nerves may become preternaturally irritable, and consequently produce an inordinate action in the blood-vessels. And those are the ordinary changes which precede and which predispose to apoplexy; and, in a practical point of view, these facts are of paramount importance, for they show that apoplexy is not a sudden disease, that it is even slow in its progress, and that it is as much in our power to retard or stop that progress, by the judicious employment of remedies tending to restore the brain to a sound condition, as it is by the use of such remedies to check morbid changes of structure in any other organ of the body.

Prognosis.—When once an attack has come on, even though it be slight, it places the individual in imminent danger, both because it greatly increases the predisposition to a recurrence of the paroxysm, and because, when it does not destroy life, it gives a shock to the constitution which is seldom entirely repaired, and never without much time and most judicious management. In the paroxysm the immediate danger is proportioned to the profoundness of the coma, the degree of stertor, the slowness and laboriousness of the respiration, and the frequency and intermission of the pulse. Other unfavourable signs are, delirium, convulsions, paralysis, involuntary and unconscious discharge of the urine and feces, and above all, the continuance of the paroxysm without material diminution of its severity after the judicious employment of powerful remedies. When the respiration is exceedingly slow and laborious—when the pulse sinks to such a degree that it can be scarcely felt, and when the head, chest, and limbs are covered with a cold, clammy sweat, dissolution is near. On the other hand, the favourable signs are, mildness of the paroxysm, diminution of the symptoms after the exhibition of the appropriate remedies, and more especially restoration to consciousness, return of the power of voluntary motion, with a calm and soft pulse, a gentle, warm, and general perspiration, and a spontaneous flow of blood from the nose, the rectum, and so on.

Causes.—The causes of the disease are either predisposing or exciting. The *predisposing* causes are, 1. Sex. It is decidedly more common in the male than in the female, because the male is more exposed to the exciting causes, and nothing so surely generates a predisposition to the disease, as the long-continued operation of an exciting cause. 2. Age. It may occur in childhood and youth: it is indeed rare in the former, but it is not uncommon in the latter; still, however, the great majority of cases without doubt occur at the more advanced stages of life. The period commonly conceived to be that in which it most frequently occurs, is the interval between forty and seventy. Out of

sixty-three cases, two were between twenty and thirty years of age; eight from thirty to forty; seven from forty to fifty; ten from fifty to sixty; twenty-three from sixty to seventy; twelve from seventy to eighty; and one from eighty to ninety years. 3. Conformation of the body. The large head, short neck, full chest, sanguine and plethoric temperament, have from time immemorial been considered as forming the apoplectic constitution, and though the disease may and often does occur in the very opposite states of the system, yet there cannot be a question that the conformation of the body just described is peculiarly favourable to the formation of that pathological condition of the brain on which, as we have seen, the malady depends. 4. Mode of life. Luxurious living, especially combined with sedentary habits, is a most powerful predisposing cause. 5. Suppression of accustomed evacuations, namely the suppression of the piles, or of discharges from the skin, whether from the sudden disappearance of eruptions, the result of natural disease, or the drying up of a seton or issue. 6. Mental states. Violent emotion: cases continually occur in which persons drop down suddenly in a fit in a paroxysm of anger. Long-continued anxiety is almost as powerful an exciting cause as luxurious living. It is the common opinion that the studious are more prone to this disease than other classes: but this notion is ill-founded, for the evidence is complete that moderate intellectual labour is not only in a high degree conservative of the general health, but that it is more especially preventive of that peculiar condition of the brain on which apoplexy depends. The condition of all others most conducive to apoplexy is that in which at a somewhat advanced age the food habitually taken is large in quantity and rich and stimulating in quality, at the same time that the intellectual faculties are little excited; while the history of lawyers, judges, and philosophers, would indicate a remarkable exemption from this disease in all its forms.

The predisposing causes, of whatever nature, act either by favouring an habitual determination of blood to the brain, or by impeding its return from this organ, or by impairing its vital energy, while they favour a plethoric state of its vessels. Such a condition of the brain having been formed, the slightest exciting cause is often sufficient to produce an attack.

Among the most powerful *exciting* causes are intemperance in eating and drinking, violent emotions of mind, whatever determines the blood with undue impetus to the brain or impedes its return from it, such as great muscular exertion, dependant posture of the head, tight ligature around the neck, the use of the warm bath, and the like.

Both sets of causes, the predisposing and the exciting, bring about a paroxysm either by diminishing the vital energy of the brain, or by producing undue pressure on its substance.

Treatment.—The treatment of this disease must obviously vary with the pathological condition of the brain on which it depends. The skill of the physician consists in detecting what that pathological condition is, and in exactly adapting his remedies to it, which must differ widely according as he is called to treat a threatening or an actual paroxysm, or to prescribe for a patient subsequent to an attack. To enter into a discussion of the different remedies suited to the manifold states of the brain, and of the system, in the various forms and stages of this malady, would require a larger space than can be allotted to it in this work. There are not many parts of his science in which the physician is required to make such nice and difficult distinctions, and in which life so completely depends on the accuracy of his discrimination. At one time the vital energy of the brain is so far exhausted as of itself to threaten the total abolition of its functions; at another time the arterial action or the venous congestion is so great as to threaten an immediate effusion of serum or a large extravasation of blood. For states so opposite, opposite remedies must of course be required: but the difficulty at all times is to interpret the outward signs aright. If, together with the premonitory symptoms which have been enumerated, namely, drowsiness, giddiness, headache, and so on, there be a flushed countenance, a dull or suffused eye, a hot skin, a strong or full pulse, the abstraction of blood may be indispensable to the preservation of life; but if, on the other hand, the countenance be pallid and sunk, the pulse full, and the skin cool, the smallest blood-letting may utterly exhaust the vital energies of a brain already greatly depressed,

and the only chance of averting death may be the judicious employment of stimulating remedies. It is in clearly pointing out distinctions like these, and in guiding to the selection of the remedy appropriate to each, that science is the salvation of life. But such too are precisely the cases in which no skill on the part of the physician can succeed without the steady co-operation of the patient. The physician duly weighing the premonitory signs may foresee the impending danger, and give warning of it, and prescribe precisely the medicine and REGIMEN fitted to avert it; but if these are either altogether neglected or only partially followed, the disease will hold on its course and life be lost. And this loss of life is deplorably frequent from the neglect on the part of the patient of the appropriate remedies in the primary stage of the disease, when such remedies may be employed with almost certain success; and the same is true from the neglect of such remedies in the stage subsequent to an apoplectic paroxysm, although in this stage the best-concerted measures have a much less chance of securing their object.

For the same reason that it would be vain to attempt here to enter into the modifications of treatment required in the premonitory and the consecutive stages of the disease, it would be out of place to discuss the measures proper to be adopted in the paroxysm itself. The state both of the brain and of the system varies in every individual case, and safe, not to say successful treatment, must in every case be modified accordingly. It is only necessary to add here, that whenever a person is seized with a fit of apoplexy, he should be carried into a large room, the freest possible circulation of fresh air should be promoted around the body, which should be placed in the horizontal posture, with the head, however, considerably raised, all bandages should be taken from about the head and neck, and especially from about the neck; and a medical man should be sent for instantly. Every observer of such a case should bear in mind that the loss of life may be the consequence of the loss of a minute.

APOPHYGE, a term applied by architects, generally, to a concave surface lying between or connecting two flat surfaces not in the same plane, and particularly to a slight concavity which is almost invariably found to terminate the shaft of an Ionic or Corinthian column both above and below; immediately above the uppermost fillet of the congeries of mouldings called the base, and under the moulding or mouldings of the hypotrachelium or necking. In the latter case the apophyge is distinguished in the two positions as the lower and the upper. The more familiar English term for the same thing is, the *escape*; and in French, the apophyge is termed the *congé*. Apophyge is from a compound Greek word signifying a *flying off*.

A POSTERIO'RI. [See **A PRIORI**.]

APOSTLES (ἀπόστολοι, messengers, ambassadors, missionaries) were, according to Luke vi. 13, those twelve disciples whom Jesus chose from the number of his followers to be his companions, and whom he commissioned to preach his doctrines, first among the Jews only (Matt. x. 5; Luke ix. 2), and after his resurrection to the Gentiles also (Matt. xxviii. 19; Mark xvi. 15). Jesus said concerning apostles,

As my Father hath sent me, even so send I you. He breathed on them and said, Receive the Holy Ghost. Whosoever sins ye remit, they are remitted unto them, and whosoever sins ye retain, they are retained' (John xx. 21-23). The list of the apostles occurs Matt. x. 2; Mark iii. 16, &c.; Luke vi. 14, &c. The names of the apostles are, 'Simon, who is called Peter, and Andrew, his brother; James, the son of Zebedee, and John, his brother; Philip and Bartholomew; Thomas, and Matthew, the publican; James, the son of Alphaeus; and Lebbeus, whose surname was Thaddeus; Simon, the Canaanite; and Judas Iscariot, who also betrayed him.' After the death of Judas Iscariot, 120 disciples being assembled, Peter recommended the choice of another apostle. 'Of these men which have companied with us all the time that the Lord Jesus went in and out among us, beginning from the baptism of John, unto that same day that he was taken up from us, must one be ordained to be a witness with us of his resurrection. And they appointed two, Joseph, called Barsabas, who was surnamed Justus, and Matthias. And they prayed, Thou, Lord, which knowest the hearts of all men, show whether of these two thou hast chosen, that he may take part of this ministry and apostleship, from which Judas by transgression fell, that he might go to his own place. And they gave forth

their lots; and the lot fell upon Matthias, and he was numbered with the eleven apostles' (Acts i. 15-26). To these twelve apostles was afterwards added Saul, whose name among the Greeks was Paul, called to be an apostle of the Gentiles through the will of God (Gal. i. 1; Col. i. 1; Rom. xi. 13; Acts ix). By the instrumentality of St. Paul the Gospel was most effectually propagated. Barnabas (Acts xiv. 14) being an apostolic missionary is mentioned in the following manner: 'And when the apostles Barnabas and Paul heard, &c. From this passage we infer that the title *apostle* was not exclusively given to the immediate disciples of Jesus. Comp. Acts xiv. 4; Rom. xvi. 7.

APOSTLES, ACTS OF THE. The authenticity of this book has not been doubted: it constitutes the second part of the Gospel according to St. Luke, which he dedicated to Theophilus (Luke i. 1; Acts i. 1). The Acts belong to the *Homologoumena*, or those canonical books which were, by all parties, recognized as genuine (Euseb. *Hist. Ecclesiastica*, iii. 25). The Severians (Eusebii, *Hist. Eccles.* iv. 29) and the Manicheans (Augustin. *Epist.* 23) acknowledged the authenticity of the Acts, although they rejected, for doctrinal reasons, their authority. Although the authenticity of the Acts was well established, they were less read among the lower classes, and accordingly Chrysostomus, at the end of the fourth century, wrote at the commencement of his *Commentary to the Acts*, 'Many do not know even the existence of this little book, nor him who wrote and composed it.'

The time at which St. Luke wrote the Acts may be gathered from the following circumstances. The arrival of St. Paul in Rome took place in the spring of about the year A.D. 63. Since this arrival is mentioned in the Acts, they must have been written after the year 63; and since the death of St. Paul, about the year 68 or 69 is not mentioned by St. Luke, the Acts were probably composed and circulated before this date. Theophilus, to whom the Acts were dedicated, may be considered as the representative of the inquiring heathen; consequently, it was proper that the Acts should be written, as they are, in the Greek language.

The interpretations of the Acts by Clemens Alexandrinus in the *Hypotyposes*, and the commentaries of Origen, Diodorus of Tarsus, Theodorus of Mopsuestia, have been lost. The *Fifty-five Homilies* of St. Chrysostomus on the Acts are still extant. There exist commentaries by Eusebius and Theophylactus. In the works of Grotius, Wolf, and others, on the *New Testament*, the Acts also have been explained. Limborch published his great work on the Acts at Rotterdam, 1711; and Waleh his *Dissertationes in Acta Apostolorum* at Jena, 1756-1761, 3 vols. Besides these the following commentators may be mentioned: Murus, ed. Dindorf, Lips. 1791, 2 vols.; Thiess, *Uebersetzung mit Anmerkungen*, Lips. 1800; Heinrich's *Acta Apostolorum, Annotatione perpetua illustrata*, Göttingae, 1809; Kuinoel, Lips. 1818. Stier has written a work on the speeches contained in the Acts, (*Ueber die Reden in der Apostelgeschichte*, 2 vols. Lips. 1829, 1830.) The author endeavours to show the logical arrangement in these speeches. *Die Apostelgeschichte von Lucas erläutert von Michael Wirth*, 2 vols. 8vo. Ulm, 1831-32. 8vo. That Matthew Henry, Wesley, Dodd, Coke, Scott, Benson, Adam Clarke, and other English commentators of the whole Bible, or of the New Testament, have not omitted the Acts, is generally known.

According to Sanelemente and Ideler, the dates in the Acts are as follows: Stephen was stoned A.D. 35. Paul converted between 35 and 38. St. Paul's first journey to Jerusalem (Act ix. and Gal. i. 18) between 38 and 41. The second journey (Acts xi. 12) in the year 44. The third journey (Acts xv.) in the year 52. The fourth journey (Acts xviii. 22) in the year 56. The fifth journey to Jerusalem and captivity of St. Paul in the year 60. Voyage to Rome, 62. Arrival in Rome in the spring of A.D. 63.

APOSTOLIC FATHERS, are those teachers of the Christian church who distinguished themselves during the first two centuries, and derived their Christian knowledge from personal acquaintance with the apostles. [See **CLEMENS ROMANUS**, **IGNATIUS** of Antiochia, **POLYCARPUS**, **HERMAS**, **BARNABAS**.]

APOSTO'LICI, were imitators of the apostolic life mentioned by Epiphanius. (*Hæres.* 67.) In the middle ages they were called Cathari. Some of them indulged Manichean speculations, and others distinguished themselves only by

their obedience to the moral doctrine of the *New Testament*. The latter, called Apostolic Brothers, were very numerous on the banks of the Lower Rhine, about the middle of the twelfth century. We learn from a letter written A.D. 1146, in which Everwin, ecclesiastical provost of Steinfeld, exhorts St. Bernhard, of Clairvaux, to confute these heretics, that they rejected oaths, infant baptism, fasts, ceremonies, worship of saints, purgatory, masses, second marriages, the power of the pope, &c. Some of them were brought before the ecclesiastical court of the archbishop of Cologne, and defended themselves by biblical quotations. After a disputation of three days, being still unconverted, the people dragged them to the flames, in which they died manfully.

Another apostolic brotherhood was founded by Gerhard Segarelli of Parma about A.D. 1260. This brotherhood Pope Nicolas IV. endeavoured to suppress by various decrees of 1286 and 1290. Nevertheless Segarelli and his adherents spread through Italy, Germany, France, and Spain. They went about accompanied by women singing, and preaching especially against the corruptions of the clergy. In 1291, two brothers and two sisters were burnt alive at Parma. Segarelli abjured his heresy, but was burnt in 1300 for having relapsed. From this time Doleino of Milan became the head of this party, who predicted the sudden downfall of the Romish church. Doleino divided the development of Christianity into four dispensations, the last of which began with his apostolic order. Doleino escaped from the inquisitors into Dalmatia, but returned to Italy in 1301. He fortified, with 1400 followers, a mountain in the diocese of Novara, near the village Balmara, and plundered, for his support, the adjacent country. In 1306 he fortified the mountain Zebello in the diocese of Verelli, and fought against the troops of the bishop, until he was compelled by famine to surrender in 1307. Doleino and his companion Margaretha of Trent were burnt with many of their followers. These Apostolici rejected the authority of the Pope, cath, capital punishments, &c. Some Apostolic Brothers are mentioned A.D. 1311, near Spoleto; and A.D. 1320, in the south of France. The synod of Lavaur, 1328, mentions them for the last time.

APOTROPHÉE (ἀποτροφή). A turning away, 'a sudden change in our discourse, when, without giving previous notice, we address ourselves to a person or thing different from that to which we were addressing ourselves before.' (Beattie, *Elements of Moral Science*.) The term is also used, less properly, for an address to some absent or inanimate object, as in *Julius Cæsar*, Act iii. Sc. I.

O pardon me, thou bleeding piece of earth,
That I am meek and gentle with these butchers.

It is also used to express the contraction or division of part of a word, as *born* for *borough*, *learn'd* for *learned*. This practice of division, intolerable in a language already overburdened with consonants, was much more frequent in the writers of a century, or a century and a half ago, than now; and seems to have been affected to give an air of negligence and familiarity to their style. It ought seldom to be used except in verse, and very sparingly there. The comma, by which the final *s* of the genitive case is separated from the word, is also called an apostrophe, as in 'Israel's monarch.'

APOTACTITES. [See **HERETICS**.]

APOTHECARIES (COMPANY OF), one of the incorporations of the city of London. In England, in former times, an apothecary appears to have been the common name for a general practitioner of medicine, a chief part of whose business it was, probably in all cases, to keep a shop for the sale of medicines. In 1315, a person of the name of Coursus de Gangeland, on whom Edward III. then settled a pension of sixpence a day for life, for his attendance on his Majesty some time before while he lay sick in Scotland, is called in the grant, printed in Rymer's *Fœdera*, an apothecary of London. But at this date, and for a long time after, the profession of physic was entirely unregulated. It was not till after the accession of Henry VIII. that the different branches of the profession came to be distinguished, and that each had its province and particular privileges assigned to it by the law. An act of parliament was passed in the third year of that king (1511), by which, in consideration, as it is stated, of 'the great inconvenience which did ensue by ignorant persons practising physic or surgery, to the grievous hurt, damage, and destruction of many of the king's liege people,' it was ordered that no one should practise as surgeon or physician in the city of London, or

within seven miles of it, until he had been first examined, approved, and admitted by the Bishop of London, or the Dean of St. Paul's, who were to call in to assist them in the examination 'four doctors of physic, and of surgery other expert persons in that faculty.' In 1518, the physicians were for the first time incorporated, and their college founded, evidently with the view that it should exercise a general superintendence and authority over all the branches of the profession. In 1540, the surgeons were also incorporated, and united, as they continued to be till the beginning of the present century, with the barbers. The two associations thus established appear, however, to have very soon begun to overstep their jurisdiction. It was found necessary, in 1543, to pass an act for the toleration and protection of the numerous irregular practitioners, who did not belong to either body, but who probably formed the ordinary professors of the healing art throughout the kingdom. In this curious statute, the former act of 1511 is declared to have been passed, 'amongst other things, for the avoiding of sorceries, witchcraft, and other inconveniences; and not a little censure is directed against the licensed and associated surgeons for the mercenary spirit in which they are alleged to have acted, while much praise is bestowed upon the unincorporated practitioners for their charity in giving the poor the benefit of their skill and care, and for the great public usefulness of their labours generally. The import of the enactment is expressed in its title, which is, 'An Act that persons being no common surgeons may minister outward medicines.' The persons thus tolerated in the administration of outward medicines, of course comprehended those who kept shops for the sale of drugs, to whom the name of apothecaries was now exclusively applied. The acceptance of the name, as thus confined, may be gathered from Shakspeare's delineation of the apothecary in *Romeo and Juliet* (published in 1596 or 1597), as one whose business was 'culling of simples,' who kept a 'shop,' the 'shelves' of which were filled with 'green earthen pots,' &c., and who was resorted to as a dealer in all sorts of chemical preparations. Nothing is said of his preparing medicines; and it certainly was not till nearly a century later that apothecaries in England, as distinguished from physicians and surgeons, ever began to act as general practitioners.

Meanwhile, however, the apothecaries of London were incorporated by James I. on the 9th of April, 1606, and united with the Company of Grocers. They remained thus united till the 6th of December, 1617, when they received a new charter, forming them into a separate company, under the designation of the Master, Wardens, and Society of the Art and Mystery of Apothecaries of the City of London. This is the charter which still constitutes them one of the city companies, although various subsequent acts of parliament have materially changed the character of the society.

It appears to have been only a few years before the close of the seventeenth century, that the apothecaries, at least in London and its neighbourhood, began generally to prescribe, as well as to dispense, medicines. This encroachment was strongly resisted by the College of Physicians, who, by way of retaliation, established a dispensary for the sale of medicines to the poor at prime cost in their hall in Warwick Lane. A paper controversy of great animation rose out of this measure; but the numerous tracts which were issued on both sides are now all forgotten, with the exception of Garth's burlesque epic poem, entitled *The Dispensary*, first published in 1697. The apothecaries, however, may be considered as having made good the position they had taken, although for a considerable time their pretensions continued to be looked upon as of a somewhat epy vocal character. Addison, in the *Spectator*, No. 195, published in 1711, speaks of the apothecaries as the common medical attendants of the sick, and as performing the functions both of physician and surgeon. After mentioning blistering, cupping, bleeding, and the inward applications employed as expedients to make luxury consistent with health, he says, 'The apothecary is perpetually employed in countermineing the cook and the vintner.' On the other hand, Pope in his *Essay on Criticism*, published the same year, has the following lines in illustration of the domination which he asserts to have been usurped by the critic over the poet:—

'So modern 'pothecaries, taught the art
By doctors' falls to play the doctor's part;
Bold in the practice of mist, ven rules,
Prescribe, apply, and ead their masters' foals.'

Nor, indeed, did the apothecaries themselves content at this time for permission to practise as medical advisers and

attendants any further than circumstances seemed to render it indispensable. In a cleverly written tract in their defence, published in 1724, and apparently the production of one of themselves, entitled '*Pharmacopolæ Justificati; or the Apothecaries Vindicated from the Imputation of Ignorance, wherein is shown that an academical education is unwise necessary to qualify a man for the practice of physic*,' we find the following opinion expressed (p. 31), 'As to apothecaries practising, the miserable state of the sick poor, till some other provision is made for their relief, seems sufficiently to warrant it, so long as it is confined to them.' We may here observe, that the custom of persons being licensed by the bishops to practise medicine within their dioceses continued to subsist at least to about the middle of the last century. It is exclaimed against as a great abuse in a tract entitled *An Address to the College of Physicians*, published in 1747.

It has been stated in various publications, that the order of dealers in medicines, known as chemists or druggists, first made their appearance about the end of the last century, or not much more than forty years ago. As they immediately, or at least very soon, began to prescribe as well as to dispense, the rivalry with which they were thus met was as eagerly opposed by the regular apothecaries, as their own encroachments had in the first instance been by the physicians. In certain resolutions passed by a meeting of members of the Apothecaries' Company on the 20th of November, 1812, among other causes which are asserted to have of late years contributed to degrade the profession, is mentioned the intrusion of pretenders of every description: 'Even druggists,' it is said, 'and their hired assistants, visit and administer to the sick; their shops are accommodated with what are denominated private surgeries; and, as an additional proof of their presumption, instances are recorded of their giving evidence on questions of forensic medicine of the highest and most serious import!' But in all this the druggists really did no more than the apothecaries themselves had begun to do a hundred years before. We doubt, too, if the first appearance of these interlopers was so recent as has been assumed. We find a tract, printed on a single folio leaf 'at the Star in Bow Lane in 1683,' entitled *A Plea for the Chemists or Non-Collegiats*, in which the author, Nat Merry, stoutly defends the right of himself and the other manufacturers of chemical preparations to administer medicines, against the objections of the members of the Apothecaries' Company, who seem to have been themselves at this time only beginning to act as general practitioners. And in 1708, we find a series of resolutions published by the Court of Apothecaries, in which they complain of the intrusion into their business of foreigners—that is, of persons not free of the company. Their charter, though it appeared to bestow upon them somewhat extensive privileges, had been found nearly inoperative from the omission of any means of executing its provisions, and of any penalties for their infringement. In 1722, therefore, an act of parliament was obtained by the company, giving them the right of visiting all shops in which medicinal preparations were sold in London, or within seven miles of it, and of destroying such drugs as they might find unfit for use. This act expired in 1729; and although an attempt was made to obtain a renewal of it, the application was not persevered in. But in 1748 another act was passed, empowering the society to appoint ten of their members to form a court of examiners, without whose license no one should be allowed to utter medicines in London, or within seven miles of it. It was stated before a Committee of the House of Commons, that there were at this time about 700 persons who kept apothecaries' shops in London, not one-half of whom were free of the company. But this act probably had the effect of putting the unlicensed dealers down; which may account for the common statement, that no such description of dealers ever made their appearance till a comparatively recent period. In an Introductory Essay prefixed to the first volume of the *Transactions of the Associated Apothecaries and Surgeons of England and Wales* (8vo., London, 1823), in which it is admitted that antiently 'the apothecary held the same situation which appertains, or ought to appertain, to the present druggist, who arose,' it is affirmed, 'about thirty years ago,' the following remark is added, 'For some time previous to that period, indeed, certain apothecaries existed who purely kept shop, without prescribing for diseases; but very few of these existed even in London; for in the memory of a physician lately dead, there

were not more, as he stated, than about half-a-dozen persons in London who kept what could be called a druggist's shop.'

Up to within the last few years the Company of Apothecaries had never attempted to extend their jurisdiction beyond the metropolis and its immediate neighbourhood. But in 1815, an act of parliament was passed, which placed the society in altogether a new position, by giving to the Court of Examiners, then increased to twelve members, the sole right of examining and licensing apothecaries throughout England and Wales. It was enacted, that after the 1st of August in that year, no person not so licensed should practise as an apothecary, except such only as were already in practice. It was also made imperative that candidates for examination should have previously served an apprenticeship of at least five years with a member of the company.

The history of the steps taken to procure this act is very minutely detailed in the Essay prefixed to the *Transactions of the Associated Apothecaries and Surgeons*, already referred to. The application was commenced, and indeed principally carried through, by this private society; the Colleges of Physicians and Surgeons, and the Apothecaries' Company themselves, having declined joining in it. The act, however, fell in one material respect very far short of the design entertained by its projectors, inasmuch as the opposition of the chemists and druggists rendered it necessary to introduce a clause into it exempting that class of dealers altogether from its operation.

From the circumstance that in country places, with very few exceptions, no person can practise medicine without keeping a supply of drugs for the use of his patients, or in other words, acting as an apothecary, this statute has given to the Society of Apothecaries the complete control of the medical profession throughout England. Every general practitioner must not only have purchased their license, but must have served a long apprenticeship with a member of the company. The price of a license to practise in London or within ten miles of it, is ten guineas, and in any other part of the country six guineas. The penalty for practising without this license is twenty pounds. It is expressly declared in the act that the society may appropriate the moneys which they thus receive in any way they may deem expedient. It appears by a published list, that from the 1st August, 1818, when the new act came into operation, to the 31st July, 1832, about 1600 practitioners had been licensed by the Court of Examiners. We have not been able to find any account of the number of rejected applicants. From a return, printed by order of the House of Commons last session, it appears that from the 29th March, 1825, to the 19th June, 1833, the money received by the company for certificates was 22,822*l.* 16*s.* Of this, in the course of the eight years, 10,218*l.* 12*s.* had been paid to the members of the Court of Examiners, besides 980*l.* to their secretary.

It is right to state that the parties by whom the act was sought did not originally contemplate the giving of these extensive powers to the Apothecaries' Company. In one of their first reports, dated the 5th of December, 1812, the committee of management express themselves as of opinion 'that the management of the sick should be as much as possible under the superintendence of the physician;' and it was then proposed that a new and a distinct privileged body should be created to examine and license practitioners, composed of members of all the different branches of the profession. This scheme, however, was abandoned when both the Colleges of Physicians and Surgeons refused to co-operate in getting it carried into effect.

Before this act came into operation a large proportion of the medical practitioners in country places throughout England were graduates of the Universities of Edinburgh, Glasgow, and Dublin, or licentiates of the Royal Colleges of Surgeons of these cities, or of that of London, none of whom obtained their degrees or certificates without passing through a long course of study and a rigorous examination. Persons thus qualified are admitted as surgeons in the army and navy, and into the service of the East India Company; but they are no longer allowed to act as country practitioners in England. This privilege can only be obtained by a service of five years in the shop of a practitioner who is a member of the Company of Apothecaries, and by undergoing an examination in London before the Court of Examiners.

Except in regard to experience in the compounding of medicines, it is not denied that, until very lately, the course

of education prescribed by the Company's Court of Examiners was of an extremely inferior description. For this we have their own avowal. In their regulations, dated August 1832 (the last issued, we believe), referring to the improved system which had been introduced only the preceding year, they say, 'The medical education of the apothecary was heretofore conducted in the most desultory manner; no systematic course of study was enjoined by authority or established by usage; some subjects were attended to superficially, and others of great importance were neglected altogether.' In fact, all the attendance upon lectures and hospital practice that was demanded, might have been and often was gone through in six or at most in eight months. The court admits that still 'the attendance upon lectures, but more especially upon the hospital practice, is often grossly eluded or neglected.'

The course prescribed in 1832 for those whose attendance on lectures had commenced on or after January in the preceding year, comprehends two courses of chemistry, two of materia medica and therapeutics, two of anatomy and physiology, two of anatomical demonstrations, two of the principles and the practice of medicine, two of midwifery and the diseases of women and children, one of botany, and one of forensic medicine; together with twelve months' attendance on clinical lectures in an hospital. Most of these courses are to comprehend at least forty-five lectures; and the whole, with the hospital attendance, are to occupy two years.

Notwithstanding this reform, a strong feeling of dissatisfaction has continued to prevail in many quarters at the exclusion from the right to practise of all persons except those who have served an apprenticeship of five years with an apothecary; and a bill was last session brought into the House of Commons to remove this disability. It was withdrawn in consequence of some difference of views as to a minor point among the parties by whom it was promoted; but it is understood that it will be again brought forward during the present session (1834). The object was not to take the right of examination and license from the Court of Examiners of the Apothecaries, but to permit the licentiates of the Scotch and Irish universities, and of the Colleges of Surgeons, to practise in England, as well as those who have the diploma of the Apothecaries' Company.

In respect to this proposed reform, we have only to observe, that the legislature cannot make any change in the present state of the law which regulates the practice of apothecaries in England without a full and impartial inquiry. Whatever may be the result of this, we believe it will be shown that the examinations of the court have been progressively improving, and that the attainments of the successful candidates are very much higher than those possessed by medical practitioners at the time of passing the act of 1815, and indeed than those required by the society soon after the act came into operation. That the examination is not a mere matter of form is shown by the number of pupils rejected: out of the 6227 who were examined from 1815 to 1831 inclusive, 680 were rejected by the court. In the year 1831-1832, nearly one-sixth, and in the year 1830-1831, nearly one-fourth, of the candidates were rejected. The rejected candidates no doubt frequently obtain their diplomas at a subsequent examination, after preparing themselves better; but the fact of so many being rejected is creditable to the Court of Examiners, as, in the present defective state of the early education of medical students, every body knows that a large number of them cannot possibly pass a satisfactory examination. No fees are paid by the rejected candidates. (See *A Reply to the Statement in Support of a Petition of the Royal College of Surgeons of Edinburgh*.)

We ought not to omit to mention that the Apothecaries' Society, in their interpretation of the clause which requires five years' apprenticeship to an apothecary, have considered that 'every candidate who has been an apprentice for the length of time directed by the act, is entitled to be examined, provided the person to whom he was an apprentice was legally qualified to practise as an apothecary according to the laws in force in that kingdom or particular district in which he resided; and in accordance with this interpretation, hundreds of candidates have been admitted to examination who have served their apprenticeships in Scotland and Ireland, as well as many from America and the British colonies.' (See *Reply*, &c. p. 3.) Of twenty-four graduates and licentiates of the Scottish colleges who presented themselves for examination before the Society of

Apothecaries during the twelve months ending the 25th of April, 1833, eight candidates, or one-third of the whole number, were rejected. (*Reply*, &c.) The whole subject of medical education in these kingdoms requires a complete and impartial investigation; and that the apprentice clause in particular demands a fresh consideration, is now a pretty general opinion. The admission of graduates from Scotland and Ireland to an equal participation of practice with the English general practitioner, can only be regarded as a very partial measure of reform, if reform should be found necessary; and the interests of the public require, that, if others than those licensed by the Apothecaries' Society are admitted to general practice in England, there shall at least be good proof that they are as well qualified as those who obtain the apothecaries' diploma.

The Apothecaries rank as the fifty-eighth in the list of City companies. The members of the society are exempted by statute from serving ward and parish offices. Their arms are, azure, Apollo in his glory, holding in his left hand a bow, in his right an arrow, bestriding the serpent Python; supporters, two unicorns; crest, a rhinoceros, all or; motto, *Opiferaque per orbem dicor*. They have a hall in Water-lane, Blackfriars, at which medicines are sold to the public; and where all the medicines are prepared that are used in the army and navy. They also possess a garden, to which every medical student in London is admitted, of above three acres in extent, at Chelsea, in which exotic plants are cultivated. The ground was originally devised to them, in 1673, for sixty-one years at a rent of five pounds, by Charles Cheyne, Esq., lord of the manor of Chelsea, and afterwards granted to them in perpetuity, in 1721, by his successor Sir Hans Sloane, on condition that they should annually present to the Royal Society, at one of their public meetings, eighty specimens or samples of different sorts of plants, well-cured and of the growth of the garden, till the number should amount to two thousand. This they have done, and the specimens are preserved by the Royal Society. They still observe an old custom of making every summer a number of *herbarizing* or *simplic* excursions to the country, which are now, we believe, so conducted as to be valuable botanical lessons to the apprentices or pupils by whom the members of the society are accompanied on these occasions. The society gives every year a gold and a silver medal to the best-informed students in botany, who have attended their garden. The apprentices of members of the society are not permitted to contend with other candidates for these prizes.

APOTHEOSIS (*ἀποθῆσις*, a deification, literally, a god-making), the enrolment of a mortal among the Gods. The mythology of Greece is full of instances of this: it is sufficient to call to mind Minos, Hercules, and other heroes, who received divine honours. It was one of the doctrines of Pythagoras, that good men after death were raised into the order of gods. To exalt fellow-men to this extent, however, was foreign to the disposition of republican states; and, therefore, though the Greeks always held in high respect the heroes of antient times, we hear of no deifications from the time when a republican form of government became prevalent in Greece, until the spirit of independence was broken, and the Greeks became as obsequious to kings and princes, as they had formerly been unbending. There is, however, an example to the contrary recorded by Herodotus (v. 47):—the people of Egæstæ built an *heroon* to Philippus, though he fell in battle against them, and offered sacrifices to him, as Herodotus himself testifies; it was on account of his *beauty* that he was deified. Alexander, according to some rather doubtful stories, not only claimed divine parentage, but a divine nature while on earth; and the compliment of deification was commonly paid to the princes of the various dynasties who succeeded to his empire. On the coins of the Seleucidæ we often find the word 'God' (*Θεός*). In Rome, also, we find Romulus raised to the rank of a god; but there are no instances of Romans admitted to the rank of deity, from the expulsion of Tarquin, until the empire of the Cæsars. Julius Cæsar was worshipped as a god after his murder. Augustus, while yet alive, was declared the tutelary god of all the cities of the empire, and the succeeding emperors after death were enrolled among the numerous tenants of heaven. It is to the death and reception of Julius Cæsar into heaven, that the 5th *Eclogue* of Virgil is by some supposed to refer.

The term *Apotheosis*, however, is more especially used to signify the ceremony by which the Roman emperors were

admitted, if we may use the expression, after death to divine honours. This is minutely described by Herodian (*lib. iv. c. 3.*), and the passage presents so curious a picture of the absurdities into which an idolatrous religion betrayed its votaries, that we translate it here. 'It is the custom of the Romans to deify those of their emperors who die, leaving successors; and this rite they call *apotheosis*. On this occasion, a semblance of mourning, combined with festival and religious observances, is visible throughout the city. The body of the dead they honour after human fashion, with a splendid funeral; and making a waxen image in all respects resembling him, they expose it to view in the vestibule of the palace, on a lofty ivory couch of great size, spread with cloth of gold. The figure is made pallid, like a sick man. During most of the day senators sit round the bed on the left side, clothed in black; and noble women on the right, clothed in plain white garments, like mourners, wearing no gold or necklaces. These ceremonies continue for seven days; and the physicians severally approach the couch, and looking on the sick man, say that he grows worse and worse. And when they have made believe that he is dead (*ἵπῳ ἢ ὄξυ παραδυσκίνας*), the noblest of the equestrian and chosen youths of the senatorial orders take up the couch, and bear it along the Via Sacra, and expose it in the old forum. Platforms like steps are built on either side; on one of which stands a chorus of noble youths, and on the opposite, a chorus of women of high rank, which sing hymns and songs of praise (*ὑμνοὶ καὶ παιάνας*) to the deceased, modulated in a solemn and mournful strain. Afterwards they bear the couch through the city to the Campus Martius: in the broadest part of which, a square pile is constructed entirely of logs of timber of the largest size, in the shape of a chamber, filled with faggots, and on the outside adorned with hangings interwoven with gold and ivory images and pictures. Upon this, a similar, but smaller chamber is built, with open doors and windows, and above it, a third and fourth, still diminishing to the top, so that one might compare it to the light houses, which are called *Phari*. In the second story they place a bed, and collect all sorts of aromatics and incense; and every sort of fragrant fruit or herb or juice; for all cities and nations and persons of eminence, emulate each other in contributing these last gifts in honour of the emperor. And when a vast heap of aromatics is collected, there is a procession of horsemen and of chariots around the pile, with the drivers clothed in robes of office, and wearing masks made to resemble the most distinguished Roman generals and emperors. When all this is done, the successor to the empire applies a torch to the building; and others set fire to it on every side, which easily catches hold of the faggots and aromatics. And from the highest and smallest story, as from a pinnacle, an eagle is let loose to mount into the sky as the fire ascends; which is believed by the Romans to carry the soul of the emperor from earth to heaven; and from that time he is worshipped with the other gods.' Compare with this description Dion's account (book 74.) of the funeral ceremonies of Pertinax.

In conformity with this practice, it is common to see on medals struck in honour of an apotheosis, an altar with fire on it, and an eagle taking its flight into the air. Several representations of real or supposed apotheoses have been preserved in ancient gems and sculptures; of which the most celebrated is the apotheosis of Homer, formerly in the Colonna palace at Rome, but now in the Townley gallery of the British Museum. This monument has been illustrated by some of the most eminent of modern scholars. Montfaucon has published the apotheosis of Romulus in the third volume of the supplement to his *Antiquities*. See a remark on the apotheosis of Augustus, under *onyx*, in the article AGATE.

APO'TOME, in ancient Greek music (from *ἀπό*, *from*, and *τέμνω*, *to cut*), the remainder of a whole tone when diminished by a *limma* [see LIMMA], or smaller semitone, the ratios being 2187 and 2048. The Greeks were aware that the tone-major could not be rationally divided into two equal parts: they therefore divided it into a greater and less semitone, which they called *apotome* and *limma*, the difference whereof is a *comma*. [See COMMA.] Under the heads **TONE**, and **SCALE, MUSICAL, OF THE GREEKS**, will be found further information concerning the ancient manner of dividing the octave.

APPALACHE, a bay in the Gulf of Mexico, formed by the coast of West Florida, and a line joining Cape St.

George, the most southern point of the Appalachicola delta, with the outlet of the Suwanne river. It receives the Ocklockonne, St. Mark's, and a few other inconsiderable streams.

APPALACHIAN MOUNTAINS. The mountain system which runs along the eastern side of the continent of North America, is generally known, in this country, by the name of the Alleghanies: but these are, in fact, only a subordinate chain; and modern geographers in the United States have adopted the general term of the *Appalachian System* for the whole mass. They were called the *Appalaches*, or Appalachian Mountains, by the French, who first became acquainted with them at their southern extremity, from the Indian name of a river which flows into the Gulf of Mexico, in Appalache bay; but the English, who visited them principally in their more northern parts, preserved the Indian name there given of Alleghanies, which is supposed to mean the *Endless*.

The Appalachian system consists of numerous parallel chains, some of which form detached ridges, extending, in most instances, in the same direction as the entire system which they contribute to form. Taken as a whole, it has a range which does not deviate materially from N.E. to S.W., and it extends about 1200 miles in length. The northern and southern extremities of this mountain system are not well defined, but the elevations which form a part of the whole system may be traced from the state of Maine into Alabama. The most remarkable chains are, the Blue Ridge, which lies nearest to the Atlantic, and stretches from the state of Georgia to its intersection by the Delaware River, but no very exact limit to the name of this range is laid down: the Kittatinny Chain: the Alleghany Mountains, in the western part of Virginia and the central parts of Pennsylvania; the Cumberland Mountains, on the eastern boundary of Tennessee and Kentucky; the Catsbergs, or Catskill Mountains, in the state of New York; the Sacandago Chain, which is a continuation of the Catsbergs; the Green Mountains, in the state of Vermont; the Highlands, eastward of the Hudson River; and the White Hills in New Hampshire. In the whole of the Appalachian system, there are no great detached mountain peaks: the greatest elevations are in the White Hills of New Hampshire, where Mount Washington, according to the measurements of Captain Partridge, rises to the height of 6634 feet above the sea, its base being at an elevation of 1888. The summit is much below the limit of perpetual snow. Moosehillock, another of the White Hills, is 4636, and Grand Monadnoc, 3254 feet. In the Green Mountains, Killington Peak is 3924 feet above the sea; in the Catsbergs, Round Top is 3804, and the High Peak 3718 feet above the tide level of the Hudson, about 18 miles distant. The Peaks of Otter, in the Blue Ridge, Virginia, are said to be about 4000 feet above the sea level; though the general elevation of the Blue Ridge in Virginia is far below this height. Table Mountain, in South Carolina, is supposed to be not less than 4300 feet above the sea. Canawhee Mountain in Georgia, the southern extremity of the Blue Ridge, is 1500 feet.

The Appalachian Mountains do not form a high dividing line between the waters which flow into the Atlantic on one side, and into the Mississippi on the other. They cover a widely-extended area of about 100 miles in breadth, only one-third of which is occupied by the mountain chains, the rest being the intermediate valleys. The rivers which rise in the Appalachians, flow in long valleys between the chains, and are deflected sometimes to the east, and sometimes to the west, after passing nearly at right angles through depressions in the ridges, or through deep rents in the mountains, as at Harper's Ferry, in Virginia, where the united Potomac and Shenandoah cut the Blue Ridge at right angles. From the Connecticut River, the most northern of the great rivers belonging to the Appalachian system, to the Alamaha of Georgia, we find a series of large rivers which, originating within the Appalachian system, or on the margin of its eastern barrier, flow to the Atlantic. The line of the great water-shed, between the streams that run to the Atlantic, and those that flow into the gulf of Mexico, runs from the sources of St. John's River, on the north-western limit of the state of Maine, to the Point of Florida, almost following the inflection of the coast, but the mountain system crosses that line, at an angle of about 30°. The land between the sea-coast and the foot of the most eastern of the Appalachian chains, is of very unequal breadth; at

the Hudson River, the Atlantic almost washes the base of the mountains, but from that point southward, there is a gradual increase in the breadth of the Atlantic Slope, as it is called by the American geographers, as far as Cape Hatteras, in North Carolina, and from that point to the mouth of the Altamaha in Georgia, the coast runs nearly parallel to the mountains, at a distance of about two hundred miles.

The western slope of the Appalachian system falls by a gentle but broken descent to the Mississippi; it is upwards of 1000 miles in length, and about 300 miles in width, from the river to the base of the mountains, covering an area of about 300,000 square miles, unbroken by any other than gently rising hills, but deeply furrowed by rivers over its whole surface. Nowhere can the wearing effects of rivers be more advantageously studied, for their channels do not appear to have been formed by rents and dislocations of the ground, the strata being usually horizontal, but by the erosion of a stream. The hills parallel to the Appalachian system on the western slope consist, in their lower parts, of transition slate and limestone, in highly inclined beds, which are covered near their summits by coal-measures and superior secondary formations, in unconformable and horizontal stratification. Hills, separated by valleys several miles wide, are composed of the same horizontal strata, the identity of the beds on both sides of the valley being recognizable; it seems, therefore, a legitimate conclusion, that the strata were once continuous over the valley, and it is difficult to conceive how the gap could have been produced, in such circumstances, except by the scooping out of water acting with great force, and for a considerable period. Further observation, however, should be made before any positive opinion is adopted about the formation of these river valleys.

In the northern parts of the Appalachian system, a considerable tract of country is occupied by primary strata, such as gneiss, mica-slate, clay-slate, and granular limestone, associated with granites, serpentines, and traps, under various aspects, underlying and penetrating the strata. Grauwacke sandstone and slates, and transition limestones,

however, more abundant in this mountainous range than the primary strata. *Grauwacke slate* forms the western margin of the primary country of New York and New England, and also of the great body of the Alleghany Mountains and of the Catsbergs. It is still more widely extended in the north, occupying much of the surface in the state of Vermont, the northern parts of the state of New York, and Canada. In the Alleghany Mountains of Pennsylvania, Maryland, and Virginia, its beds are of great thickness, and form, in some instances, the prevailing rocks, being, however, almost invariably overlaid by sandstone. *Transition limestone* occurs over a great extent of country along the north-western side of the Alleghany chain, associated with the grauwacke slate, but generally inferior to it. It is found in Vermont alternating with grauwacke slate, and is separated from a secondary limestone in the valley of Lake Champlain by a red sandstone, which forms the upper part of a range of hills called the Snake Mountain. In the western part of Massachusetts, and along the eastern side on the Hudson River in New York, it lies upon primary clay-slate. North-east of the Hudson, this limestone nowhere occupies any great extent of country. Crossing the Hudson, and proceeding south-west, little of this limestone is seen in the lower part of New York, but it becomes more abundant in the western parts of New Jersey and Pennsylvania, and forms the lower part of the ridge in southern Pennsylvania and Virginia. According to Maclure, it extends nearly to the south-west termination of the mountains, between the Alabama and Tombekbe rivers. It contains many caves, some of which are of great extent, and in these caves fossil bones of various animals have been found. *Arenaceous and conglomerate grauwackes* are perhaps the most frequent forms in which the transition rocks present themselves, but what proportion of these are of the age of our old red sandstone has not yet been made out. A red sandstone partially covers the lower levels of the primary strata, from twelve miles south of Connecticut River to near the Rappahannock River in Virginia, a range of nearly 400 miles; and, though often interrupted, it retains a remarkable degree of uniformity throughout the whole distance. The sandstones, in highly-inclined beds, prevail very generally throughout the middle and eastern chains in Pennsylvania and Maryland. Near the summit of the

Alleghany Mountains, the grauwacke passes into a red sandstone, which is not in unconformable stratification, but gradually assumes a horizontal position.

In Pennsylvania there is a vast deposit of coal, associated with sandstones and slates, which American geologists have hitherto described as belonging to the transition or grauwacke series. The coal is usually termed anthracite by them, and seems to be of that quality which is generally called *blind coal* in Britain, and of which many beds in our regular coal-measures consist, in several situations, as in the South Wales Coal-basin. The great Pennsylvanian coal-fields are situated in the valleys of the Susquehanna, Lackawanna, and the Lehigh and Schuylkill rivers, the two last being alluents of the Delaware.

The natural beauties of these valleys seem destined at no distant period to be impaired by black smoking heaps, such as those which in our own country disfigure the valleys of the Tyne and the Wear. The coal-region along the Susquehanna River is in the valley of Wyoming, and runs up into the valley of its tributary the Lackawanna. It is between sixty and seventy miles long, by about five miles broad. The beds of coal break out in the face of the precipices, in the banks and beds of the rivers, and occur in several alternations with conglomerates, sandstones, and slates. In these sandstones and slates, as well as in the coal itself, there are numerous vegetable impressions, belonging to the fern tribe and others. From the description of these by Professor Silliman, coupled with the fact that balls of clay-ironstone accompany the strata, we are led to doubt whether these strata belong, as it has been said, to an earlier geological period than the regular coal measures in Europe.

The coal-region of the Lehigh River is chiefly wrought at a place called by an Indian name, Mauch Chunk. The coal here also forms alternating beds with sandstones and slates, and is extracted at the summit of a mountain 1500 feet above the level of the sea, in a quarry open to the day. The beds are usually from twenty to twenty-five feet thick, but in some places they swell out to fifty-four feet, and they are known to extend over many miles. These mines, together with others on the Schuylkill River, are an immense source of wealth to the state of Pennsylvania. They are now extensively wrought, and the coal is conveyed by railroads to the banks of the navigable rivers. They will have a powerful influence on the future condition of the United States, for there is enough to supply the whole country along the Atlantic shore for many ages. Deposits of the same kind of coal are wrought in Rhode Island, and in Worcester County in the state of Massachusetts. Bituminous coal, of the same sort with the regular coal-measures of Europe, is found in several places on the Atlantic Shore. About ten or twelve miles west of Richmond, in Virginia, Mr. Maclure says that there is such a deposit, from twenty to twenty-five miles long, and about ten miles wide; it is situated in an oblong basin, having a whitish freestone and slaty clay with vegetable impressions alternating with the coal. It lies upon and is surrounded by primary rocks. Bituminous coal is abundant also in Tioga County, in the state of New York. About one mile west of the summit of the Alleghany, on the road from Philadelphia to Pittsburg, the coal-measures appear, and descending into the valleys, the transition strata again emerge.

There are, in several other situations in the Appalachian system, very extensive deposits of bituminous coal; one of the most remarkable of which is in the vicinity of Pittsburg, on the Ohio, where it is associated with ironstone, as in Staffordshire, and, from very similar local advantages, a Birmingham for the United States has grown up at Pittsburg. A mountain group, called the Laurel Ridge, lies between Pittsburg and the Alleghanies, and is separated from the latter by a wide valley. Near the summit of the mountain are strata of sandstone and bituminous shale, alternating with coal, which is thick enough to be worked. These coal-measures are very little lower than the summit of the Alleghanies, and as they are horizontal, they must have been raised up from the bottom of the sea in a vertical direction to this great height; a circumstance which perhaps seems to indicate rather a gradual upheaving of the Appalachian system, than a sudden and violent action. The coal-mines near Pittsburg are opened along the sides of the hills at an elevation of 320 feet above the level of the Ohio, and the strata are quite horizontal. This coal-formation is believed to be of great extent, indications of it having been observed

100 miles above Pittsburg; but it is not very probable that it is uninterruptedly continuous over so great an extent.

Natural springs, extremely rich in salt, are found all along the western slope of the Appalachian system: and from Onondago, in New York, to Louisiana, wherever the earth has been penetrated to any considerable depth, salt water has been found; in some places, where the boring was from 300 to 400 feet, the water rushed up with so much force, as to rise like a fountain several feet above the surface of the ground. Salt works are established at intervals along the whole line of country from Onondago to within a short distance of Natchitoches in Louisiana, and the quantity annually made is immense. In the valleys of the Appalachian system there is a considerable number and variety of mineral waters, which are much resorted to during the summer months by invalids from all parts of the States. Thermal springs also occur, as in the county of Bath, in Virginia, the western boundary of which county is the Alleghany range.

No portion of the earth of equal extent possesses so many natural advantages for the advancement of civilized society, as the country between the Appalachian Mountains and the Mississippi; vast stores of coal, iron, limestone, and salt; the land intersected in every direction with navigable rivers, affording the utmost facilities for the construction of canals; and a direct communication by water with the sea. It can hardly fail, in the course of a few centuries, to be covered with flourishing towns and a dense population.

The secondary formations of Europe, between the coal-measures and the chalk, seem to be of very rare occurrence all along the Atlantic slope. In New Jersey and Delaware there is a very extensive deposit of an argillaceous marl, containing, however, but a small quantity of lime, which, from the included fossils, has been considered both by American and French geologists to be an equivalent, in point of age, to the chalk of Europe. It reaches from 38° to $40^{\circ}30'$ N. lat., having the ocean on the east, and being bounded on the west by primary strata, on the south by the tertiary deposits to be presently mentioned. It covers upwards of 4000 square miles, and is for the most part remarkably level. It is found in many places farther south, but covered by the tertiary strata.

From the foot of the most easterly range of the Appalachia Mountains a tract of low country, of variable breadth, extends to the shores of the Atlantic. By low we do not mean flat, for the surface is diversified by hills of moderate elevation, interspersed amid widely-extended plains. Mr. Maclure, and the American geologists who wrote fifteen years ago, described this as a vast tract of *alluvial* land; but more recent investigations, especially those of Dr. Morton, Professor Hitchcock, and Mr. Conrad, have shown that it is composed of a series of tertiary deposits. Three distinct formations have been made out, and have been called by Mr. Conrad the Lower, Middle, and Upper Tertiary, being distinguished from each other by including distinct species of fossil shells. The Lower contains chiefly extinct species, the Middle a mixture of extinct species with others still inhabiting the coasts of the United States; the Upper contains scarcely anything besides the remains of existing species. Following the principle of subdivision of the Tertiary deposits adopted by Mr. Lyell, the Lower formation may be Eocene, and the Middle formation may be Miocene, but the Lower may also belong to the Miocene period. The question turns upon the *relative proportions* of recent and extinct species among the fossil shells contained in the beds. There seems no doubt that the Upper formation belongs to the Newer Pliocene period. These formations collectively, according to Mr. Conrad, form the Atlantic margin of the United States, from Sandy Hook in New Jersey to the peninsula of Florida, from whence they skirt the Gulf of Mexico, to the waters of the Mississippi. The lower tertiary is met with at the western boundary of the Atlantic slope; the upper tertiary extends to the shores of the ocean. This last also occupies by far the greatest extent of surface, extending from 100 to 150 miles west from the sea. Thus we arrive at the remarkable conclusion, as has been observed by Mr. Murchison in speaking of Mr. Conrad's work on Tertiary Shells, that the vast portion of the American continent covered by the upper tertiary deposit, must have been raised from the bottom of the ocean since the time when the existing species of mollusca occupied the adjoining seas. It is stated by Mr. Conrad that on

fresh-water lacustrine formations have yet been discovered among the tertiary deposits of the United States. This is a remarkable fact; but as the space is vast and much covered by vegetation, and the careful and competent observers of geological phenomena have hitherto been few, we are perhaps hardly enabled as yet to say positively that they do not exist. These tertiary formations do not in all places occupy the surface; they are covered in many situations by great accumulations of gravel, sand, and other alluvium. In these have been found the remains of extinct quadrupeds, such as the mastodon in New Jersey and North Carolina, the megatherium in Georgia, and extinct species of the elephant in several places.

Among the unstratified rocks, granites, sienites, and serpentines occur abundantly in the Northern States, and in detached localities; but less frequently as far as the southern extremity of the mountain system.

Trap rocks of different kinds are found in many places, and sometimes in the form of columnar basalt, but there is not a trace of recent volcanic action throughout the whole of the Appalachian system.

There are both iron and lead mines, but the produce of neither has hitherto been very considerable. Gold has been found rather abundantly in the states of North Carolina and East Tennessee. The gold country of North Carolina, according to Professor Olmsted, lies on the southern side of the state, and is spread over a space of not less than a thousand square miles. The prevailing rock is a clay slate, which forms a zone more than twenty miles wide; it has interstratified beds of siliceous slate, and both are traversed by quartz veins. It is in these veins that the gold appears to exist, but almost all that is found is in the form of grains and detached lumps of various sizes in the alluvium which covers the rocks. It has been found, within these few years, in considerable quantities in the mountainous parts of the state of Georgia, not only in the alluvium, but also in veins in the rocks; usually in quartz veins, in tale slate, and mica slate, accompanied by iron pyrites. There have been found in Georgia the remains of works, which were carried on by some people before the arrival of Europeans, consisting of a shaft and excavations in a large quartz vein, with part of a furnace, and some tools.

In the natural state of the country, that is, when it was first discovered by Europeans, an almost unbroken forest spread over and around the Appalachian system of mountains, reaching to the Atlantic Ocean, Gulf of Mexico, far beyond the St. Laurence river, and westward beyond the Mississippi. The spots which have been cleared in this ocean of trees are very insignificant when compared with its vast extent, which has been estimated at 2,000,000 of square miles. The most valuable trees are several species of oak, pine, and hickory, and three or four species of maple, one of which, the sugar maple, is extremely valuable. The lirioidendron, a kind of magnolia, flourishes in such luxuriance of growth, as to be called the pride of the western forests. The great Weymouth pine is one of the most beautiful of the North American forest trees, attaining its greatest magnitude and perfection in the more northern regions. Its trunk is often of the diameter of five or six feet, rising smooth and straight from 60 to 80 feet, and terminated by a dense conical top. It forms a striking feature in the forest scenery of Vermont, New Hampshire, New York, and some parts of Canada; rising by nearly half its elevation above the summits of the other trees, and resembling, like the palms of the tropics, a forest planted upon another forest. Descending from the Alleghanies into the valley of the Ohio, we find near the summit of Laurel Ridge a change in the aspect of the forest. The deep hue of the hemlock spruce, the Weymouth pine, and other trees of the family of conifers, is exchanged for the livelier verdure of the broad-leaved laurel, the rhododendron, and magnolia. (*Darby's View of the United States*; various Memoirs in *Silliman's Journal of Science*; Maclure's *Geology of the United States*.)

APPALACHICOLA, a river of the United States, which rises in the state of Georgia, and flows into the Gulf of Mexico. The Appalachicola consists of two main branches, the Chatahooche and Flint river; and the Chatahooche itself consists of two main branches, the Chestatee and Chatahooche proper. The Chestatee rises in the northern extremity of Habersham county, in the state of Georgia (35° N. lat.), and in the high table-land of the Appalachian system, at an elevation of about 2000 feet. Its sources are near

those of the Savannah, which flows into the Atlantic, the Coosa, which is an affluent of the Alabama river (see ALABAMA), and the Tennessee, one of the great affluents of the Mississippi. The Chatahochee, after a course of 100 miles, for the most part S.S.W., receives, near the parallel of 34° and from the N.E., the Upper Chatahochee, whose course to the point of junction is shorter than that of the Chatahochee.

At their junction, the river takes the name of Chatahochee, and pursues a general southern course for 250 miles, to about $30^{\circ} 40'$ N. lat., where it is joined on the east by the Flint River. This river system presents several peculiarities. The general course of the Chatahochee proper, and that of the united streams for a short distance below the point of junction, is about S.W. Following the course of the Chatahochee proper downwards, at a short distance from its channel and to the east we find some of the higher affluents of the Savannah and all the head waters of the Alatomaha; these two rivers flow into the Atlantic. Thus it appears that a very narrow belt of high land divides the channel of the Chatahochee proper from the sources of the Atlantic streams just mentioned. From the junction of the Chatahochee and Chatahochee to the junction of the Flint River, no stream larger than an inconsiderable creek joins the Chatahochee, which has a long and very narrow basin, estimated at about 320 miles in length, with a mean breadth of 35 miles, and an area of 11,200 square miles.

The Flint River rises in Georgia ($33^{\circ} 30'$ N. lat.), and as its upper waters have a direction exactly similar to those of the upper waters of the Alatomaha, it appears, for about a third part of its course, doubtful whether its waters will enter the Gulf of Florida or the Atlantic. Its general direction is S., and then S.W. to its junction with the Chatahochee; its course is estimated at about 210 miles, and its basin is narrow, not exceeding 40 miles of average breadth.

The united streams of the Chatahochee and Flint take the name of Appalachicola, and run S. 70 miles, dividing into several channels and forming a delta. The outlets of this stream are in St. George's Sound, in the Gulf of Mexico, in $29^{\circ} 46'$ N. lat. The direction of this river is singularly straight, having a general southern course of above 400 miles; it runs through more than five and a half degrees of latitude; and as the elevation of the highest parts of the river is 2000 feet, we have, as we advance from the mouth to the source, all the variations of temperature that can arise from the combined effect of variation of latitude and elevation of surface.

The Appalachicola is navigable for vessels up to the junction of the two great branches, and the Chatahochee is navigable for boats almost to its source. The bed of the river is said to be deep and capacious: the tides ascend about two-thirds of the distance between the sea and the junction of the Flint and Chatahochee. (Darby's *Geographical View of the United States*.)

APPARATUS SCULPTORIS, or the Sculptor's Workshop, a constellation formed by LACAILLE. It is situated in that region of the heavens immediately to the eastward of the large star Fomalhaut or α Piscis Australis, and hardly rises above the horizon in our hemisphere. It is bounded by Cetus and Aquarius on the north, Fornax Chemica on the east, Piscis Australis on the west, and Phoenix on the south. Its principal stars are designated as follows:

Character.	No. in Catalogue of		Magnitude.
	Piazzi.	Astron. Society.	
κ^2	6	12	5.6
γ	36	2779	5
ι	50	24	6
	99	165	6
ϵ	168	191	5
δ	192	2944	5
α	250	100	5
κ^1	285	4	6

APPA'RENT (in astronomy). When it is necessary or convenient to reduce an observed phenomenon, either by clearing it of the effects of any optical delusion, or substituting for it the phenomenon which would have been observed at some more commodious station, that which is actually observed is called the *apparent* phenomenon, in opposition to that which results from correction or reduction, which is

called the *real* or *true* phenomenon. Without discussing the propriety of these names, we shall give a few instances of their use. The apparent altitude of a star requires a correction for REFRACTION, an optical delusion which makes the star appear a little higher than it would do if there were no atmosphere. The observed (*apparent*) place of a planet is always reduced to that in which it would be seen from the centre of the earth, which is called its true place [see PARALLAX]. The same correction is required to reduce the *apparent* phenomena of an eclipse to the *true*. The *apparent* or *sensible* horizon is the plane in which lies the circle actually bounding the view; the *real* or *rational* horizon is a plane parallel to the preceding, drawn through the centre of the earth. These will be sufficient exemplifications of the use of the word; which, it must be observed, is arbitrary, and, in some cases, inconsistent. For example, the *apparent* diameter of a planet is the angle made by two lines drawn to the eye from opposite points of its disk; while the *true* diameter is a magnitude of a different kind, namely, the line which joins the points of the disk aforesaid. Nevertheless, the preceding *apparent* diameter of the moon, reduced to the centre of the earth, would be called the true diameter by astronomers, from which some confusion might arise, were it not that the linear diameter very seldom enters into the computation.

APPARENT MAGNITUDE. The angle under which any line appears at the eye, that is, the angle made by lines drawn from its extremities to the eye. [See MAGNITUDE.]

APPARENT MOTION. The velocity and deception in which a body appears to move, when the spectator himself is in motion, without being conscious of it. For further detail see MOTION.

APPARITION. The mind affects the body: the body affects the mind, and some insight may be obtained into the disordered states of the mind, by considering the physical conditions which are necessary to sound thought.

It is not true, as is commonly supposed, that we see with the eye, and hear with the ear, and taste with the tongue. The true seat of these sensations is the brain, and the eye, the ear, the tongue, are organs adapted to receive impressions from external objects, which impressions are transmitted from the organs by an appropriate apparatus to the brain, where they become sensations. When an object is presented to an organ of sense, it produces a change in the nerves of that organ. This change is conveyed by the nerves to the brain: a corresponding change is occasioned in the brain, and through the brain in the mind; and it is this change in the mind which is expressed by the term sensation. Ideas on the contrary are copies of sensations, renovations of prior feelings, in general differing from sensations in being less intense.

The functions of the brain, then, are sensation, and, the analogous term be allowed, ideation, together with the action and re-action of these two states on each other, known under the name of intellectual operation. The main instrument by which intellectual operation is carried what is termed association. It is a property of the mind to combine and unite the sensations and ideas it receives in such a manner, that, after this combination or union has been once formed, if any one of these sensations and ideas be revived, the single sensation or idea so revived will immediately call up to view all the sensations and ideas that had previously been connected with it; and this power of association, as long as its action is sound, is observed to operate in a uniform and determinate manner. For example, when sound, association excites ideas in a certain order, generally in the order of sensation. Thus, if the sensations A B C were impressed upon the mind in the order of these letters, B will re-excite not A, but C. Association, when sound, operates by exciting ideas with a certain degree of velocity. If the rapidity of the succession of the trains of ideas pass beyond a certain point, instead of distinct, there is confused thought. Association, when sound, operates by exciting ideas with a certain degree of vivacity. Sensation is not produced, unless the external object be applied to the organ of sense with a certain degree of force; while, if propelled against it with too great an impetus, instead of specific sensation, it excites only pain. In like manner, unless the trains of ideas recalled by association possess a certain degree of vivacity, they present to the mind an indistinct assemblage of images: if, on the other hand, they are too vivid, they are equally incapable of forming the elements of sound thought.

In order that the brain may carry on these operations, that is, in order that it may receive the impressions conveyed to it by the nerves from the organs of sense, in order that it may convert these impressions into sensations, and in order that it may duly combine and revive them, it must be in a sound state. The chief agents which maintain the brain in a sound state are its organic nerves, and its circulating vessels. Like every other organ, the brain is maintained in a healthy condition by the organic process of nutrition, over which the system of nerves termed organic [see NERVE] preside. If these organic nerves become disordered disease may take place in the substance of the brain, and this disease may assume a variety of forms far too great to be enumerated here, the slightest of which may be incompatible with the production of sound thought. If, on the other hand, the flow of blood through its circulating vessels be deranged, the process of thought may be equally disordered. Stop the flow of blood to the brain altogether, insensibility will follow instantly; fainting will supervene, and this state will be quickly succeeded by death, unless the vital current be re-admitted. Quickened the circulation beyond a certain point, insensibility equally follows; and, though the preternatural velocity of the circulation should stop short of inducing insensibility, it may yet disturb the ordinary process of thought in an infinite variety of modes.

Now there is scarcely a single disease which is not capable of disturbing, in a greater or less degree, the action of the organic nerves of the brain; but the maladies which most commonly and remarkably disturb the functions of these nerves are certain diseases of the abdominal viscera, particularly of the alimentary canal, and more especially of that portion of it which forms the stomach; certain diseases of the liver, and of the mesenteric glands, and of the urinary and reproductive organs. In like manner excitation or depression of the action of the blood vessels of the brain, beyond a certain point, uniformly disorders sensation and all the mental operations. Striking illustrations of both are afforded by the effect of many physical agents, as well as of natural diseases. Of the first, the effects of the inhalation of nitrous oxide affords an example. When nitrous oxide is received into the lungs, the pulse is increased in strength, fulness, and velocity. A corresponding change takes place in the mental impressions. Sensation becomes more vivid; the sensibility to touch increases; luminous points dazzle the eye; the hearing is more acute; recollections, generally of a pleasing nature, and of uncommon intensity, pass rapidly through the mind. One individual compares his feelings, under the influence of this gas, to those which he experiences when witnessing an heroic scene upon the stage; another likens them to the emotions he felt when, on the occasion of the commemoration held at Westminster Abbey in honour of Handel, he heard seven hundred instruments playing at one time.

After my return from a long journey,' says Sir Humphry Davy, 'being fatigued, I respired nine quarts of nitrous oxide, having been thirty-three days without breathing any. After the first six or seven respirations I gradually began to lose the perception of external things, and a vivid and intense recollection of some former experiments passed through my mind, so that I called out "What an amazing concatenation of ideas!"' On another occasion, after having been enclosed in an air-tight breathing box, of the capacity of nine cubic feet and a half, in which he became habituated to the excitement of the gas, which was there carried on gradually, and after having been in this place of confinement an hour and a quarter, during which time no less a quantity than eighty quarts were thrown in, this experimentalist says, 'The moment after I came out of the box I began to respire twenty quarts of unmingled nitrous oxide. A thrilling, extending from the chest to the extremities, was almost immediately produced. I felt a sense of tangible extension, highly pleasurable, in every limb; my visible impressions dazzling, and apparently magnified. I heard distinctly every sound in the room, and was perfectly aware of my situation. By degrees, as the pleasurable sensation increased, I lost all connexion with external things; trains of vivid, visible images rapidly passed through my mind, and were connected with words in such a manner as to produce sensations perfectly novel. I existed in a world of newly-connected and newly-modified ideas. When I was awakened from this semi-delirious trance by Dr. Kinglake, who took the bag from my mouth, indignation and pride were the first feelings produced by the sight of the persons

about me. My emotions were enthusiastic and sublime; and for a moment I walked round the room perfectly regardless of what was said to me. As I recovered my former state of mind, I felt an inclination to communicate the discoveries I had made during the experiment. I endeavoured to recall the ideas—they were feeble and indistinct. One reflection of terrors, however, presented itself, and with the most intense belief and prophetic manner, I exclaimed to Dr. Kinglake, "Nothing exists but thoughts; the universe is composed of impressions, ideas, pleasures, and pains!"'

From this interesting experiment, it appears that in consequence of an extraordinary impression upon the brain, through the medium of the nerves and the circulating vessels, 1. sensations were increased in intensity; 2. ideas were increased in vividness; 3. in consequence of this change in the ordinary state of sensation and ideation, all connexion with external things was lost—a world of newly connected and newly-modified ideas arose; 4. emotions were produced corresponding in intensity to the acuteness of sensation and the vividness of ideas. 'My emotions were enthusiastic and sublime. I exclaimed, "Nothing exists but thoughts; the universe is composed of impressions, ideas, pleasures, and pains!"'

The inhalation of malaria, the poison which produces fever, affords an equally striking illustration of the modification of sensation, and of all the subsequent operations of the mind, by a cause affecting the nerves and blood-vessels of the brain. Febrile miasma is a depressing, nitrous oxide a stimulating, agent; the effect of the former on the brain ought therefore to be the reverse of the latter, and, accordingly, on receiving into the lungs the febrile miasma, the pulse becomes oppressed and weak; languor and lassitude pervade the limbs; the countenance becomes pale, the surface cold; headache, giddiness, and sometimes vomiting supervene, while the mind is feeble, dull, dejected, incapable of the effort of attention, and utterly unable to control or even to connect the trains of gloomy and distressing images which terrify the imagination. 'Some circumstances had occurred,' says a physician who carefully observed the phenomena which attended the progressive derangement of his own mind under the influence of fever, 'to render me anxious and dispirited; of these I took an exaggerated and gloomy view. I had been studying during several months with unusual severity. One day in the cold weather of January, after having been occupied many hours in the practical duties of my profession, I returned home fatigued. Great as was my bodily exhaustion, the depression of my mind was still more remarkable. My head ached, and unable to study or to attend to any professional engagement, I lay on the sofa and attempted to read, chance having thrown in my way the American novel called the *Water Witch*. I became interested in the story, but the pain and confusion of my head increasing, I requested a friend to read to me, my own eye continually wandering from the page. The progress of the fever was rapid; its chief force fell upon the organ that had been recently over excited, the brain; and delirium came on early, and somewhat suddenly. Immediately before I became decidedly delirious, I received an invitation to the soirées given by the Duke of Sussex to the members of the Royal Society. The friend I asked to return an answer expressive of my regret that I should be unable to attend on account of illness, used, as I conceived, an expression not strictly correct: this verbal inaccuracy, I thought, was construed into wilful falsehood: the matter was brought before this assemblage of learned men, who unanimously declared that it ought to exclude me from the society of honourable men, and that I should no more be admitted amongst them. This announcement was brought me from the palace, accompanied with martial music, but of a more solemn and impressive kind than I had ever heard before, in which was predominant the sound of bells, soft, and as if of silver tone. Remonstrance was vain: the decision, of which I succeeded in obtaining a reconsideration, was confirmed; this confirmation was brought me in the same manner as the first announcement, accompanied with the same kind of music, only still more solemn and impressive. I saw no person forming the band of musicians, but occasionally I heard very distinctly their measured step. I now thought myself an abandoned and lost being; and the apprehension that every one about me hated and sought occasion to destroy me, took possession of my mind. My physicians, my nurses, my dearest friends, were in league

with a malignant spirit, which assumed the shape of the demon of the *Water Witch*. By an object of my tender affection, who was anxiously watching over me, but in whom I now saw only the willing agent of the demon, I was betrayed, and through this treachery the malignant spirit obtained entire possession of me. No sooner was I in the power of the demon than she began to suggest to me the commission of crimes abhorrent to my nature, and at last there fixed upon my mind the impression that I had really been guilty of the crimes, by the vivid picture of which my imagination had been disturbed. I pass over the hurricanes and storms I encountered, evidently suggested by the descriptions in the novel I had just been reading; on the sudden subsidence of these I thought I stood before an invisible tribunal. I felt a solemn consciousness that an all-seeing eye was on me; while there was visible to me only a portion of the deck of the *Water Witch*, and very obscurely the shadow of my malignant accuser. Not the crimes falsely laid to my charge, but the actual events of my life, even the events of childhood and youth, long forgotten, were now called up before me with extraordinary vividness; all the circumstances of place, person, dress, language, and attitude, such as had actually accompanied them, being revived. Of each of these events I was compelled to give a true account, an invisible hand recording every syllable that fell from my lips, and a secret power obliging me to utter the words which expressed the exact truth. During this ordeal I saw the countenances of dear friends, and of secret and open enemies, those that had long been dead, as well as those that were still living; the former cheering me by their attitudes and words, the latter scowling upon me and assuming menacing postures, but uttering no sound. And now again I felt myself under the power of the demon, by whose uncontrollable agency I was compelled to accuse myself of the crimes of her own suggesting; and while suffering the bitter anguish of self-reproach, and expecting some fearful punishment, I again saw my dearest friends, with their innocent and happy countenances, engaged in occupations with which associations of a highly pleasurable nature had been formed in my mind, but whom I could not make sensible of my presence, and with whom I was doomed to hold affectionate intercourse no more. After this I have no remembrance of anything that passed, until conscious of the return of some obscure and vague recollections. I had the impression that some calamity had befallen me; but I felt as if a soft and refreshing breeze were blowing gently upon me; and soon I found myself in a vast ocean, in a beautifully-constructed vessel, with a fresh and invigorating breeze, sailing rapidly along a coast presenting the most magnificent and lovely scenery; and at length the vessel entered gallantly a port unknown to me, but the strand was crowded with human beings with happy faces, and still happier voices. I had returned from a long voyage, but I could not make out where I had been. I felt hungry and fatigued; and now, for the first time, I recognized the individuals of my family, after having been violently delirious upwards of a fortnight, during the last three days of which time I lay in a state of total insensibility, my physicians and friends expecting every moment to be the last.

Whoever will consider carefully the mental phenomena produced by the different and opposite conditions of the brain in these two instructive cases, the one produced by the operation of a physical agent, the other arising under the influence of disease, will have no difficulty in conceiving the origin of spectral illusions, either with the consciousness that they are illusions, or with a temporary or permanent persuasion that they are real existences, and whether arising from external or internal causes, or from both combined.

The case of Nicolai, the celebrated bookseller of Berlin, affords a curious illustration of the long continuance of vivid spectral illusions, without the slightest belief of the real existence of the apparitions. 'In a state of mind completely sound, and after the first terror was over, with perfect calmness,' says this remarkable man, 'I saw, for nearly two months, almost constantly and involuntarily, a vast number of human and other forms, and even heard their voices.'

'My wife and another person came into my apartment in the morning, in order to console me, but I was too much agitated by a series of incidents, which had most powerfully affected my moral feeling, to be capable of attending to them. On a sudden, I perceived, at about the distance of ten steps, a form like that of a deceased person.

I pointed at it, asking my wife if she did not see it? It was but natural that she should not see anything: my question, therefore, alarmed her very much, and she immediately sent for a physician. The phantom continued about eight minutes. I grew at length more calm, and being extremely exhausted, fell into a restless sleep, which lasted about half an hour. The physician ascribed the apparition to a violent mental emotion, and hoped there would be no return: but the violent agitation of my mind had in some way disordered my nerves, and produced further consequences which deserve a minute description.

'At four in the afternoon, the form which I had seen in the morning, re-appeared. I was by myself when this happened, and being rather uneasy at the incident, went to my wife's apartment, but there likewise I was persecuted by the apparition, which, however, at intervals disappeared, and always presented itself in a standing posture. About six o'clock there appeared also several walking figures, which had no connexion with the first. After the first day, the form of the deceased person no more appeared, but its place was supplied with many other phantasms, sometimes representing acquaintances, but mostly strangers: those whom I knew were composed of living and deceased persons, but the number of the latter was comparatively small. I observed the persons with whom I daily conversed did not appear as phantasms, these representing chiefly persons who lived at some distance from me.

'These phantasms seemed equally clear and distinct at all times, and under all circumstances, both when I was by myself, and when I was in company, and as well in the day as at night, and in my own house as well as abroad: they were, however, less frequent when I was in the house of a friend, and rarely appeared to me in the street. When I shut my eyes, these phantasms would sometimes vanish entirely, though there were instances when I beheld them with my eyes closed; yet, when they disappeared on such occasions, they generally returned when I opened my eyes. I conversed sometimes with my physician and my wife of the phantasms which at the moment surrounded me: they appeared more frequently walking than at rest, nor were they constantly present. They frequently did not come for some time, but always re-appeared for a longer or a shorter period, either singly or in company: the latter, however, being most frequently the case. I generally saw human forms of both sexes, but they usually seemed not to take the smallest notice of each other, moving as in a market-place, where all are eager to press through the crowd; at times, however, they seemed to be transacting business with each other. I also several times saw people on horseback, dogs, and birds. All these phantasms appeared to me in their natural size, and as distinct as if alive, exhibiting different shades of carnation in the uncovered parts, as well as different colours and fashions in their dresses, though the colours seemed somewhat paler than in real nature. None of the figures appeared particularly terrible, comical, or disgusting, most of them being of an indolent shape, and some presenting a pleasing aspect.

'The longer these phantasms continued to visit me, the more frequently did they return: while at the same time they increased in number about four weeks after they had first appeared. I also began to hear them talk: these phantasms sometimes conversed among themselves, but more frequently addressed their discourse to me: their speeches were commonly short, and never of an unpleasant turn. At different times there appeared to me both dear and sensible friends of both sexes, whose addresses tended to appease my grief, which had not yet wholly subsided: their consolatory speeches were in general addressed to me when I was alone. Sometimes, however, I was accosted by these consoling friends while I was engaged in company, and not unfrequently while real persons were speaking to me.'

Of the natural constitution of his mind, Nicolai states, 'My imagination possesses in general a *great facility in picturing*. I have, for example, sketched in my mind a number of plans for novels and plays, though I have committed very few of them to paper, because I was less solicitous to execute than to invent. I have generally arranged these outlines when in a cheerful state of mind I have taken a solitary walk, or when travelling I have sat in my carriage, and could only find employment in myself and my imagination. Constantly, and even now, do the different persons whom I imagine in the foundation of such a plot *present themselves to me in the most lively and distinct man-*

ner, their figure, their features, their manner, their dress, and their complexion, are all visible to my fancy. As long as I meditate on a fixed plan, and afterwards carry it into effect, even when I am interrupted and when I must begin it again at different times, all the acting persons *continue present in the very same form* in which my imagination at first produced them. I find myself frequently in a state between sleeping and waking, in which a number of pictures of every description, often of the strangest forms, show themselves, change, and vanish. In the year 1778, I was afflicted with a bilious fever, which at times, though seldom, became so high as to produce delirium. Every day, towards evening, the fever came on, and if I happened to shut my eyes at that time, I could perceive that the cold fit of the fever was beginning, even before the sensation of cold was observable. This I knew by the distinct appearance of coloured pictures, of less than half their natural size, which looked as in frames. They were a set of landscapes, composed of trees, rocks, and other objects. If I kept my eyes shut, every minute some alteration took place in the representation. Some figures vanished and others appeared. But if I opened my eyes, all was gone; if I shut them again, I had a different landscape. In the cold fit of the fever, I sometimes opened and shut my eyes every second, for the purpose of observation, and every time a different picture appeared, replete with various objects, which had not the least resemblance to those that appeared before. These pictures presented themselves without interruption as long as the cold fit of the fever lasted. They became fainter as soon as I began to grow warm; and when I was perfectly so, all were gone. When the cold fit of the fever was entirely past, no more pictures appeared; but if on the next day I could again see pictures when my eyes were shut, it was a certain sign that the cold fit was coming on.

This is a remarkable instance of spectral illusion manifestly arising from a physical cause, in a person of a philosophical turn of mind, able to refer the illusions to their real source, and therefore to maintain his consciousness of their true nature. It was otherwise with John Beaumont, the author of a *Treatise on Spirits and Apparitions*, who was a man of hypochondriacal disposition, and who, while labouring under this bodily disease, saw hundreds of imaginary men and women about him, and in whose real existence he came to be a firm believer. Among the spirits that visited him, there were two who became his constant attendants, and who called each other by their names: several spirits would often call at his chamber, and ask whether such spirits lived there, calling them by their names, and they would answer, they did. One spirit, which came for several nights together, and rung a little bell in his ear, told him that his name was Ariel. The two spirits that constantly attended him were ladies of a brown complexion, about three feet in stature; they had both black loose net-work gowns, tied with a black sash about the middle; and within the net-work appeared a gown of a golden colour, with somewhat of a light striking through it. 'These women told me they would kill me if I told any person in the house of their being there, which put me in some consternation, and I made a servant sit up with me four nights in my chamber, before a fire, it being in the Christmas holidays; telling no person of their being there. One of these spirits, in woman's dress, lay down upon the bed by me every night; and told me, if I slept, the spirits would kill me, which kept me waking for three nights. In the mean time, a near relation of mine went (though unknown to me) to a physician, of my acquaintance, desiring him to prescribe me somewhat for sleeping, which he did, and a sleeping potion was brought me, but I set it by, being very desirous and inclined to sleep without it. The fourth night, I could hardly forbear sleeping, but the spirit, lying on the bed by me, told me again, I should be killed if I slept: whereupon I rose, and sat by the fire-side, and in a while returned to my bed; and so I did a third time, but was still threatened as before; whereupon, I grew impatient, and asked the spirits, what they would have?—told them I had done the part of a Christian, in humbling myself to God, and feared them not; and rose from my bed, took a cane, and knocked at the ceiling of my chamber: a near relation of mine, lying then over me, who presently rose and came down to me, about two o'clock in the morning: to whom I said, you have seen me disturbed these four days past, and that I have not slept—the occasion of it was, that five spirits, which are now in the room with me, have threatened to kill me if I told any person of

their being here, or if I slept; but I am not able to forbear sleeping longer, and acquaint you with it, and now stand in defiance of them: and thus I exerted myself about them; and, notwithstanding their continued threats, I slept very well the next night, and continued so to do, though they continued with me above three months, day and night.'

We have seen that some minds have a strong natural tendency to form vivid pictorial images of every thing that interests them; in others, there is a like tendency to the intense renovation of past impressions. 'I remember,' says Dr. Ferriar, 'that, about the age of fourteen, if ever I had been viewing any interesting object in the course of the day, such as a romantic ruin, a fine seat, or a review of a body of troops, as soon as evening came on, if I had occasion to go into a dark room, the whole scene was brought before my eyes with a brilliancy equal to what it had possessed in daylight, and remained visible for several minutes. I have no doubt that dismal and frightful images have been often presented to the mind in the same manner after scenes of domestic affliction or public horror.' Certain states of the body, and certain affections of the mind, powerfully predispose to the intense renovation of past impressions, however those impressions have been induced, and whatever their nature, the immediate exciting cause of the renovation being often some external object acting upon the senses or upon the imagination under circumstances favourable to the illusion. A large class of spectral illusions are referable to this head, of which the following may be taken as an example. A gentleman was benighted, while travelling alone, in a remote part of the highlands of Scotland, and was compelled to ask shelter for the evening at a small lonely hut. When he was to be conducted to his bed-room, the landlady observed, with mysterious reluctance, that he would find the window very insecure. On examination, part of the wall appeared to have been broken down to enlarge the opening. After some inquiry, he was told that a pedlar, who had lodged in the room a short time before, had committed suicide, and was found hanging behind the door in the morning. According to the superstition of the country, it was deemed improper to remove the body through the door of the house: and to convey it through the window was impossible, without removing part of the wall. Some hints were dropped that the room had been subsequently haunted by the poor man's spirit. My friend laid his arms, properly prepared against intrusion of any kind, by the bed-side and retired to rest, not without some degree of apprehension. He was visited in a dream by a frightful apparition, and, awaking in agony, found himself sitting up in bed, with a pistol grasped in his right hand. On casting a fearful glance round the room, he discovered by the moonlight a corpse dressed in a shroud, reared erect against the wall close by the window. With much difficulty he summoned up resolution to approach the dismal object, the features of which, and the minutest parts of its funeral apparel, he perceived distinctly. He passed one hand over it, felt nothing, and staggered back to bed. After a long interval, and much reasoning with himself, he renewed his investigation, and at length discovered that the object of his terror was produced by the moonbeams, forming a long, bright image, through the broken window, on which his fancy impressed by his dream, had pictured, with mischievous accuracy, the lineaments of a body prepared for interment. Powerful associations of terror, in this instance, had excited the recollected images with uncommon force and effect.

The peculiarity of constitution expressed by the term predisposition, whether corporeal or mental, is not only deeply implicated in the production of a general tendency to the formation of these phantoms, but it often determines even the specific character which each assumes. Since the predisposition varies in each individual, the same morbid cause may conjure up images the most diversified. The inhalation of nitrous oxide commonly excites vivid images of a pleasing nature, accompanied with grateful sensations; but in some cases it presents to the imagination frightful pictures, and produces on the system painful effects; and, for the same reason, the morbid cause, whatever it be, which gives rise to spectral illusions, may in one excite soothing and delightful visions, and in another hideous and appalling spectres. The daughter of Sir Charles Lee 'saw, about two of the clock in the morning, the apparition of a little woman between her curtain and her pillow, who told her she was her (deceased) mother; that she was happy, and by twelve of the clock that day she should be with her

Whereupon she knocked up her maid, called for her clothes, and when she was dressed she went into her closet, and came not out again till nine, and then brought with her a letter, sealed, to her father; brought it to her aunt, the Lady Everard, told her what had happened, and desired, that as soon as she was dead it might be sent to him. She desired that the chaplain might be called to read prayers; and when prayers were ended, she took her guitar and psalm-book, and sat down upon a chair without arms, and played and sang so melodiously and admirably, that her music-master, who was then there, admired at it. And near the stroke of twelve, she rose and sat herself down in a great chair with arms, and fetching a strong breathing or two, immediately expired. In this case, a spectral illusion occurring in a tender and susceptible frame, produced such a powerful impression upon the imagination, as absolutely to destroy life. The contrast to this is the case of the sturdy assessor to the Westminster Assembly, who received a visit from the arch-fiend himself, and whom he treated with a cool contempt, which must have astonished his Satanic majesty. 'The devil, in a light night, stood by his bedside. The assessor looked awhile, whether he would say or do anything; and then said, "If thou hast nothing to do, I have;" and so turned himself to sleep.'

There are many cases on record which directly prove that there is often the closest possible connexion between the very shape which these phantasms assume and the images which have previously occupied the mind. A writer in the fifteenth volume of Nicholson's Philosophical Journal, who was haunted with the apparition of frightful spectres, and who was at length struck with some connexion between these images and his previous thoughts, states, that he tried the experiment, whether, by fixing his meditation upon other objects, he could not make these assume the place of the phantasms which persecuted him; that with this view, while the faces were flashing before him, he reflected upon landscapes and scenes of architectural grandeur; that accordingly, after a considerable interval of time, a rural scene of hills, valleys, and fields appeared before him, which was succeeded by another and another, in ceaseless succession; that the manner and times of their respective appearance, duration, and vanishing, did not sensibly differ from those of the faces; that the scenes were calm and still, without any strong lights or glare; that, after a time, these figures changed entirely, and consisted of books, parchments, or papers, containing printed matter. The writer adds, 'I was now so well aware of the connexion of thought with these appearances, that, by fixing my mind on the consideration of manuscript instead of printed type, the papers appeared, after a time, only with manuscript writing, and afterwards, by the same process, instead of being erect, they were all inverted or appeared upside down. The intelligent and philosophical Nicolai saw nothing but men and women, in their natural form and aspect, horses, dogs, and birds: the illusions of superstitious minds consist of angels or devils, which assume all sorts of fantastic shapes. Remigius, who was a commissioner for the trial of witches in Lorrain, and who boasts that, in the course of fifteen years, he had condemned nine hundred criminals to the stake, paid particular attention to the form, features, and dress of demons: yet his statements clearly show that they did not vary from the gross sculptures and paintings of the middle ages, and that recollected images only were present to the persons labouring under the delusions for which they suffered death. They are said to be black faced, with sunk but fiery eyes; their mouths wide, and smelling of sulphur; their hands hairy, with claws; their feet horny and cloven. 'A devil would appear like an angel, seated in a fiery chariot; or riding on an infernal dragon, and carrying in his right hand a viper; or assuming a lion's head, a goose's feet, and a horse's tail; or putting on a raven's head, and mounted on a strong wolf; with innumerable other fantastic shapes of a similar description. These mysterious and frightful images were not only made familiar to the imaginations of the people, but even to their very senses. They could go neither into their dwellings nor their temples without seeing them; they were sculptured on the walls of the church, they were carved on the wainscots of the domestic hall, and the air and the earth were peopled with them; there was not a hill nor a valley, not a wood nor a grove, not a fountain nor a stream, in which they were not seen and heard, and communed with. No place was void,' says Burton, 'but all full of spirits, devils, or other inhabit-

ants; not so much as a hair breadth was empty in heaven, earth, or water above or under the earth.' 'Our mothers' maids,' observes Reginald Scot, 'have so terrified us with an ugly devil, having horns on his head, fier in his mouth, and a tail in his breach, eies like a bacon, fangs like a dog, claws like a beare, a skin like a niger, and a voice roaring like a lion, that we start and are afraid when we hear any one cry *haugh!*'

What wonder that these hideous phantoms should make an indelible impression on weak and ignorant minds, and exert an influence even over strong and cultivated understandings, which their better reason could not at all times resist! What wonder when, from corporal disease, sensations and ideas were rendered preternaturally intense, or the vivacity of ideas was so increased as to overpower actual impressions, that these spectres should be seen in solitude, and heard in the storm; should dance before the eye, and whisper in the ear; should assume a menacing aspect in the dreams of the guilty, and come with the cherub's smile in the visions of the innocent; should be to the maniac all that existed, and to the feverish and dying what most they hoped or feared!

In regard to ghosts, it is observable that they were remarkably abundant in this country during the interregnum after the civil war in 1649. 'The melancholic tendency of the rigid puritans of that period; their occupancy of old family seats, formerly the residence of hospitality and good cheer, which in their hands became desolate and gloomy; and the dismal stories propagated by the discarded retainers to the ancient establishments, ecclesiastical and civil, contributed altogether to produce a national horror unknown in other periods of our history.' It is well known that ghosts commonly appear in the same dress they wore when living; sometimes, indeed, they are clothed all in white, but these are chiefly the 'churchyard ghosts, who have no particular business, but seem to appear *pro bono publico*, or to scare drunken rustics from tumbling over their graves. Dragging chains is not the fashion of English ghosts, chains and black vestments being chiefly the accoutrements of foreign spectres, seen in arbitrary governments,—dead or alive English spirits are free.' Ghosts are commonly pale, and often assume a misty or cloudy appearance, the spectral idea of colour not quite equalling in intensity the vividness of an immediate sensation. The phantoms seen by Nicolai were always of a paler colour than real beings; and when they began to diminish and disappear, their colour became fainter and fainter, until at last they appeared entirely white.

We cannot dismiss the subject of apparitions without observing, that the manner in which these phantoms have vanished before the light of knowledge affords a striking illustration of the blessings which descend even to the lowest of the people from the diffusion of the sound principles of philosophy. The powerful and capricious spirits which filled 'the heavens, the earth, and the waters above and under the earth,' added, in no inconsiderable measure, to the sum of human suffering. They were, in general, hideous in form, and malignant in intention; the number of the good small, that of the evil countless; and though of 'soft and uncompounded essence,' they might have come in what shape they chose, 'diluted or condensed, bright or obscure,' yet they did assume 'forms forbidden,' such as 'retire to chaos, and with night commix;' and their visitations were much more often accompanied with 'blasts from hell' than 'airs from heaven.' They produced powerful emotion, for the most part painful and of pernicious tendency. They afforded materials for the fiction of the poet, and the pencil of the painter; but the imagery of the one, and the figures of the other, were distinguished for incongruity and deformity, not for beauty and grace. Haunting the couch of sickness, in minds debilitated by disease, they often chased reason from its throne, and sometimes deprived the sufferer of life. The ignorant they terrified with false fears, and they afforded no compensation in the uniformity and efficacy with which they visited the guilty with remorse. As agents in the administration of reward and punishment they were most unjust. If they brought down vengeance on the criminal, it was not for the commission of crime, but the neglect of punctilios; and if, as guardian angels, they hovered about the pillow of the dying, they were not messengers of evil to the wicked, and ministers of grace to the good; but this 'blessed troop, with faces bright like the sun, bearing garlands, and promising eternal happiness,' was as disposed to waft to heaven the soul of the sinner as of the saint. By

preoccupying the mind, they took off the attention from the observation of nature, and deprived it both of the power and of the disposition to discover the true solution of those physical, mental, and moral phenomena which could not wholly escape notice, and in this lies the real malignity of their influence. They incapacitated the mind for the perception of truth, disposed it for the reception of the grossest delusions of credulity, and prepared it for the admission of the most fallacious account of the sources of calamity and suffering. In the hands of the priest and the tyrant, they were potent to delude and enslave; and they did their work faithfully. The human mind will anticipate the future, and must reflect upon the past. In the former, there will always be sufficient to fear, and in the latter, enough to regret, without the stimulus of fictitious terror, or the imputation of imaginary guilt. As long as the human frame can suffer, and is subject to death, the mind will require whatever light philosophy can pour upon it, to preserve it from error, and whatever consolation religion can afford, to save it, at least, from misery, if not from despair. In philosophy, there is light, and in religion, consolation; and he is a friend to man who labours to secure to him these inestimable blessings, free from the admixture of ignorance and the alloy of superstition. See article Apparitions, *Westminster Review*, No. II., of which large use has here been made by the author of that article with the permission of the proprietors. See also *An Essay towards a Theory of Apparitions*, by John Ferriar, M.D., 1813; and *Sketches of the Philosophy of Apparitions, or an Attempt to trace such Illusions to their Physical Causes*, by Samuel Hibbert, M.D., 1821.

APPEAL. The removal of a cause from an inferior court or judge to a superior one, for the purpose of examining the validity of the judgment given by such inferior court or judge, is called an appeal.

An appeal from the decision of a court of common law is usually prosecuted by suing out a *writ of error*, by means of which the judgment of the court below undergoes discussion, and is either affirmed or reversed in the court of error. The proceedings in such cases will be found under the title *Error*.

The term appeal, used in the above sense, is by the law of England applied in strictness chiefly to certain proceedings in Parliament, in the Privy Council, in the Courts of Equity, in the Admiralty and Ecclesiastical courts, and in the Court of Quarter Sessions.

Thus, an appeal lies to the House of Lords from the decree of the Court of Chancery in this country, and in Ireland; from the Equity side of the Court of Exchequer; and from the decision of the supreme courts in Scotland.

An appeal lies to the king in council from the decrees and decisions of the colonial courts, and indeed from all judicatures within the dominions of the crown, except Great Britain and Ireland.

To the same jurisdiction are referred (in the last resort) all ecclesiastical and admiralty causes, and all matters of lunacy and idiocy.

A decision of the Master of the Rolls or the Vice-Chancellor may be revised by the Lord Chancellor upon a proceeding in the nature of an appeal.

An appeal lies directly from the Vice-Admiralty courts of the colonies, and from other inferior admiralty courts, as well as from the High Court of Admiralty, to the king in council. This latter appellate jurisdiction has been recently regulated by statutes 2 and 3 Will. IV. c. 92, and 3 and 4 Will. IV. c. 41, by which the Court of Delegates, Commission of Review, and Commission of Appeal in Prize Causes, have been abolished.

In the ecclesiastical courts, a series of appeals is provided from the Archdeacon's Court to that of the bishop, and from the bishop to the archbishop. From the archbishop the appeal of right lay to the king in council before the Reformation; yet appeals to the Pope were in fact of common occurrence until the reign of Henry VIII., by whom an appeal was directed to be made to certain delegates named by himself. After that period, a Court of Delegates, appointed for each cause, was the ordinary appellate tribunal, until the abolition of their jurisdiction by the late act alluded to above, by which it is further provided, that no Commission of Review shall hereafter issue, but that the decision of the king in council shall be final and conclusive.

Such are the principal heads of appeal, to which we may add the appellate jurisdiction of the justices of the peace assembled at the Quarter Sessions, to whom various

statutes have given authority to hear, upon appeal, the complaints of persons alleging themselves to be aggrieved by the orders or acts of individual magistrates.

APPEAL (*appeller*, to accuse), in the old criminal law of England, was a vindictive action at the suit of the party injured by some heinous offence, in which the appellant, instead of merely seeking pecuniary compensation as in civil actions, demanded the punishment of the criminal.

It differed from an indictment in some material points. Being a proceeding instituted by a private person in respect of a wrong done to himself, the prerogative of the crown was not permitted to suspend the prosecution or to defeat it by a pardon. It seems to have been in reference to this peculiarity that the appeal is said to have been called by the celebrated Chief Justice Holt 'a noble birthright of the subject,' inasmuch as it was the only mode by which the subject could insist upon the rigorous execution of criminal justice without the risk of royal interposition on behalf of the offending party. Even a previous acquittal on an indictment for the same identical offence was no bar to the prosecution by the appellant; nor was a previous conviction a bar, where the execution of the sentence had been intercepted by a pardon. It was in the power of the appellant alone to relinquish the prosecution, either by releasing his right of appeal, or by accepting a compromise.

Another remarkable feature of appeal was the mode of trial, which in cases of treason or capital felony was either by jury or by *battle*, at the election of the defendant.

Where the latter form of trial was adopted, the following was the order of proceeding. The appellant formally charged the *appellee* with the offence: the latter distinctly denied his guilt, threw down his glove, and declared himself ready to prove his innocence by a personal combat. The challenge was accepted by the appellant, unless he had some matter to allege, in what was termed a *counterplea*, showing that the defendant was not entitled to the privilege of battle, and both parties were then put to their oaths, in which the guilt of the accused was solemnly asserted on one side and denied on the other. A day was then appointed by the court for the combat, the defendant was taken into custody, and the accuser was made to give security to appear at the time and place prefixed. On the day of battle, the parties met in the presence of the judges, armed with certain prescribed weapons, and each took a preliminary oath, of which the effect was that he had resorted to no unfair means for securing the assistance of the devil in the approaching contest. If the defendant was vanquished, sentence was passed upon him, and he was forthwith hanged. But if he was victorious, or was able to persist in the combat till starlight, or if the appellant voluntarily yielded, and cried *craven*, then the defendant was acquitted of the charge, and the appellant was not only compelled to pay damages to the accused, but was further subjected to very heavy civil penalties and disabilities.

Some of the details of this singular mode of trial, as reported by contemporary writers, are sufficiently ludicrous. Thus we are told that the combatants were allowed to be attended within the lists by *counsel*, and a *surgeon with his instruments*. In the reign of Charles I., Lord Rea, on a similar occasion, was indulged with a seat and wine for refreshment, and was further permitted to avail himself of such valuable auxiliaries as *nails, hammers, files, scissors, bodkin, needle and thread*. (See Rushworth's *Collections*, cited in Barrington's *Observations*, p. 328.) We also learn from the *Close Rolls* recently published, that parties under confinement preparatory to the trial were allowed to go out of custody for the purpose of practising or taking lessons in fencing. (See Mr. Hardy's *Introduction*, p. 185.) The whimsical combat between Horner and Peter, in the second part of *Henry VII.* has made the proceedings on an appeal familiar to the readers of Shakspeare; and the scene of a judicial duel upon a criminal accusation has been still more recently presented to us in the beautiful fictions of Sir Walter Scott.

It appears probable that the trial by battle was introduced into our jurisprudence from Normandy. The *Grand Coutumier* of that country, and the *Assizes of Jerusalem*, furnish evidence of its early existence.

The courts of criminal jurisdiction in which it was admitted were the King's Bench, the Court of Chivalry, and (in the earlier periods of our legal history) the High Court of Parliament.

In some cases the appellant was able to deprive the accused of his choice of trial, and to submit the enquiry to a

jury:—Thus, if the appellant was a female; or under age; or above the age of sixty; or in holy orders; or was a peer of the realm; or was expressly privileged from the trial by battle by some charter of the king; or laboured under some material personal defect, as loss of sight or limb; in all such cases he or she was allowed to state in a counterplea the ground of exemption, and to refer the charge to the ordinary tribunal. The party accused was also disqualified from insisting on his *waiver of battle*, where he had been detected in the very act of committing the offence, or under circumstances which precluded all question of his guilt. Indeed (if early authorities are to be trusted) it is far from clear that a criminal, apprehended *in flagranti delicto*, did not undergo the penalties of the law forthwith, without the formality of any trial at all. (See Palgrave's *English Commonwealth*, vol. i. p. 210.) The law on this latter point formed the subject of an interesting discussion in the Court of King's Bench in the year 1818, in the case of *Ashford v. Thornton*. Upon that occasion the defendant had been acquitted upon a prior indictment for the murder of a female, whom he was supposed to have previously violated. The acquittal of the accused upon evidence which appeared to many sufficient to establish his guilt occasioned great dissatisfaction, and the brother and next heir of the deceased was accordingly advised to bring the matter again under the consideration of a jury by the disused process of an appeal. The defendant waged his battle in the manner above described, and the appellant replied circumstances of such strong and pregnant suspicion as (it was contended) precluded the defendant from asserting his innocence by battle. It was, however, decided by the court that an appeal, being in its origin and nature a hostile challenge, gave to the appellee a right to insist upon fighting, and that the appellant could not deprive him of that right by a mere allegation of suspicious circumstances. The case would have proceeded in due course, if the legal antiquaries had not been disappointed of the rare spectacle of a judicial duel by the voluntary abandonment of the prosecution. In the following year an act (59 Geo. III. ch. 46) was passed to abolish all criminal appeals and trial by battle in all cases both civil and criminal.

The cases in which, by the ancient law, appeals were permitted, were treason, capital felony, mayhem, and larceny. Indeed, the earliest records of our law contain proofs that appeals were a common mode of proceeding in many ordinary breaches of the peace, which at this day are the subject of an action of trespass. The wife could prosecute an appeal for the murder of her husband; the heir made general for the murder of his ancestor; and in any case the prosecutor might lawfully compromise the suit by accepting a pecuniary satisfaction from the accused. Hence it was that the proceeding was in fact frequently resorted to for the purpose of obtaining such compensation rather than for the ostensible object of ensuring the execution of justice on the offender. (See further, Hawkins's *Crown Law*, book ii. chaps. 23 and 45. *Ashford v. Thornton*, Barnwall and Alderson's *Reports*, vol. i.; Kendall's *Argument for Construing largely*, &c. Bigby v. Kennedy, Sir Will. Blackstone's *Reports*, vol. ii. p. 714; and the ingenious speculations and remarks of Sir F. Palgrave on the origin of trial by battle, in his work on the Commonwealth of England.)

Besides the appeal by innocent or injured parties, a similar proceeding was in certain cases instituted at the suit of an accomplice. The circumstances under which this might be done will be found under the article *Approver*.

APPENZELL, the canton of, one of the twenty-two cantons or states which constitute the Swiss Confederation. It lies at the north-eastern extremity of Switzerland, and is enclosed on every side by the territory of the canton of St. Gall. Its shape is nearly circular, except on the north-east, where it forms a projection which extends towards the Rhine and the Boden See, or Lake of Constance, which it almost touches. The whole extent of the canton, according to Franconi's *Statistics of Switzerland*, is about 212 English square miles, and its population, which, in the sixteenth century, hardly amounted to 10,000, is now about 58,000. Appenzell is, next to Geneva, the most thickly inhabited canton of Switzerland, in proportion to its extent. Its territory is very mountainous, though it is not within the range of the higher Alpine chains: its mountains are calcareous, and mostly covered with rich pastures; the highest of them, called the *Sentis*, which rises on the southern border of the canton, is 7700 feet above the level of the sea.

The river Sitter, which has its source at the foot of this mountain, crosses Appenzell in a north-western direction, and afterwards joins the river Thur in the canton of Thurgau. The country of Appenzell produces but little corn, and has no vineyards, except on some of the eastern hills, which slope towards the Rheintal or valley of the Rhine. Numerous herds of cattle and flocks of sheep feed on the high lands of Appenzell: the former amount in summer to 25,000 heads. Butter and cheese are the chief produce of the *inner rhoden* or districts of this country. Honey and wax are also gathered plentifully. In the northern and western districts called *ousser rhoden*, manufactures of linen and cotton cloths, muslins, damask, &c., afford employment to a great part of the population. Herisau and Trogen are the two manufacturing towns of Appenzell. Herisau has between 7000 and 8000 inhabitants, and is a place of considerable wealth.

In its internal administration, Appenzell is divided into two distinct republics independent of each other, called interior and exterior *rhoden*, or communes. The former are Catholic, the others Protestant. The separation took place in 1597, after the wars of religion which raged in Switzerland in the sixteenth century. The two, however, count but as one canton of the Swiss confederation, and have only a single vote in the federal Diet, to which they send deputies each in its turn. Both governments are pure democracies; in each the *landsgemeinde*, or general assembly of all the male natives above eighteen years of age, meets once a year in a field, and constitutes the supreme or legislative power. Two councils constitute the executive; they propose the laws for the acceptance of the general assembly, and exercise also the high judicature of the country, for the two powers, administrative and judiciary, are often blended together in these small democracies. The *landamman* is the chief magistrate. The revenues of the state are extremely limited: those of the exterior rhoden do not ascend to 1500*l.* sterling annually, and those of the interior rhoden are still less, but the expenses are likewise trifling, for there are no establishments kept up, few public officers are paid, and those but scantily, and no national works are undertaken. The security of these little republics lies in their federal bond with the larger, more populous, and wealthier cantons of Switzerland.

The Protestant or exterior rhoden of Appenzell are more populous and industrious than the interior or Catholic districts, the inhabitants of the latter being chiefly addicted to pastoral life. It ought to be observed, however, that the interior rhoden are the most mountainous and wild, and that the people of these secluded districts, little visited by strangers, have retained much of the primitive Swiss simplicity of manners. The Catholic rhoden have a population of 15,000, while the Protestant rhoden reckon about 43,000. The *landsgemeinde*, or legislative assembly of the latter, musters about 9000 members.

The country of Appenzell was little known till the seventh or eighth century, when the Frankish kings who ruled over eastern Helvetia bestowed the royal or fiscal domains in these mountains and valleys on the Abbey of St. Gall. By degrees the abbey acquired the jurisdiction over the whole country, which was granted to it in 1292, by the Emperor Adolphus of Nassau. The abbots built a monastery dependent on that of St. Gall, which was called *Abbatis Cella*, and in German *Abten-zell*, from whence the name of Appenzell was given first to the village which grew around the monastery, and afterwards to the whole country. The inhabitants enjoyed, under the dominion of the abbey, considerable privileges and franchises; they elected their *landamman* and other magistrates, and the dues and fees they were to pay to the abbey were fixed. But under an elective government, like that of an abbey, much depended on the personal character of the abbot for the time being. Some of the abbots encroached, or allowed their bailiffs to encroach, on the liberties of these mountaineers: they levied fresh taxes on their butter and cheese, and committed various other acts of oppression. The Appenzellers complained, remonstrated, but to no great purpose. The example of their neighbours of the forest cantons, who had thrown off for similar reasons the rule of Austria, encouraged them in their resistance. In 1401, they rose in arms, surprised the castles which the abbot had built in their country, and drove his bailiffs away. A war ensued, in which first the imperial cities of Suabia, and afterwards Austria itself took the abbot's part, but the

Appenzellers waited for their enemies in the defiles of their mountains, and repeatedly defeated them. They were assisted by their neighbours of the forest cantons, by the men of Schwytz and Glarus. The war lasted several years, during which the mountaineers of Appenzell invaded the other territories of the abbot, drove him away from his abbey, overran Thurgau, and even advanced across the Rhine as far as Bregentz, in the Austrian states. At last peace was made, and the Appenzellers were recognized as an independent people; but it was not till the year 1513 that they were finally received into the Swiss confederation, of which they formed the thirteenth canton. They have ever since retained their simple form of government, and with the exception of the French invasion of 1798, have preserved their independence. During the late disturbances which have agitated Switzerland since 1830, the people of Appenzell have remained quiet. (*Geographisches und Historisches Lexicon der Schweiz*, Coxé's *Letters on Switzerland*, &c.)

APPENZELL, a town or rather large village in the inner rhoden. It is the capital of the Catholic part of the canton, and the residence of the council of government. It lies in a fine valley on the river Sitter, nine miles south of the town of St. Gall, from which there is a carriage road to it. Appenzell has two inns for travellers. Its population is about 3000. It has a convent of capuchins, and a monastery of nuns of the order of St. Clara. The mineral springs of Weissbad rise about two miles south of Appenzell. The air of this country is remarkably clear and pure; often when the low lands of Thurgau, and the banks of the lake of Constance, are enveloped in mist, Appenzell enjoys a bright sun and sky. The village and district of Gaiss, four miles N.E. of Appenzell, are celebrated as places of resort for invalids, who come here in summer to breathe the salubrious air of this elevated region, and to drink the whey which is brought warm every morning from the *chalets* or dairies of the Alps. Gaiss is about 3000 feet above the level of the sea.

APPIAN'NUS, a native of Alexandria, in Egypt, the author of an extensive history of the Roman empire, in the Greek language. The time in which he lived may be fixed from several passages in his writings. In the preface (c. 7) he speaks of an interval of two centuries between the dictatorship of Cæsar (49 or 47 B.C.) and the time when he wrote his history, which brings us to the reign of Antoninus Pius (138-161 A.D.). The date of 'nearly nine centuries' from the foundation of Rome (c. 9) leads to the same result. Moreover, he speaks of Hadrian as no longer alive, in two separate passages (*Iberica*, 38; and *Bell. Civ. i.*, 38). On the other hand, he mentions the terrible vengeance which Trajan and his generals inflicted on the Jews in the last year of his life (116, 117, A.D.), as occurring in his own time (*Bell. Civ. ii.* 90). Appian practised as an advocate at Rome under more than one emperor: and he so far won the favour of the court, that he was sent to his native country in the important office of procurator or imperial treasurer, if indeed he was not *præfectus augustalis*, or governor-general of the province of Egypt (see his preface, last chapter). His history, instead of embracing the Roman empire as a whole, treats of the several provinces separately, taking them up in succession as they become connected with Roman history, and then giving a continuous account of their relations with Rome. But to make his work a complete whole, he found it necessary to give a preliminary view of Rome under the kings, and to devote a book to the wars of Hannibal, which, running over so many countries, would otherwise have been ludicrously mutilated. The same motive led him to assign five books to the civil wars of Rome. The subjects of his twenty-two books are: 1. the regal period; 2. Italy (west of the Apennines); 3. Samnites; 4. Kelts; 5. Sicily and other islands, particularly Crete and Cyprus; 6. Spain; 7. Hannibal's wars; 8. Carthage and Numidia; 9. Macedonia and Illyria; 10. Greece and the Greek states of Lower Asia; 11. Syria; 12. Pontus; 13. the wars of Marius and Sylla; 14. those of Pompey and Cæsar; 15 and 16. the wars against the assassins of Cæsar; 17. those between Antony and Augustus; 18. 19. 20. and 21. Egypt; 22. the first century of the empire (including the reign of Vespasian). He appears also to have added afterwards histories of Dacia, Arabia, Judæa, chiefly in reference to Trajan. He speaks also of a history of his own life (Preface, c. 15). Of these, the sixth, seventh, eighth, the latter part of the ninth, the eleventh, twelfth, and those

on the Civil Wars, still exist, besides some fragments of the others. We have purposely omitted the *History of Parthia*. The work entitled *Parthica*, which is usually published with his works as part of the eleventh book, consists merely of extracts from Plutarch's *Lives of Crassus and Antony*, to which some impostor of the middle ages has prefixed a short prefatory introduction, stolen from Appian's *Syrian History*. The spurious *Parthica* appears to have existed already in the copy of Appian belonging to Photias, who died in 591. The extraordinary similarity between the supposed work of Appian and the acknowledged works of Plutarch had been long observed, and had done serious injury to the reputation of Appian. H. Stephanus, Scaliger, Casaubon, speak of him as a convicted plagiarist. On the other hand, Nylander, Freinsheim, Reimar, hold him innocent, and their opinion has been supported by some strong arguments in an essay affixed by Schweighæuser to his excellent edition. The very insertion of the Parthian history in the eleventh book with Syria is contrary to the plan of Appian's work, as the Romans had no relations with Parthia before the Mithridatic war, which is the subject of the twelfth book; and what is more decisive upon this point, he more than once in his *Civil Wars* (ii. 18, and v. 63) mentions his *intention* to treat of the Parthians in a *later* part of his work—'The Parthian history *will* show,' &c. These and other arguments may be seen in the essay of the German editor. Appian's long professional residence at Rome, as well as his Roman name, afford evidence that he had one advantage over Plutarch, as an historian, in possessing a perfect knowledge of the Latin language; but his merits in other respects are not great. His views of history are in general very superficial; and as a geographer, his ignorance is startling, when compared with the means of information which his age and circumstances offered. In speaking of the second Punic war (*Iberica*, 7), he places Saguntum (Murviedro) on the north of the Iberus, an error indeed into which Polybius may have led him. The same mistake appears again in c. 10; and in c. 12 the climax of confusion is completed by the supposition that Saguntum is the same city as Carthago Spartagena (Carthage). In the very same book, c. 6, it is asserted that the Iberus (Ebro) empties itself into the Northern Ocean: in c. 1, that Spain extends 10,000 stadia in length, and as much in breadth (thus making the surface of the country at least four times as large as it really is); and that the passage from thence to Britain is made in half a day by the tide alone.

A wretched translation of Appian into Latin was published in 1472 by Candidus, at Venice. The first edition of part of the Greek text was given at Paris in 1551 by Carolus Stephanus, with the assistance of his brother Robert. In 1551, an improved Latin translation by Gelenius was published at Basle. But these editions were all imperfect. The *Spain* and *Hannibal* were first published by H. Stephanus at Paris, in 1557. Some fragments were added by Ursinus at Antwerp, in 1582: the *Illyria*, by Hæschelius, at Augsburg, in 1599; and some more fragments by H. Valesius at Paris, in 1634. The best edition is that of Schweighæuser, Leipzig, 1785, 3 vols., 8vo. This edition contains a Latin translation, taken chiefly from that of Gelenius, and a large body of notes. A. Mai published, in 1815, a letter of Appian to Fronto in the collection of Fronto's letters; and he has also published three small fragments of Appian in the second volume of his *Script. Vet. nova Collectio*. There is a German translation by F. W. J. Dillenius, 2 vols., 8vo., Frankfort, 1793-1800; one in French, by Claude Seyssel, fol., Lyons, 1544; another by Odet Desmarres, fol., Paris, 1659; and a translation of the five books of the *Civil Wars*, by Combes Dounous, appeared at Paris, 1808, 3 vols., 8vo. An English translation of Appian's *Ancient History*, &c., was printed by Raufe Newbery and Henrie Bynnuman, in 1579, 4to.; and a translation by J. D. (Dryden or Davies) was published in folio, 1696.

APPIA VIA, an ancient road in Italy. It was first laid down as far as Capua by Appius Claudius, who afterwards, from the loss of his sight, was called Cæcus, in his censorship, B.C. 312. At a later period, it was continued as far as Brundisium. For the towns through which it passed, see **ANTONINE'S ITINERARY**, near the end. The road, parts of which still exist, was built of squared stones, closely fitted together without cement or iron, of various sizes, from one to five feet. There are two strata beneath; the first of rough stones cemented with mortar, the second of gravel, the whole being about three feet in depth. The

breadth of the road is about fourteen feet, so as to admit two carriages.

A'PPIUS CLAUDIUS. [See **CLAUDIUS.**]

APPLE, in Botany. [See **PYRUS.**]

APPLE. This fruit, which, from its hardness and great abundance, combined with its excellent flavour, is one of the most important productions of cold climates, is, in its wild state, the austere crab-apple of the hedges. At what period it first began to acquire from cultivation the sweetness and other qualities which are peculiar to it in its domesticated state, or by what accident the tendency to amelioration was first given it, we have no means of ascertaining. All that we know is, that the apple is spoken of by Homer as being one of the fruit trees cultivated in the gardens of Alcinous and of Laertes, that it was a favourite fruit of the Romans, who had many varieties, and that it has never ceased to be an object of great interest with all northern nations.

It is a most inexplicable circumstance, that while some kinds of plants will produce a great multitude of varieties when raised from seed, and are susceptible of an almost unlimited degree of improvement, there are others of very nearly a similar nature which seem almost incapable of varying at all; and yet there are so many instances of it that the fact will not admit of doubt. Among these instances are the apple and the hawthorn: millions of millions of the latter have been raised in this country alone, and yet our gardens do not contain above half-a-dozen well-marked varieties; of the apple, on the contrary, which is, botanically, closely allied to the hawthorn, the varieties are innumerable; in the last edition of the *Catalogue of the Garden of the Horticultural Society*, 1400 are described; and it is probable that this is not more than half the number really known.

In the beginning, varieties, it may be supposed, were produced accidentally, owing to the peculiar tendency to change that this species of fruit possesses. A few varieties once obtained and placed in a garden, their blossoms would be certain to fertilize each other mutually, giving and taking the peculiar properties of one another: if the seeds of these were again sown, a greater degree of variation would arise; and this being repeated from generation to generation, the progeny would soon begin to differ so much from the original parents as scarcely to be recognizable. Until within comparatively a few years, varieties were procured in no other way than in this, and by constantly destroying inferior kinds as better were obtained; but since the discovery of the effect produced by fertilizing one variety with another, a very rapid advance has taken place towards bringing the apple to its highest state of perfection, and the cultivator has no longer to trust to mere chance for the results of his experiments.

In procuring improved varieties of the apple, no other mode which leads to certain results has been discovered, than this of cross-fertilization: but, at the same time, it is believed that the following circumstances ought to be kept in view: 1st, the seed from which the new variety is to be obtained should be fully formed, and 2d, it should be taken from as perfect a specimen as it may be practicable to procure; for it has been found by experience, that any debility or defect in the parent is, in fruit trees, very apt to be communicated to their offspring. No person has been more successful in experiments of this kind than Mr. Knight, the President of the Horticultural Society, who thus describes his method of proceeding. 'Many varieties of the apple were collected, which had been proved to afford, in mixture with each other, the finest ciders: a tree of each was then obtained by grafting upon a paradise stock, and these trees were trained to a south wall, or if grafted on a Siberian crab, to a west wall, till they afforded blossoms, and the soil in which they were planted was made of the most rich and favourable kind. Each blossom of this species of fruit contains about twenty stamens, or males, and generally five pointals, or females, which spring from the centre of the cup, or cavity of the blossom. The males stand in a circle just within the bases of the petals, or flower leaves, and are formed of slender threads, each of which terminates in a small yellow ball, or anther. It is necessary, in these experiments, that both the fruit and seed should attain as large a size, and as much perfection, as possible; and, therefore, a few blossoms only were suffered to remain upon each tree from which it was intended to obtain seeds. As soon as the blossoms were nearly full grown, every male in each was carefully extracted, proper care being taken not to injure the pointals or females; and the blossoms,

thus prepared, were closed again, and suffered to remain till they opened spontaneously. The blossoms of the tree which it was proposed to make the male parent of the future variety were accelerated by being brought into contact with the wall, or retarded by being detached from it, so that those were made to unfold at the required period; and a portion of their pollen or farina, when ready to fall from the mature anthers, was, during three or four successive mornings, deposited upon the pointals of the blossoms, which consequently afforded seeds. It is necessary in this experiment that one variety of apple only should bear un-mutilated blossoms: for where other varieties are in flower at the same time, the pollen of these will often be conveyed by bees to the prepared blossoms; and the result of the experiment will in consequence be uncertain and unsatisfactory.'

'Every seed, though many be taken from a single apple, will afford a new and distinct variety, which will generally be found to bear some resemblance to each of its parents. Examples of this are presented in the Grange apple and Downton pippin, and in the Foxley apple and Siberian Harvey.'

Of all the apples cultivated by our ancestors, a very small number only is known to the present generation. This may have been owing to their having gradually given way to better kinds; but, in the opinion of Mr. Knight, it is rather to be ascribed to an expenditure of their vital principle. This distinguished physiologist is of opinion, that no varieties of fruit trees are capable of remaining in perfection beyond a limited number of years: he thinks that after that period they suffer from the debility attendant upon old age, and that, although their existence may be protracted by means of grafting or budding them upon healthy stocks, yet that in the end they will entirely disappear. This opinion is founded upon the well-known fact, that the oldest varieties of the apple are now the most diseased, especially the celebrated golden pippin, which was formerly the common hardy cider-apple of the Herefordshire orchards, but which is now only preserved with difficulty in gardens. But it must be remembered, that however plausible this theory may be, it is open to several objections, among which more especially are the following: it is not impossible that the varieties alluded to by Mr. Knight were originally less hardy than those now cultivated, and that their constitutions were not adapted to the cold summers which generally prevail at the present epoch in England,—a supposition which is rendered the more probable by the circumstance, that the golden pippin still flourishes in all its pristine vigour in the island of Madeira. It may also be conjectured that neglect was a great cause of the disappearance of the golden pippin, and other kinds, from the cider orchards: for if, as is so often the case, the trees were once allowed to fall into a state of decay, then every scion taken from such trees for the purpose of propagation would carry its own debility along with it; and thus a disease, acquired in the first instance by neglect, would be perpetuated according to the well known laws of vegetable physiology. (See Lindley's *Outline of the First Principles of Horticulture*, p. 24, &c.)

It is not our intention in this place to enter into any detailed account of the varieties of the apple, for which we must refer our readers to works treating exclusively on such subjects, especially to the *Guide to the Orchard and Kitchen Garden*: we shall rather confine ourselves to topics of general interest, such as the selection of varieties for small gardens or orchards, the modes of pruning and planting the trees, keeping the fruit when gathered, and propagation.

England is celebrated for the excellence of its cider; a beverage which perhaps acquires its highest degree of excellence in Herefordshire, and the neighbouring counties. In those districts, it has been found that the best varieties are the *forchelp*, a worn-out sort, much used for mixing with other kinds, to which it communicates strength and flavour: the *red must*; the *hagloe crab*, which, however, is only good in a dry soil, on a basis of calcareous stone, in a warm situation and season; the *grange apple*; the *orange pippin*; the *forest styre*, which is supposed to produce a stronger cider than any other, but is not a good bearer: the *yellow Elliot*; the *Bennett*; the *Siberian Harvey*; *Stead's kernel*; the *friar*, which is very hardy; and above all, the *golden Harvey*, or *brandy apple*. The specific gravity of the juice of these varieties has been stated by Mr. Knight to be as follows:

Foxwhelp . . . 1076-1080 Yellow Elliot . . . 1076
 Red must . . . 1064 Bennett . . . 1073
 Hagloe crab . . . 1081 Siberian Harvey . . . 1091
 Grange . . . 1079 Stead's kernel . . . 1074
 Orange pippin . . . 1074 Friar . . . 1073
 Forest styre . . . 1076-1081 Golden Harvey . . . 1085
 Besides these, the *coccagee* and the *Siberian bitter-sweet* are in much estimation.

For the kitchen, the apple is certainly, of all fruits, the most useful; and perhaps it is here that its utility to man is most conspicuous, because it proves, when cooked, a nutritious and wholesome food. In every district there is an abundance of local varieties, which are considered by their cultivators as of peculiar excellence. But for those who are anxious to possess the kinds which have been determined by comparison to be the best of all, we should recommend the following: for summer use, the *Keswick codlin* and the *Hawthornden*; for autumn, the *Wormsley pippin* and the *Alfriston*; for winter and spring, the *Bedfordshire foundling*, *Dumelow's seedling*, *Dr. Harvey*, *Brabant Bellefleur*, and *Gravenstein*; and for drying, the *Norfolk Beauty*. Of all these, the *Gravenstein*, *Alfriston*, and *Brabant Bellefleur* are the best.

Of table apples, the varieties are endless; but by far the greater part of the local sorts, and of those commonly cultivated, is of only second-rate quality. The finest variety of all is the *Cornish gilliflower*; no other equals this in excellence, but it is unfortunately a bad bearer. Of those which combine productiveness and healthiness with the highest quality, the six following must be considered the best: *golden Harvey*, *old nonpareil*, *Hubbard's pearmain*, *Ribston pippin*, *Dutch mignonne*, *Court of Wick*. Finally, the best selection that could be made for a small garden, so as to obtain a constant succession of fruit from the earliest to the latest season, would be the following, which are enumerated in their order of ripening, the first being fit for use in June, and the last keeping till the end of April.

White Juneating.	Fearn's pippin.
Early red Margaret.	Court of Wick.
White Astrachan.	Golden Harvey.
Sugar-loaf pippin.	Golden pippin.
Borovitsky.	Beachamwell.
Oslin.	Adam's pearmain.
Summer golden pippin.	Pennington's seedling.
Summer Thorle.	Hughes's golden pippin.
Dutchess of Oldenburgh.	Cornish gilliflower.
Wormsley pippin.	Dutch mignonne.
Kerry pippin.	Reinette du Canada.
Yellow Ingestrie.	Syke-house russet.
Gravenstein.	Braddick's nonpareil.
Autumn pearmain.	Old nonpareil.
Golden reinette.	Court-pendu plat.
King of the pippins.	Lamb-Abbey pearmain.
Ribston pippin.	Newtown pippin.

In *pruning* the apple-tree, as indeed in all similar cases, three objects are chiefly kept in view: the first of which is to remove superfluous, or excessively vigorous shoots; the second is to admit light and air to all parts equally; and the third is to check exuberance, and thus to promote fruitfulness. The mode of proceeding in the two first cases is so obvious as not to require explanation: for the third, a few simple rules will suffice. As the apple is a tree of very hardy habits, if its branches are allowed to go unpruned, they will not produce any considerable number of lateral shoots, but will have a great tendency to keep lengthening from their terminal buds, which always produce barren and vigorous shoots; it is the lateral shoots only that are fertile, and they are so only when stunted, or in the state of what are technically called *spurs*. The mode of procedure is then obviously to destroy the terminal barren shoots, and to encourage the lateral fertile ones. This is effected by shortening back all the leading shoots every year, to a distance from their point of origin, which varies according to their strength: where they are very strong, the leading shoots should not be reduced more than within twelve or fifteen inches of their base, but when they are weaker, they may be cut to within nine inches. By this means the onward growth of the branch is momentarily arrested; the ascending sap is impelled into the lateral buds, which are thus developed, and form branches, some of which will be sure to grow so slowly as to become productive; for notwithstanding the check the branch may receive from

the amputation, it will after a little while again lengthen by means of the bud nearest its extremity, and this latter will then grow so fast as effectually to hinder the new lateral shoots from acquiring much vigour. Of the lateral shoots then obtained, some will be required to form new branches, others will be reserved for fruiting, and others will at once become fruit spurs; the first will be treated as those from which they sprang, the second are to be cut down to within an inch of the bottom, which will generally cause the surrounding eyes to form fruit spurs; the third will be left until they have borne fruit, when they are cut out so as to leave only a single bud behind. In all cases, the fruit spurs, which, like the leading branches, have a tendency to lengthen, should have that tendency stopped by being cut back to the length of about three inches.

Apple-trees are trained in the form either of *standards*, *dwarfs*, *espaliers*, or *balloons*.

No particular care is requisite in the management of *standards* beyond providing them with a straight stem six feet high, and a head consisting of three or four healthy shoots to commence with; and afterwards keeping the branches so pruned that they do not chafe against each other in windy weather, nor overshadow each other: all the rest is generally provided for sufficiently by nature herself. They are principally employed in planting orchards, being now seldom admitted into good gardens. As these orchards are of inestimable value to the farmer and the peasant, the best mode of planting them cannot be too generally understood: we therefore select, from many others, the following method recommended by Mr. Knight. 'Let a soil of good quality be selected for a nursery, which should be trenched eighteen inches deep, and planted with seedling crab stocks of one year old, each plant being placed at the distance of six feet from the others. These will be fit for grafting at two years old; and an acre of ground, thus planted, will contain about 1500 trees, and, consequently, enough to plant about forty acres, where each tree stands at twelve yards distance from others. A nursery thus planted, when the trees are seven or eight years old from the seed, will form a more productive orchard than can be obtained by any other means with which I am acquainted; and during the earlier periods of the growth of the trees, they will be rather benefited than injured if the ground be planted with potatoes, or other low-growing crops, with proper manure. During the growth of the trees in the nursery, they should not be pruned to single stems, without leaves, as is usually done in nurseries, but each should retain many small lateral branches, which will tend to make the young trees grow strong and taper in their stems, and will afford much fruit whilst the trees are very young. I would recommend the *Downton* pippin for an experiment of this kind, in preference to any other variety.

'At the end of eight or nine years from the time when the trees are first planted, they will have covered with their branches the whole surface of the ground, and will then begin to injure each other, if the whole be suffered to remain. At this period, therefore, every other row of trees, and at no distant subsequent period, every other tree in the remaining rows, must be taken away; and if this be done with proper care, and leaving the roots at least two feet long upon each side of the trunks, such trees may be removed with still less risk than such as are much smaller. But to insure success, it will be necessary to take off much the greater part of the lateral branches; and the holes in which the trees are to be planted must be made not less than six feet wide, and eighteen inches deep, placing the turf, if the field be pasture, in the bottom, and taking care that the trees be not planted deeper in the soil than they previously grew. Each tree will require, during the first year, a stake and a few bushes to protect it; after which, nothing more will be wanting than to wash its trunk annually with lime and water, and cow dung, to defend it from the teeth of sheep and cattle.'

For garden purposes, *dwarf* apple-trees are so far superior to all others, that they are now almost exclusively planted. Independently of the little space they occupy, the small degree in which they overshadow the soil, and the great facility they offer for gathering their fruit, they are generally so much beyond the influence of high winds as to have but little of their crop blown down by autumnal gales, and their fruit is also finer than on standards. No directions for their management can be given better than the

following excellent observations of the author of the *Guide to the Orchard and Fruit Garden*.

'Trees for this purpose should have their branches of an equal strength: those which have been grafted one year, or what are termed by nurserymen Maiden plants, are the best; they should not be cut down when planted, but should stand a year, and then be headed down to the length of four or six inches, according to their strength; these will produce three or four shoots from each cut-down branch, which will be sufficient to form a head. At the end of the second year, two or three of the best placed of these from each branch should be selected, and shortened back to nine, twelve, or fifteen inches each, according to their strength, taking care to keep the head perfectly balanced (if the expression may be allowed), so that one side shall not be higher nor more numerous in its branches than the other: and all must be kept, as near as may be, at an equal distance from each other. If this regularity in forming the head be attended to and effected at first, there will be no difficulty in keeping it so afterwards, by observing either to prune to that bud immediately on the inside, next to the centre of the tree, or that immediately on the outside. By this means, viewing it from the centre, the branches will be produced in a perpendicular line from the eye; whereas, if pruned to a bud on the right or left side of the branch, the young shoot will be produced in the same direction; so that if the branches formed round a circle be not thus pruned to the eyes, on the right successively, or the left successively, a very material difference will be found, and the regularity of the tree will be destroyed in one single year's pruning; which may be readily illustrated thus:—fix four branches, either in a direct line or to a circular hoop, at the distance of eight inches from each other: let the branch on the left be called *a*, the second *b*, the third *c*, the fourth *d*; head down *a* to the left-hand bud; *b* to the right, *c* to the left, and *d* to the right. When these have grown a year, those between *a* and *b*, and between *c* and *d*, will be ten inches: thus the distances now are not as eight to eight, but as six to ten; which would require two years' pruning in a contrary direction to restore the head to its former regularity; and it must not be forgotten that this system of pruning will hold good in every other case.

What has just been said has reference only to the leading shoots, which are always produced from the terminal buds when pruned, and which alone form the figure and beauty of the tree. The intermediate space must of course be provided for at the same time, having a regard to the number of branches thus employed, that they do not crowd each other. On the contrary, they must be kept thin, and perfectly open, so as to admit plenty of sun and air, without which the fruit produced will be small and good for but little: the middle of the tree, indeed, must be kept quite open from the first to the last, taking care that all the surrounding branches lead outwards, and preserve a regular distance from each other.'

Espalier apple-trees were formerly much used, but they are in all respects so greatly inferior to dwarfs, and so much more expensive to keep in good order, that we omit all further notice of them.

A mode of managing apple-trees called *Balloon* training has been much recommended. It consists simply in this: you plant a common standard tree, with a stem six or seven feet high, and with five or six good equal-sized branches; to the tip of each branch is to be attached a cord which passes under a peg driven into the ground near the stem, and by means of which the branches may be gradually drawn downwards so as to become inverted, when, from the breadth of the part of the tree whence the branches diverge, and the approximation of their points, the whole assumes the appearance of a balloon. All the care that these trees require is, to have their branches kept at equal distances by means of a hoop, or some such contrivance, until they are strong enough to preserve their acquired direction, and to have all the shoots which will every year spring upwards from them carefully cut away, except such as can be brought down so as to fill up the spaces in the circumference of the balloon head. Trees thus managed produce an abundance of spurs, and when loaded with fruit are beautiful objects; like dwarfs, they occupy but little room, and their crop is not liable to be blown down; but they have this very great disadvantage, that all their buds are exposed to the sky in the spring, when they flower: consequently they are liable to suffer very much from the effect of spring

frosts; so that they will scarcely ever bear, except in very favourable seasons, or in very mild and sheltered places. It is, in fact, only into gardens sloping to the south or south-west, and on the sides of valleys, that balloon apple-trees should be admitted.

Many different methods of *preserving* apples have been recommended, and almost every one has some favourite plan of his own. As far as our own experience goes, the best mode is to allow the fruits, after being gathered, to lie till their superfluous moisture has evaporated, which is what is technically called *sweating*; the apples should then be wiped quite dry, wrapped in tissue paper, and stowed away in jars or chests of pure silver sand which has been previously dried in an oven. They should always be taken out of the sand a few days before they are wanted, and laid in dry fern or some such substance; they then absorb oxygen, and acquire a little sweetness, which is necessary to their perfection.

The apple is *propagated* by either budding or grafting: the former practice is preferable for standards, the latter for dwarfs. The stocks that are employed are the wild crab, the doucin or English paradise, and the French paradise apple. The former should be used for standards only, as it imparts too much vigour to the scions to render them manageable as dwarfs; the French paradise should always be employed for the latter, as it has the property of stunting the shoots, and rendering them much more fertile. The doucin or English paradise stock, which is what the English nurserymen usually sell as *the* paradise stock, is intermediate in its effect between the crab and the French paradise, being less vigorous than the first and more so than the last. When there is no wish to confine the dwarf trees within a very narrow compass, this kind of stock, which is harder than the French paradise, is the proper one to employ; but if the dwarfest trees that can be procured are the objects of the cultivator, then the latter only should be planted.

In conclusion, it is only necessary to add that the proper season for planting the apple is in October or November, as soon as the leaves are dead or discoloured, and beginning to drop. Vegetation at that season is not altogether torpid, but goes on just enough to enable the plants to send out a few rootlets before winter, and to prepare themselves for taking advantage of the first period of growth in the succeeding spring—a period, the commencement of which is never exactly known by external indications.

APPLE, LOVE. [See LOVE APPLE.]

APPLE, PINE. [See PINE APPLE.]

APPLEBY, a market town and borough in the county of Westmoreland, of which it is the capital; 270 miles N.N.W. from London, and 31 S.E. of Carlisle, 54° 35' N. lat., 2° 28' W. long. It is upon the river Eden, which falls into the Solway Frith below Carlisle: and is by no means of such extent or importance as formerly. It is supposed by some that Appleby was a Roman station, but there is at least no decisive evidence of this; and no Roman antiquities have been discovered. It was, however, a place of some importance before the conquest, and continued to be so until the time of Henry II., in the 22d year of whose reign it was surprised and utterly destroyed by William, King of Scotland. A second calamity of a similar kind in the 12th year of Richard II., A.D. 1388, completed the misfortunes of Appleby*. It never recovered from this blow. The greatest part still lay in ruins in the time of Philip and Mary, and on this account the rent due to the crown was reduced from twenty marks annually to two marks, or 1*l.* 6*s.* 8*d.* Burials, a small place at the distance of nearly a mile, is supposed to be derived from burgh walls; and the remains of buildings have been dug or ploughed up two or three miles from where the town now stands.

Appleby contains two parishes, St. Lawrence on the left, and St. Michael on the right side of the river. In St. Lawrence is the greater part of the town; in St. Michael a few houses only which can be considered part of the town, the parish of St. Michael being an agricultural one. The parishes are separate vicarages. The high road from London to Carlisle through Brough and Penrith passes through the latter; and a short street and an ancient stone bridge of two arches over the Eden lead into the main street of Appleby, which is irregularly built on the slope of a hill. The castle

* There is some difference in the dates assigned to the first of these events. Nicholson and Burn (*Hist. of Cumberland and Westmoreland*) give the 22d of Henry II.; but it was in this year that the fine for delivering up the place was levied on the governor, and the event might have occurred a year or two before.

stands on a lofty height rising from the river at the upper end of the main street, and at the lower end is the parish-church of St. Lawrence. The keep of the castle is in good preservation. It is called Caesar's Tower, but is not of Roman origin, though it is of great antiquity. The principal part of the present edifice was built in 1686, by the then Earl of Thanet, in whose family it still remains. The church of St. Lawrence was nearly rebuilt in 1655, by the Countess of Pembroke. Near the church is the market-house, rebuilt in 1811 in the Gothic style. The town-hall and shambles are incommensurably placed in the middle of the main street: at each end of the town is an ancient stone obelisk. The shire-hall and new gaol are in the parish of St. Michael or Bondgate, in the part of Appleby which lies on the north-east or right bank of the Eden. Both the Lent and Summer assizes are held here, and the judges when on circuit have from time immemorial been entertained at the castle.

Towards the upper end of the town is an almshouse or hospital, for twelve widows and a superior, or 'mother,' founded by the above-mentioned Countess of Pembroke; and near the church is a grammar-school, established in the time of Elizabeth. The income of the school is or was 204*l.* 1*s.* 7*d.*; the number of free scholars is six. (*Digest of Reports, &c. on Public Charities*, p. 622.)

The market is on Saturday, chiefly for corn; and there are several fairs for cattle, horses, sheep, and linen-cloth: especially a cattle-fair once a fortnight from Whitsun-eve to Michaelmas. The population of the borough of Appleby was, in 1831, 851, and of the town-ship of Bondgate and Langton 645, together 1496: but the parishes of St. Lawrence and St. Michael had 1459 and 1261 inhabitants respectively.

The corporation consists of a mayor, twelve aldermen, sixteen common-councilmen, and other officers. The borough returned two members up to the passing of the Reform Bill, by which it was disfranchised.

Appleby was distinguished by its adherence to Charles I. in the contest between that prince and his parliament. The Countess of Pembroke fortified the castle for the king, but it was forced to surrender.

APPOGGIATURA, in music (from the Italian verb *appoggiare*, to lean on), commonly called a grace note, or note of embellishment, but more correctly, a note of expression. This is invariably written in a smaller character than the essential notes of the melody. The term explains itself: the *appoggiatura* should always have more or less pressure of the breath or hand, being, where the notation is accurate, used for the purposes of emphasis, especially in recitative, where it is quite as important as the notes in a larger character. But in recitative it is a practice as common as erroneous, to write notes *not* meant to be sung, presuming that the singer will suppose notes to be intended which are not represented. Thus Handel, in his *Jephtha*, has written a recitative in the following manner:—

Such news flies swiftly, I've

heard the mourn-ful cause of all your sor-rows—

Such news flies swift-ly, I've

heard the mourn-ful cause of all your sor-rows.

It may however be a question, whether a note having a syllable appropriated solely to it, can properly be called an *appoggiatura*; but all writers on the subject do, nevertheless, so term it.

The *appoggiatura* takes its length, or duration, from the note it precedes, whence it almost invariably abstracts one-

half; except in the case of a dotted or pointed note, from which it takes two-thirds. Example:—

As written.

As performed.

Occasionally, the small note is not only written, but intended to be performed, as a very short one. For instance: a small semiquaver sometimes precedes a crotchet, or a minim, where, if it leap from a distance above to the principal note, which is rare, it is merely a note of animation. If it be the semitone, the octave, or indeed any interval below the principal note, it is then called an *acciaccatura*, or *crushing* note, (from *acciaccare*, to crush, to pound,) and is to be forced and short. The *appoggiatura*, M. Framery observes, gives tenderness to the air; it therefore is not adapted to music of an energetic or majestic kind. In the hands of an accomplished performer it is the most expressive, the most impassioned, addition intrusted to his discretion. But modern composers, unwilling, perhaps, to repose too much confidence in those who are to execute their works, generally write all that they mean to be introduced, trusting nothing to the judgment of the performer.

APPRAISEMENT, from *apprécier*, *appriser*, or *appraiser*, 'to set a price upon an article.' When goods have been taken under a distress for rent, it is necessary, in order to enable the landlord to sell them according to the provisions of the statute 2 William and Mary, sess. i. c. 5, that they should be previously appraised or valued by two appraisers. These appraisers are sworn by the sheriff, under-sheriff, or constable, to appraise the goods truly according to the best of their understanding. After such an appraisement has been made, the landlord may proceed to sell the goods for the best price that can be procured. By the statute 48 Geo. III. c. 140, an *ad valorem* stamp duty is imposed upon appraisements.

APPRAISERS are persons employed to value property. By the statute 46 Geo. III. c. 43, it was first required that any person exercising the calling of an appraiser should annually take out a license to act as such, stating his name and place of abode, and signed by two commissioners of stamps. By the same statute a stamp duty of 6*s.* was imposed upon such licenses; and unlicensed persons were forbidden to act as appraisers under a penalty of 50*l.* The same duty has been continued by the General Stamp Act, 48 Geo. III. c. 149.

APPRENTICE, from *apprendre*, to learn, signifies a person bound by indenture to serve a master for a certain term, receiving, in return for his services, instruction in his master's profession, art, or occupation. In addition to this, the master is usually bound to provide the necessary food and clothing for the apprentice, and sometimes to pay him small wages, but most commonly the master receives a premium. Formerly the word was used to denote those students of the common law in the societies of the inns of court who— not having completed their professional education by ten years' study in those societies, at which time they were qualified to leave their inns and to execute the full office of an advocate, upon being called by writ to take upon them the degree of serjeant-at-law—were yet of sufficient standing to be allowed to practise in all courts of law except the court of Common Pleas. This denomination of apprentice (in law Latin, *apprenticii ad legem nobiliores*, *apprenticii ad barras*, or simply *apprenticii ad legem*) appears to have continued until the close of the sixteenth century, after which this term fell into disuse, and we find the same class of advocates designated, from their pleading without the bar, as *outer barristers*, now shortened into the well-known term, *barristers*. (See *Spelman's Gloss. ad verbum*; *Blackstone's Commentaries*, vol. i. 23; vol. iii. 27.)

Apprenticeship appears to have been unknown to the ancients; and although it has been stated that in Rome the distribution of the citizens into companies or colleges according to their trades took place at an early period, we can discern in the Roman history no distinct traces of such a system as apprenticeship. Its origin is to be sought in

the institutions of modern Europe, and it probably sprung up in conjunction with the system of associating handicraft trades in the twelfth century, the natural result, perhaps, of those more general combinations of citizens or of burghesses, which were formed for the purposes of mutual protection against feudal oppression. The restraint of free competition, the assertion of peculiar privileges, and the limitation of the numbers of such as should participate in them, were the main results to which these institutions tended; and for these purposes a more obvious or effective instrument than apprenticeship could hardly be found. To exercise a trade, it was necessary to be free of the company or fraternity of that trade; and as the principal if not the only mode of acquiring this freedom in early times was by serving an apprenticeship to a member of the body, it became easy to limit the numbers admitted to this privilege, either indirectly by the length of apprenticeship required, or more immediately by limiting the number of apprentices to be taken by each master. So strict in some instances were these regulations, that no master was allowed to take as an apprentice any but his own son. In agriculture, apprenticeship, though in some comparatively later instances encouraged by positive laws, has never prevailed to any great extent, which is probably to be attributed to its origin as a part of the system of associated trades. The tendency to association indeed is not strong among the agricultural population, combination being, to the scattered inhabitants of the country, inconvenient and often impracticable; whereas the inhabitants of towns are, by their very position, invited to it.

Subsequently to the twelfth century, apprenticeship has prevailed in almost every part of Europe. In France, Germany, Italy, and Spain, it may be distinctly traced, and it probably existed in various other countries. It is asserted by Adam Smith, that seven years seem antiently to have been all over Europe the usual term established for the duration of apprenticeships in most trades. There seems, however, to have been no settled rule on this subject, for here is abundant evidence to show that the custom in this respect varied not only in different countries, but in different incorporated trades in the same town.

In Italy, the Latin term for the contract of apprenticeship was *accoutentulatio*. From an old form of an Italian instrument, given by Beier in his learned work *De Collegiis Opificum*, it appears that the contract, which in most respects closely resembled English indentures of apprenticeship, was signed by the father or other friend of the boy who was to be bound, and not by the boy himself, the latter testifying his consent to the agreement merely by being present.

In France, the trading associations prevailed to a great extent under the names of 'Corps de Marchands' and 'Communautés.' At the latter end of the seventeenth century, there were in Paris six 'Corps de Marchands,' and one hundred and twenty-nine 'Communautés,' or companies of tradesmen, each fraternity having their own rules and laws. Among these bodies the duration of apprenticeship varied from three to eight or ten years. It was an invariable rule in the 'Corps de Marchands,' which was generally followed in the 'Communautés,' that no master should have more than one apprentice at a time. There was also a regulation that no one could exercise his trade as a master until, in addition to his apprenticeship, he had served a certain number of years as a journeyman. During the latter term he was called the 'compagnon' of his master, and the term itself was called his 'compagnonage.' He had also, before being admitted to practise his trade as master, to deliver to the 'jurande,' or wardens of the company, a specimen of his proficiency in his art, called his 'chef d'œuvre.' He was then said 'aspirer à la maîtrise.' The sons of merchants living in their fathers' house till seventeen years of age, and following his trade, were reputed to have served their apprenticeship, and became entitled to the privileges incidental to it without being actually bound. These companies or associations were finally abolished at the revolution, when a perfect freedom of industry was recognized by the laws, and this, with a few exceptions, has continued to the present day. But though the contract of apprenticeship has ceased in France to be imperative upon the artisan, it has not fallen into disuse; and an act passed the 12th of April, 1803, prescribes the rights and duties both of master and apprentice. It does not, however, lay down any particular form, and leaves the

time and other conditions of the contract to be determined by the parties.

In Germany, though we find the same institution, it varies not only in the name, but has some other remarkable peculiarities. The companies there called *gilden*, *zünfte*, or *innungen*, appear to have exercised in many respects a sort of judicial control over their members, and, either on account of moral or physical defects, to have refused admission to applicants for freedom at the discretion of the elders or masters. They seem to have occasionally admitted workmen who had not served a regular apprenticeship into the lower class of members of a trade; but to become masters was only allowed to those who had gone through the regular stages of instruction. The course which continues to the present day is as follows:—The apprentice, after having served the term prescribed by his indenture (*aufzings-brief*), is admitted into the company as a companion (*gesell*), which corresponds in many respects to the French *compagnon*. Having passed through the years of his apprenticeship, called *lehr-jahre*, satisfactorily, he becomes entitled to receive from the masters and companions of the guild a certificate, or general letter of recommendation (*kundschaft*), which testifies that he has duly served his apprenticeship, and has been admitted a member of the company, and commands him to the good offices of the societies of the same craft, wherever he may apply for them. With this certificate the young artisan sets out on his travels, which often occupy several years, called *wandel-jahre*, supporting himself by working as a journeyman in his particular art or trade in the various towns in which he temporarily establishes himself, and availing himself of his *kundschaft* to procure admission into the fellowship and privileges of his brother workmen of the same craft. On his return home, he is entitled, upon producing certificates of his good conduct during his *wandel-jahre*, to become a master. In Germany, the periods of servitude have varied in different states and at different periods; in general, the term is seven years; but in some instances an apprenticeship of five or three years is sufficient.

Neither in Ireland nor in Scotland have the laws relating to associated trades or apprentices been very rigorously enforced. In the former, the same system of guilds and companies certainly existed; but, as it was the policy of the English government to encourage settlers there, little attention was paid to their exclusive privileges; and in 1672 the Lord Lieutenant and Council, under authority of an Act of Parliament, issued a set of rules and regulations for all the walled towns in Ireland, by which any foreigner was allowed to become free of the guilds and fraternities of tradesmen on payment of a fine of 20s. A statute containing very similar enactments was passed in 19 George III. The term of apprenticeship, also, in Ireland, was of a moderate length, five years being required by 2 Anne, c. 4, for the linen manufacture, which, by 10 George I. c. 2, was reduced to four years. It is asserted by Adam Smith, that there is no country in Europe in which corporation laws

so little oppressive as in Scotland. Three years are there a common term of apprenticeship even in the nicer trades, but there is no general law on the subject, the custom being different in different communities.

It is, perhaps, impossible to ascertain precisely at what time apprenticeships first came into general use in England. But that the institution is one of very old date is certain, being probably contemporaneous with the formation of the guilds or companies of tradesmen. In the statutes of the realm, however, there is no reference to such an institution for about 200 years after the guilds are known to have existed, apprentices being first incidentally noticed in an act (12 Rich. II. c. 3) passed in 1385. But that about this time apprenticeship had become extremely common is proved by a statute passed in 1405-6 (7 Henry IV. c. 17), which contains the singular enactment, that no one shall bind his son or daughter apprentice unless he have land or rent to the value of 20s. by the year; the cause of which provision is stated to be the scarcity of labourers in husbandry, in consequence of the custom of binding children apprentices to trades. In the act (8 Henry VI. c. 11) which repealed this statute in favour of the city of London, the putting and taking of apprentices is stated to have been at that time a custom of London time out of mind. The same statute was repealed (by the 11th Henry VII. c. 11) in favour of the citizens of Norwich, and (by the 12th Henry VII. c. 1) in favour of the worsted-makers of Norfolk; and in the former

act we find the first mention of any particular term of servitude, the custom of the worsted-sheerers of Norwich being confirmed by it, which required an apprenticeship of seven years. Except in London, it does not appear that at an early period there was in England any uniform practice in this respect, but that the duration of the apprenticeship was a matter for agreement between the parties to the contract. In Madox's *Formulare Anglicanum*, there is an indenture of apprenticeship dated in the reign of Henry IV., which is nearly in the same form as the modern instrument; and in that case the binding is to a carpenter for six years. It is, however, probable that before the statute of the 5th Eliz. c. 4, the term of apprenticeship was seldom less than seven years. In London, the period of seven years at the least was expressly prescribed by the custom as the shortest term; and Sir Thomas Smith, in his *Commonwealth of England*, written about the time of the passing of the statute of Eliz., says, in reference to the previous practice, that the apprentice 'serveth, some for seven or eight years, some nine or ten years, as the master and the friends of the young man shall think meet, or can agree together.'

The statute of the 5 and 6 Edw. VI. c. 8, which enacts that no person shall weave broad woollen cloth, unless he have served a seven years' apprenticeship, may be adduced as a further proof that this term was fast becoming the customary one, when, by the 5th Eliz. c. 1, it was made the law of the land, and one uniform practice in all trades introduced throughout England. But neither by that statute, nor by the customs of London and Norwich, which were excepted by the act, was a longer term of apprenticeship than seven years forbidden.

The London apprentices, in early times, were an important, and often a formidable body. They derived consequence from their numbers, the superior birth of many of them, and the wealth of their masters, but particularly from their union, and the spirit of freemasonry which prevailed among them. The author of a curious poem published in 1617, entitled *The Honour of London Apprentices*, observes, in his preface, that 'from all shires and counties of the kingdom of England and dominion of Wales, the sons of knights, esquires, gentlemen, ministers, yeomen, and tradesmen, come up from their particular places of nativity and are bound to be prentices in London.' He also mentions 'the unanimous correspondence that is amongst that innumerable company.'

It may be readily supposed that such a body, in the midst of a large metropolis, densely crowded with population, and frequented by strangers of all kinds, was not a little obnoxious to the police; and accordingly, we find in the sixteenth and seventeenth centuries a constant succession of tumults, and some instances of serious and alarming insurrections arising among the apprentices. Thus the fatal riot in London against foreign artificers, which took place on the 1st of May, 1517, and from which that day was called 'Evil May Day,' was commenced and encouraged by the apprentices.

In the year 1595, certain apprentices in London were imprisoned by the Star-Chamber for a riot; upon which, several of their fellows assembled and released them by breaking open the prisons. Many of these were taken and publicly whipped by order of the Lord Mayor. This caused a much more formidable disturbance; for 200 or 300 apprentices assembled in Tower-street, and marched with a drum in a warlike manner to take possession of the person of the Lord Mayor, and, upon the principle of retaliation, to whip him through the streets. Several of the ringleaders in this riot were tried and convicted of high treason. (See *Criminal Trials*, vol. i. p. 317.)

In the troubles of the civil wars the apprentices of London took an active part as a political body; numerous petitions were presented from them to the parliament, and they received the thanks of the House 'for their good affections.' Nor did they confine their interference merely to petitions, but, under sanction of an ordinance of parliament promising to them security against forfeiture of their indentures, they were enrolled into a sort of militia. They also took part in the restoration, and in the reign of Charles II. they were frequently engaged in tumults. The last serious riot in which they were concerned took place in 1668. On this occasion they assembled themselves tumultuously together during the holidays, and proceeded to pull down the disorderly houses in the city. For this exploit, several of them were tried and executed for high treason.

In 1681, when Charles II. was desirous of strengthening his hands in every way against the corporation of London, he thought it necessary to endeavour to secure the favour of the apprentices, and sent them a brace of bucks for their annual dinner at Sadlers' Hall, where several of his principal courtiers dined with them. The apprentices, however, were divided in opinion; for there were numerous petitions from them both for and against the measures of the court.

Subsequently to this time their union appears to have been gradually dissolved, and we do not find them again acting together in a body. After they had ceased however to form a separate class, the laws which had called them into existence, though partially repealed as to some trades, continued generally in force; nor was it until a very late period that the progress of more liberal opinions finally put an end to them. But the exclusive spirit which had dictated them was so far modified by the spirit of English liberty, that the monopolies upheld by them were never so strictly enforced, nor the evil of them so much felt in this country as on the continent. For not only were the apprentice-laws condemned by the liberal and speculative philosopher, but they found no favour in the courts of law. They were frequently reprobated by judges and legal writers; and Lord Mansfield denounced them as being 'against the natural rights of man, and contrary to the common law rights of the land.' Acting upon this view of the impolicy of the system, the decisions of the courts tended rather to confine than to extend the influence of the statute of Elizabeth, and thus the operation of it was limited to market-towns, and to those trades which were actually in existence at the time it was passed. And although, in consequence of this doctrine, many absurd anomalies and inconsistencies were introduced, yet the exclusion of some manufactures, and particularly of the principal ones of Manchester and Birmingham, from the operation of the act, had probably a favourable effect in causing it to be less strictly enforced even against those who were held to be liable to it. It was proved by a mass of extremely interesting evidence produced before a committee of the House of Commons in 1814, that the provisions of the statute of Elizabeth neither were, nor could be, carried into effect in our improved state of trade and manufactures. An alteration in the law could therefore be no longer delayed. And though the question was brought before the legislature on a petition praying that the 5th Eliz. c. 4, might be rendered more effectual, the result was the passing of an act (54 Geo. III. c. 96) by which that statute, so far as it enacts that no person shall exercise any trade without having served a seven years' apprenticeship to it, was wholly repealed. There is in the act of 54 Geo. III. c. 96, a reservation in favour of the customs and bye-laws of the city of London, and of other corporate towns, but in general the necessity of apprenticeship, as a means of access to particular trades, is abolished, and a perfect liberty, in this respect, is established.

Apprenticeship, though no longer absolutely necessary, still continues to be the usual mode of learning a trade, and as such is recognised by law; it may therefore be useful to mention, in a summary manner, some of the leading provisions of the law upon the subject. By the common law, an infant, or person under the age of twenty-one years, being unable to contract any obligation except for his own benefit, cannot bind himself apprentice so as to entitle his master to an action of covenant for departing his service, or other breaches of the indenture. The statute of 5 Eliz. c. 4, s. 42 and 43, enacts that every person bound by indenture according to the statute, although within the age of twenty-one, shall be bound as amply, to every intent, as if he were of full age. But by these words of the statute, the infant is not so bound as that a remedy lies against him upon any covenant of the indenture; and it has therefore been a common practice for a relation or friend to be joined as a contracting party in the indenture, and engaging for the faithful discharge of the agreement. But by the custom of London, an infant, unmarried and above the age of fourteen, may bind himself apprentice to a freeman of London, and it is said that, by force of the custom, the master may have such remedy against him as if he were of full age, and consequently an action of covenant. Any person under the age of twenty-one years is, by 5 Eliz. c. 4, s. 35 and 36, compellable to be bound apprentice, if so required by any householder using half a plough of land in tillage. The same act also provides that the binding must be by

indenture, so that binding by deed-poll, or by an agreement to execute an indenture, or a parol binding, have been held not to constitute an apprenticeship, though, by statute 31 Geo. II. c. 11, a binding by deed not indented will enable a person to gain a settlement.

By statute of 43 Eliz. c. 2, confirmed by 8 and 9 Wm. III. c. 30, and by subsequent acts, the churchwardens and overseers of a parish, with the assent of two justices of the peace, may bind children of paupers apprentices till the age of twenty-one, and not only persons in husbandry and trade, but gentlemen of fortune and clergymen may be compelled to take them. But if such master is dissatisfied, he may appeal to the sessions. Parish apprentices may also be bound (2 and 3 Anne, c. 6) to the sea service; and masters and owners of ships are obliged to take one or more according to the tonnage of the vessel. Various regulations have been made by several acts of parliament, and in particular by 56 Geo. III. c. 139, for ensuring that parish apprentices shall be bound to proper masters, and securing them from ill-treatment. A settlement is gained by apprentices in the parish where they last resided forty days during the service. (13 and 14 Car. II. c. 12.) [See POOR LAW and SETTLEMENT.]

An indenture cannot be assigned over, either by common law or equity, but by custom it may. Thus, by the custom of London and other places it may be done by a 'turn-over.' Parish apprentices may also, (32 Geo. III. c. 57, s. 7.) with the consent of two justices, be assigned over by indenture to the indentures.

An indenture is determinable by the consent of all the parties to it; also by the death of the master, apprenticeship being a personal trust between master and servant. But it is said that the executor may bind the apprentice to another master for the remainder of his term. And if there is any covenant for maintenance, the executor is bound to discharge this as far as he has assets. In the case of a parish apprentice (32 Geo. III. c. 57, s. 1), this obligation only lasts for three months, where the apprentice-fee is not more than 5*l.*, and the indenture is then at an end, unless upon application by the widow or executor, &c. of the master to two justices, the apprentice is ordered to serve such applicant for the remainder of the term. By the custom of London, if the master of an apprentice die, the service must be continued with the widow, if she continue to carry on the trade. In other cases, it is incumbent on the executor to put the apprentice to another master of the same trade. By the Bankrupt's Act, 6 Geo. IV. c. 16, s. 19, it is enacted, that the issuing of a commission against a master shall be a complete discharge of an indenture of apprenticeship; and where an apprentice-fee has been paid to the bankrupt, the commissioners are authorized to order any sum to be paid out of the estate for the use of the apprentice which they may think reasonable.

A master may by law moderately chastise his apprentice for misbehaviour. He cannot, of his own accord, discharge him. But if he have any complaint against him, or the apprentice against his master, on application of either party to the sessions, by 5 Eliz. c. 4, or to two justices in the case of a parish apprentice, by 20 Geo. II. c. 19, and other acts, a power is given to punish or to discharge the apprentice, and in some cases to fine the master. If any apprentice, whose premium does not exceed 10*l.*, run away from his master, he may be compelled (6 Geo. III. c. 25) to serve beyond his term for the time he absented himself, or make suitable satisfaction, or be imprisoned for three months. If he enters another person's service, his master is entitled to his earnings, and he may bring an action against any one who has enticed him away.

In London, in case of misconduct by the master towards the apprentice, or by the apprentice towards the master, either party may summon the other before the chamberlain, who has power to adjudicate between them, and, upon the disobedience or refractory conduct of either party, may commit the offender to Bridewell.

The main objections to apprenticeship are, its interference with the property which every man has or ought to have, in his own labour, and its encroachment not only on the liberty of the workman, but also of those who might be disposed to employ him, and who may safely be allowed to judge whether he is fit to be employed or not. To require in the more common mechanical trades the same length of apprenticeship as in the nicer and more difficult arts, is manifestly unnecessary and inexpedient; and it is obvious that

long apprenticeships have a tendency rather to repress than encourage a love of industry, as an apprentice is excluded from the greatest incentive to voluntary labour, namely, a participation in the fruits of his exertions or skill. Most of these objections apply to apprenticeship as a necessary rather than a voluntary contract, and are of course removed by the present state of the law. At the age at which apprentices are usually bound some subjection to restraint is desirable; and, whether by being bound as an apprentice, or by working as a journeyman, a workman is most likely to gain a complete knowledge of his trade, and to acquire habits of industry, may be left to the determination of those who are practically interested in the question.

APPROACHES, the general term given to the trenches excavated by the besieger, for the purpose of forming roads, by which he may advance from his camp to the foot of the breach made in the walls of a fortress without being exposed to the view of the defenders. These approaches sometimes consist of covering masses only, formed either with earth in bags, with fascines, stuffed gabions, wool-packs, or bales of cotton.

APPROVER. By our antient law, where a person who had been arrested, imprisoned, and indicted for treason or felony, confessed the crime charged in the indictment, and was admitted by the court to reveal on oath the accomplices of his guilt, he was called an *approver*.

The judge or court might in their discretion give judgment and award execution upon the party confessing, or admit him to be an approver. In the latter case a coroner was directed to receive and record the particulars of the approver's disclosure, which was called an *appeal*, and process was thereupon issued to apprehend and try the *appellees*, viz. the persons whom the approver had impeached as the partners of his crime.

As the approver, in revealing his accomplices, rendered himself liable to the punishment due to the crime which he had confessed, and was only respited at the discretion of the court, it was conceived that an accusation, made under such circumstances, was entitled to peculiar credit, and the accomplices were therefore put upon their trial without the intervention of a grand jury.

Here, however, as in other appeals [see **APPEAL**] the parties accused by the approver were allowed to choose the mode of trial, and the approver might be compelled to fight each of his accomplices in succession. But, unlike an appeal by an innocent person, the prosecution, at the suit of an approver might be defeated and discharged by a pardon granted by the king either to the approver or to the appellee.

If the approver failed to make good his appeal, judgment of death was given against him. If he succeeded in convicting the appellee, then he was entitled to a small daily allowance from the time of being admitted approver, and to a pardon from the king.

The appeal by approvers had become obsolete before the abolition of it by parliament; and the present practice is to prefer a bill of indictment against all parties implicated in the charge, and to permit the criminal who confesses his guilt to give evidence against his companions before the grand jury. If upon the trial the demeanour and testimony of the accomplice is satisfactory to the court, he is recommended to the mercy of the crown. (See 2 Hawk. *Crown Law*, ch. 21.)

APPROXIMATION, from the Latin, signifies a *drawing near to*. In mathematics, results are said to be found by approximation, when the process employed gives nearly, but not exactly, the result required.

Strictly speaking, the observed phenomena in every branch of experimental philosophy are approximations, more or less near, to the truth. Thus the distance of the sun, or the diameter of a planet, are only known approximately; but general custom does not sanction the application of the term to any 'drawing near' in which the imperfection arises from error of the senses, or of instruments. It is only when the defects of mathematical analysis oblige us to be content with a formula which gives results only nearly true, that the latter are said to be approximate. To this part of the subject, then, we confine ourselves.

It may be stated as a general fact, that there are very few mathematical processes, except those of pure geometry, which give absolutely correct determinations, in which the answer obtained is neither more nor less than is necessary to satisfy the conditions of the question. But the fault is not in the

processes themselves, but in the problems which it is necessary to submit to them, and in the nature of arithmetical, as distinguished from geometrical, magnitude. It is worth while, briefly, to elucidate this point. In geometry, the mind conceives one line or angle to differ from another by some magnitude of the same kind which can be assigned, and a magnitude is rather imagined to be given, than actually given. If we attempt to *construct* the line or angle of geometry, we must have recourse to approximation, and that of the roughest character, since the errors are as great as those of the senses. It is only by laying down the postulate that any line or angle can be assigned independently of all mechanical methods, that geometry becomes a science of absolute exactness. In arithmetic, on the contrary, the very first notion of numbers throws a theoretical difficulty in the way. We can imagine a line to grow or increase *continuously*: that is, in such a way that it shall not increase from one to two feet, without previously assuming every possible length which lies between one and two feet. This idea is forced upon us whenever we see points moving to or from each other. But is it therefore true, that every possible length which is greater than one foot and less than two, can be expressed by one foot and some determinate numerical fraction of a foot? This question reduces itself to the following. Let AD be

greater than AB (one foot), and less than AC (two feet): if BC be successively divided into two equal parts, three equal parts, four equal parts, and so on, *ad infinitum*, does it follow that some one or other of the subdivisions must of necessity fall upon the point D , previously taken at hazard? If we appealed to the evidence of the senses, we should certainly answer in the affirmative, for, though the finest compasses were used, we should soon find some point of subdivision so near to D , as not to be distinguishable from it by the severest test our senses could apply. But our mechanical points are minute solids, while the mathematical point has neither length, breadth, nor thickness. Conceive the latter, and the affirmative answer does not appear self-evident: for though the continuation of the points of subdivision is unlimited, the number of points which can be taken in the line is also unlimited. But we can demonstrably answer the question in the negative (see the *Society's Treatise on the Study of Mathematics*, p. 81): as an instance, let BD be equal to the side of that square of which BC is the diagonal, or let BC be the circumference of that circle of which BD is the diameter. In neither case can one of the subdivisions of BC ever fall on D .

Here then is a fruitful source of the necessity of having recourse to approximation, since we cannot be sure that any required relation between concrete magnitudes is absolutely expressible in numbers. In fact, we may state the following as a result of experience, though, not so far as we know, capable of demonstration:—numbers being taken at hazard, and submitted to any process which requires the solution of an equation higher than the first degree, the odds are greater than can be assigned against obtaining an absolute result without approximation. In a common table of logarithms, fixing at hazard upon any number, the odds are nearly seventeen thousand to one against choosing a number of which the logarithm can be exactly given.

This would appear to throw an air of uncertainty over almost all the conclusions of pure mathematics, and justly so, ^{80, 81} for we were not for the following truth, which, except so far as the labour of approximation is concerned, renders it practically immaterial whether a result is obtained exactly, or by approximation. Any equation whatsoever, which expresses the condition of a possible problem, if not capable of exact solution, may yet be so far satisfied that a number or fraction can be found, which, on being tried in the given equation, shall produce an error smaller than any we may think it necessary to name at the outset. For instance, the ratio which the circumference of a circle bears to its diameter does not admit of an exact and absolute determination. If any two numbers be named, their ratio is either too great or too small. But supposing it asked to determine the circumference of a circle, from its diameter so nearly, that the error shall not be so much as a foot for every hundred miles of diameter, or in that proportion. It can be shown to be more than sufficient for this purpose to multiply the diameter

by 355 and divide by 113: which, if the diameter were 100 miles, would give 314 miles, 280 yards, and one foot: this, though too small, is within the conditions of the question, not being too small by one foot. Again, though it is impossible exactly to solve the equation $x^2 = 7$ or $x^2 - 7 = 0$, that is, to find a fraction which, multiplied by itself, shall make 7, yet naming any fraction, however small, at pleasure, for example, one millionth or .000001, it is possible so to determine x , that $x^2 - 7$, though not absolutely *nothing*, shall be less than the proposed fraction, one-millionth.

It is not our purpose here to enter upon methods of approximation: no space which we could devote to the subject would suffice to explain any of them with sufficient detail to render them of practical use. We shall therefore content ourselves with giving a general view of one of the great methods, we might say, *the* great method, usually employed, and shall thereby, in succeeding articles, show the young mathematician that various methods, upon which he must have come in the course of his reading, contain a common principle, though disguised under the various forms of calculation which it is necessary to employ in different cases. We must now suppose the reader acquainted with the elements of the differential calculus.

When a number is given, and certain processes are also known, so that they can be performed either exactly or approximately, we are in possession of the solution of the following question—given the number, and the process, to find the result of the process. Hence immediately there results reason for inquiry into the inverse question—knowing the process, and the result of it, what was the number on which the process was employed? The way of finding this number is called the inverse process, and, if of sufficiently frequent occurrence, a name is given to it, and the rule for finding it is put into words, and arranged in its most systematic form. Thus the process of *squaring* or multiplying a number by itself, is known when multiplication is known, and the question is easily answered, what is the square of 24 or any other number, or what *results* from the process of *squaring* employed upon the number 24? From this arise such questions as the following:—The result of *squaring* is found to be 50: what was the number employed? This can only be answered approximately: that is, no number squared can give *exactly* 50, though one can be found, the square of which is as near 50 as we please. This operation occurs sufficiently often to receive the name of the extraction of the square root, and the rule for approximating to it is well known. We can now carry the generalization a step farther, for the result of the last is to put a new process into our hands which we may consider as direct, since the means of performing it in all cases, approximately at least, have been found. We may now ask, what is the result of the process denoted by

$$x^* + \sqrt{x^* - 1},$$

any number being substituted instead of x : but the inverse question—namely, suppose the above process to have been performed, and the result to be 20: what number was employed?—presents itself and requires new investigations. Neither the direct nor inverse process in this case has received a name: and it is evident that, name as many as we may, each addition will give new processes, require new inverse processes, and so on *ad infinitum*.

Previous to entering upon the process of approximation, it is necessary to inquire into the effect which a small change in the number employed would produce upon the result. We say a *small* change, because changes of any magnitude require formulae of great intricacy, compared with small changes. The consideration of the effect of such changes is, among other things, the object of the DIFFERENTIAL CALCULUS; into which we can here enter no further than to state, that in connexion with every process it discovers others, which we shall here call by the names of the *first* derived process, the *second* derived process, &c.; the two first of which are indispensable, the first for obtaining the approximation, the second for ascertaining the degree of accuracy to which the approximation has been carried. These *derived* processes (as we here call them) are the first and second differential coefficients. [See DIFFERENTIAL CALCULUS.]

Let f, x represent the required process or FUNCTION. Let f', x and f'', x represent its first and second derived functions. We suppose this notation known to the reader; but any one who has studied algebra may be prepared to follow us by

reading the first thirteen pages of the Society's treatise, entitled *Elementary Illustrations of the Differential and Integral Calculus*. If the operations which fx indicates to have been performed upon x , be successively performed on a and $a + h$, giving fa and $f(a + h)$, it may be proved that

$$f(a + h) = fa + hf'a + \frac{h^2}{2} f''(a + \theta h) \quad (A),$$

where θ is a fraction less than unity, or θh is less than h . This rule only admits of exception where fx is such that either $f''x$ becomes very large, or $f'x$ very small, for some value of x lying between a and $a + h$; and since in approximations h is a very small quantity, this will rarely happen, and when it does happen, the results of an attempt to approximate will soon point it out. Let us now suppose that we wish to find x in such a way that $fx = 0$. Every case may be easily reduced to this: for example, to solve $x^3 = 7$ is to find or approximate to a value of x , which makes $x^3 - 7 = 0$. The first step is to find by trial some value of x which will very nearly satisfy the proposed condition, that is to find a , so that fa shall be small. No general rule can be given for this part of the process, which is, however, easily done in most cases. To carry an example with us, let us suppose it required to solve the equation

$$x^3 - 2x = 5$$

or to make

$$x^3 - 2x - 5 = 0.$$

Here fx is $x^3 - 2x - 5$, and, by the rules of the differential calculus, $f'x$ is $3x^2 - 2$, and $f''x$ is $6x$. We soon find that there is a root between 2 and 2.1, for if $x = 2$, then $x^3 - 2x$ is 1, and if $x = 2.1$, it is 5.061; the first less than 5, the latter greater, but not much. We therefore take 2.1 as the approximate value of x found by trial.

Returning now to equation (A), let us suppose a the approximate value increased by h , in such a way that $a + h$ shall be the real value of x required, or $f(a + h) = 0$. This gives

$$h = - \frac{fa}{f'a + \frac{1}{2} h f''(a + \theta h)} \quad (B),$$

in which h is not, strictly speaking, determined, because it occurs on the second as well as the first side. But h is small, because a is nearly the value required, and therefore we may approximate to the value of h from (B) by rejecting the small term

$$\frac{1}{2} h f''(a + \theta h)$$

from the denominator of the fraction, which gives

$$h = - \frac{fa}{f'a}$$

for an approximate value of h : so that the new value of x obtained from the step just made is

$$a = \frac{fa}{f'a}.$$

With this new value of x we may recommence the process, and find a new correction; and so on.

Resuming the example, we find putting $a = 2.1$,

$$fa = a^3 - 2a - 5 = .061,$$

$$f'a = 3a^2 - 2 = 11.23,$$

$$h = - \frac{.061}{11.23} = -.0054 \text{ nearly,}$$

$$x = a + h = 2.0946 \text{ nearly.}$$

Trying this value in $x^3 - 2x = 5$, we find it .005, nearly; less than the tenth part of its preceding value. With 2.0946 for a , the process must be now repeated.

The degree of approximation thus obtained may be estimated as follows, though we can only very briefly explain it to those who have no more practice in the differential calculus than we have hitherto supposed. Resuming the correct equation (B), we see that, if we call fa , as obtained, a small quantity of the first order, $(fa)^2$ of the second, and so on, then h will be of the same order as fa , unless $f'a$ be also of that order, which is one of the excepted cases. Hence, in rejecting θh , we reject only quantities of the first order from the term $f''(a + \theta h)$, or of the second from $\frac{1}{2} h f''(a + \theta h)$, or of the third order from the whole fraction, since fa is itself of the first order. This will appear from the develop-

ment of the second side of (B) by common division. Thus rejecting θh , and developing

$$- \frac{fa}{f'a + \frac{1}{2} h f''a}$$

as far as terms of the second order, we have

$$h = - \frac{fa}{f'a} \left(1 - \frac{f''a}{f'a} \frac{h}{2} + \&c. \right),$$

in which, if on the second side we write $-\frac{fa}{f'a}$ for h , which rejects terms of the second order only, we still reject terms of the third order only in the value of h . Hence

$$h = - \frac{fa}{f'a} \left(1 - \frac{1}{2} \frac{f''a}{f'a} \frac{fa}{f'a} \right) \text{ nearly,}$$

and its ratio to its preceding value $-\frac{fa}{f'a}$ is

$$1 - \frac{1}{2} \frac{f''a}{f'a} \frac{fa}{f'a}$$

whence $-\frac{1}{2} \frac{f''a}{f'a} \frac{fa}{f'a}$ represents roughly the greatest part

of itself, by which the correction $\frac{fa}{f'a}$ may be erroneous, the sign indicating whether it is too small or too great. In the preceding example, where $a = 2.1$, and where

$$fa = a^3 - 2a - 5 = .061,$$

$$f'a = 3a^2 - 2 = 11.23,$$

$$f''a = 6a = 12.6,$$

the preceding fraction is roughly $-\frac{1}{32}$, so that the correction .0055 may possibly be one thirty-second of itself too great, or about .0002 too great.

This method does not appear to be of much use for the second approximation; but becomes more powerful at every succeeding step. Whatever number of correct decimal places is obtained at the end of any one of the successive approximations, it is, roughly speaking, doubled by the next; since the second term of the preceding development of h , being

$$\frac{1}{2} \frac{f''a}{f'a} \left(\frac{fa}{f'a} \right)^2,$$

is of the same order as the square of h , or of the same order as

$$\left(\frac{fa}{f'a} \right)^2.$$

In treating the various articles, DIVISION, SQUARE ROOT, &c., EQUATION, we shall show that principles analogous to the preceding have been adopted in the rules for approximating.

Various methods of approximation are found in the Hindoo Algebra; but, as far as we can find, Vieta is the first who generalized the main principle so far as to connect the approximate solution of equations with the particular cases of division and the square root, which were known before. Hutton, in his *History of Algebra*, (see his Tracts,) attributes this extension to Stevinus, but on searching the works of the latter, we cannot find anything which, in our opinion, justifies the assertion. The connexion of the arithmetical rules, in which successive figures are successively found, with the preceding, will not at once be obvious; but our limits oblige us to refer to EQUATION on this point. Newton first applied the theory of derived functions directly to algebraical equations; and the method was further extended by Lagrange.

APRICOT is a well-known fruit, cultivated commonly in this and other European countries. The old English name is *a-pricke*, of which apricot is probably a corruption. Like many other domesticated plants, the native country of the apricot tree is unknown: from the name it bore among the Romans, *Armeniaca*, it would appear to have been a native of Armenia, to which country it is in fact assigned by both Pliny and Columella. It has, however, been represented by M. Reznier, a French writer, that it is rather a native of the Oases of the Desert of Egypt, an opinion that seems to have been formed upon these circumstances: firstly, that the modern Greeks call the apricot *Peribollos*, which is nearly the same as the Arabic name *Berkeh-eh*; secondly, that vast quantities of this fruit are not only dried in the Oases and brought to Egypt, where they are

called *Mish-mish*; and thirdly, that the early period of the year when its blossoms unfold, is indicative of a southern rather than of a northern climate. As to the latter observation, it seems to be completely at variance with facts, for the earliest of trees in leafing are the Tartarian honeysuckle and the sanguine hawthorn, which are both found wild in the coldest parts of Asia. It is, perhaps, impossible to demonstrate, from any published evidence, that it is really found wild in Armenia. The following note with which we have been favoured by Mr. Royle, the distinguished author of *Illustrations of the Botany of the Himalaya Mountains and of Cashmere*, may throw some light on the matter:—"The apricot is frequently found in the hills between the Ganges and the Jumna, apparently wild, as well as the walnut, peach, and pomegranate. The two latter appear to be perfectly wild, at least they are found away from villages and covering the sides of hills; but the latter having been formerly much more populous than they now are, many sites of villages and cultivation are concealed and overgrown with vegetation, so that it is difficult to recognise them. The apricot is so generally planted round villages, that there are few without them, the fruit being eaten fresh and also dried, while a very fine oil is expressed from the kernel. My collectors in visiting Cashmere said the fruit trees there formed a perfect jungle. The dried apricot is brought in considerable quantities from Cashmere into India, and called *Khoot-banee*. I am myself rather inclined to think the Cambul mountains the source of many of our fruit trees, and among others of the apricot."

As a domestic fruit tree in the climate of England, the apricot is a plant of less importance than many others: the early season at which it blossoms causes it to be peculiarly subject to the effect of spring frosts, so that a crop of its fruit is very precarious. It is, however, very much cultivated, and it is therefore necessary that we should say something of its varieties and of the mode of managing it.

Apricots in this country are produced either upon open standard trees, or upon walls with a westerly aspect: an eastern exposure is extremely unfavourable to them, at least on the east side of the island. The fruit produced upon walls is the finest, but that from standards is by far the best flavoured.

Of the kinds that are cultivated upon walls there are only three that are much worth having, namely, the orange for preserving, and the Moorpark and Turkey for the table; several others are to be met with in nurserymen's catalogues, but they are of little importance.

There are only two sorts that deserve notice as open standards, namely, the Breck and the Brussels: the former a small yellowish-brown unspotted kind, the latter a larger compressed variety with rich sanguine blotches on its sunned side. Both these, and particularly the latter, are annually loaded with fruit in almost any situation as far north as Ipswich, but we have not remarked them beyond that limit. For preserving, the purpose to which the apricot is best suited, the fruit thus obtained is far superior to any other, as it combines a moderate degree of acidity with a rich saccharine quality. In the south of Europe there is a sort extensively cultivated for preserving, which is hardly known in Great Britain: the French call it *Alberge*, which is probably a corruption of *Al Berkhach*, the Arabic name of the *Mish-mish* variety, from which it is probable that the *alberge* is not materially different: this sort is too tender for England.

The rules for training the apricot are essentially the same as those for the PEACH. The practice is to arrange the shoots upon the wall in what is called the fan fashion, which is by making them radiate at nearly equal distances from a common centre, which is the point where the scion and stock are united. In order to effect this, the shoots are annually shortened back to the length of from six to eighteen inches, according to their strength, and nailed to the wall at from five to six inches distance from each other. Besides this, the first shoots that are protruded in the spring should be examined in May, and all that are superfluous amputated; the stoutest entirely, the weakest only reduced to the length of an inch or two, when they will often become flowering spurs.

No stocks for apricots should ever be employed except the mussel plum and the common plum for clayey, or loamy, or sandy soil; and the seedling apricot itself for soils that are warm and calcareous. All others, and especially what is called the Brompton stock, are so unsuitable to the constitution of the apricot, as to be short-lived and worthless.

Besides the true apricot, there are occasionally seen in the gardens sorts called black or purple. These are distinct species, one being *Prunus dasycarpa*, and the other *Prunus Shbirica*, neither of which is at all worth the trouble of cultivating: they are small, dark purple, acid fruits, and merely objects of curiosity.

APRIES, an Egyptian king, the son of Psammis, (Herod. ii. 161.) otherwise called Psammuthis; he was the eighth king of the twenty-sixth dynasty, (Eusebius,) or the seventh according to Africanus. His name is also written Ouapures by the Greeks, and he appears in the Hebrew history under the name of Pharaoh Hophra (Jeremiah xlv. 30). Apries succeeded his father B.C. 593, and reigned twenty-five years. Early in his reign (B.C. 583) Jerusalem was plundered by Nebuchadnezzar; after which a great number of the people of Judah took refuge in Egypt, under the conduct of Jehanan, who carried the prophet Jeremiah with him to Tahpanhes, (Daphne,) then the residence of the Egyptian king. Apries, as we learn from Herodotus, made an expedition against Cyprus, and had a naval engagement with the Tyrians. Near the close of his reign he sent an army against the Greeks of Cyrene, which was defeated with great loss. This caused a revolt among the Egyptians, which ended in the dethronement and execution of Apries about B.C. 569, or 568. [See ANAXIS.] He was buried in the tombs near the great temple of Athena at Sais, where his ancestors of the Saite dynasty were interred (Herod. ii. 169).

APRIL, the fourth month of the year, consists of thirty days, which was the number said to be assigned to it by Romulus. Numa Pompilius deprived it of one day, which Julius Cæsar restored, and which it has ever since retained. In the original Alban or Latin Calendar, April held the first station, and then consisted of thirty-six days. (See Putsch, *Lection Antiq. Roman.* tom. i. p. 129; Brady's *Chron. Cæsararia*, p. 67.) Its name is usually considered to have been derived from *aperire*, to open; either from the opening of the buds, or of the bosom of the earth in producing vegetation. The Anglo-Saxons called it *Oster* or *Easter-Monath*. In this month the sun travels through parts of the signs of Aries and Taurus, that is to say, of those parts of the *zodiac* which astronomers designate by those names. The real motion of the sun among the constellations is through parts of Pisces and Aries. [See PRECESSION, ZODIAC.]

APRIL CEREMONIES. The custom of making fools on the first of April is a practice well known in England, France, Sweden, and probably in other countries of Europe; and it is believed to be connected with an immemorial custom among the Hindoos held near the same period in India, toward the end of March, called the Huli Festival, when mirth and festivity reign among the Hindoos of every class, and people are sent upon errands and expeditions which end in disappointment, and raise a laugh at the expense of the person sent. (See *Asiat. Res.* vol. ii. p. 334.)

The origin of this April custom seems unknown every where, though Bellingin, in his *Etymology of French Proverbs*, considers that it may possibly have an allusion to the mockery of our Saviour, about this time, by the Jews; a conjecture which is in some degree paralleled, if not corroborated, by the custom of lifting in the Easter holidays, undoubtedly intended to represent our Saviour's resurrection.

In England, the first of April is usually termed 'All Fools' Day,' and the person imposed upon, an April Fool. In France this person is called a 'Poisson d'Avril,' i. e., a mackerel, or silly fish. In Scotland, 'an April Gowk,' Maurice, *Indian Antiq.* vol. vi. p. 71, speaks of the Huli Festival as the celebration of the period of the vernal equinox.

A' PRIORI and A' POSTERIORI: two logical terms, signifying, literally, "from a thing before," and "from a thing after." They are applied to distinguish between two different methods of reasoning, the first, *à priori*, in which the conclusion is drawn from previous arguments, which render it unnecessary to examine the particulars of the case in point; the second, *à posteriori*, in which the thing to be proved is examined, and made the source out of which the reasoning is drawn. It must be noticed, however, that these are rather terms of common conversation and writing, than of logic, properly so called; so that they are seldom noticed by writers on that science. The use of them is in general very vague, and the consequence of any attempt to define them very strictly would be either to make out *à priori* reasoning to be altogether impossible, or to throw insuper-

able difficulties in the way of finding where it ends and the other begins. In common language, we reason *à priori* when we infer the existence of a God from the general difficulties in the supposition of the existence of what we then call the creation, on any other hypothesis; but we reason *à posteriori* when we infer the same from marks of intelligent contrivance in this particular creation with which we are acquainted.

The term *à priori* is, however, frequently used in a sense which implies "previous to any special examination." As when a sentence begins with "*à priori* we should think, &c. &c." which in most cases will be found to mean nothing more than an expression of the leaning which the speaker found his mind inclined to, when he had only heard the proposition, and before he had investigated it.

All *à priori* reasoning is dubious, to say the least: in but very few cases, if any, are we able to say we know sufficient beforehand to render this sort of argument safe. The whole mass of school learning, the greater part of which was overturned by the inductive philosophy, was based upon *à priori* argument. But though the method is of little effect towards the establishment of truth, it is highly effective in its discovery; indeed, by the very nature of its definition, it must be the guide which points out the probable direction in which the thing sought may be found. Columbus went to look for the continent of America, in consequence of certain convictions of his own, derived from *à priori* reasoning. So far he was right; but had he contented himself with writing a quarto volume to prove the existence of the new continent, by reasons which were only strong enough to make it right to look for more, some less imaginative *à posteriori* reasoner would have been the real discoverer.

APSIDES, a Greek term, used to signify those points of a planet's orbit in which it is moving at right angles to the line drawn to the primary. The opposite points are also those of greatest and least distance from the primary. [See APOGEE and PERIGEE for the moon and sun; APHELION and PERHELION for the earth or a planet.]

APT, a town in France, the capital of an arrondissement in the department of Vaucluse, about nine leagues (twenty two miles) E. of Avignon according to Reichard's *Itinerary*, but considerably more (above thirty miles) by measurement on the best maps. It is a very ancient town, having existed in the days of the Romans, who planted a colony here and gave it the name of Apta Julia. There are some remains of antiquity: the present walls are said to be of Roman origin, but it does not appear to have had an amphitheatre.

Apt is on the south bank of the Caillon or Calavon, (a feeder of the Durance,) and there is a fine bridge of one arch over this stream. It possesses an old cathedral, (for it was a bishopric before the revolution,) in the subterranean chapels of which are several ancient remains. The chief trade of the town is in dried fruits, especially plums. The inhabitants manufacture wax candles, which are in considerable repute, woollen stuffs, hats, and leather: they also spin cotton and silk. The neighbourhood furnishes oiled of excellent quality, and earth for pottery. The population, according to Malte Brun, is 5433. 43° 53' N. lat., 5° 25' E. long.

The arrondissement of Apt contains 500 square miles, and above 52,000 inhabitants.

APTERAL, a term used in architecture with reference more particularly to a mode of arrangement peculiar to the temples of the ancient Greeks and Romans. It is formed from a Greek compound term, signifying 'not having a wing,' or 'without wings;' and in this sense it is applied to a temple having prostyles, or porticoes of columns projecting from its fronts or ends, but of which the columns do not extend laterally, and run along the flanks from one end to the other, so as to make it *peripteral*. [See PERIPTERAL, or PERIPTEROS.] The Panhellenium of Ægina, a plan of which will be found with the article ÆGINA, vol. i, p. 141, is peripteral; but if the outer columns of the fronts, with the ranges along the flanks, were removed, the temple would then be *apteral*, as it would be also amphiprostyle. The parallelogrammic temples of the Romans were for the most part simply apteral prostyles, and their arrangement has been much more followed in modern works than that of the Greek temples, which are, with few exceptions, peripteral. Our modern churches which have porticoes,

though some of them are professedly on the Greek model, are, nevertheless, generally, illustrations of the apteral arrangement, and of these that of St. Paul's in London may be best referred to as an example.

APULEIUS (LUCIUS), a Platonic philosopher. He lived in the second century, and was born at Madaurus in Africa. He studied first at Carthage, then at Athens, and afterwards at Rome, where he acquired the Latin language without the help of a master. He was a man of a curious and inquisitive disposition, especially on religious subjects; and to gratify this curiosity, he travelled extensively, and sought to obtain initiation in the various *mysteries*, as they were called, by which the peculiar tenets of many religious and philosophical sects were veiled. Having spent nearly his whole fortune on these journeys, he returned to Rome, and was admitted as a priest into the service of Osiris. He practised at Rome for some time as an advocate, and then returned to seek his fortune in his native country, Africa. Here he met with distinguished success; but he set himself more at his ease by a prudent marriage, than even by his professional gains. A widow, by name Pudentilla, no longer young nor handsome, had wealth, and wanted a husband. She took a fancy to him; but the marriage involved him in a vexatious lawsuit. The lady's relations set up a plea that he had attacked her heart and money with the weapons of seduction; and they accused him of being a magician before Claudius Maximus, proconsul of Africa. Apuleius made a spirited defence; and his *Apology*, or *Oratio de Magia*, still extant, is a curious and valuable specimen of the literature of the age. The *Golden Ass*, otherwise called the *Metamorphosis*, the best known work of Apuleius, is a running satire on the absurdities of magic, the crimes of the priesthood, the amorous intrigues of debauchees, and the systematic outrages of thieves and robbers. The dikes to the research after the philosopher's stone affected to find authority for their fantastic science laid down, and their hopes of success encouraged, in that work. The episodes are the most valuable portions of the piece: especially that of Psyche. Many persons have taken all that is related in it for true history: St. Augustin himself had his doubts on this head; and did not feel satisfied that Apuleius had designed this book only as a romance. Some of the ancients have spoken contemptuously of this performance. Macrobius notices over the *Golden Ass* and all such romances to the general of nurses and gossips. But whatever may have been his defects, Apuleius was an unwearying student, and has opened many passages with a masterly hand. He wrote numerous works in verse and prose, the greater part of which are lost. They are enumerated in the Dissertation on the *Vita et Scriptis Apuleii*, prefixed by Wower to his edition, and adopted into the Delphin. It is probable that Apuleius wrote some books in Greek as well as in Latin. He also translated Plato's *Phædon*, and the *Arithmetic* of Nicomachus. He wrote treatises *De Republica*, *De Numeris*, and *De Musica*. Fragments from his *Table Questions*, his *Letters to Cerealis*, his *Proverbs*, his *Hermagoras*, and his *Lullia*, are scattered up and down in quotation. Besides his *Golden Ass* and his *Apology*, his work *De Dogmate Platonicis*, containing three treatises, 1. *De Philosophia Naturali*, 2. *De Philosophia Morali*, 3. *De Philosophia Rationali*; his books, *De Deo Socratis*, *De Mundo*, which is a translation from Aristotle, and his *Florida*, have survived. He took to declaiming, and was heard with universal applause. The effect produced by his pleading at Ocea was so great, that the audience burst into a unanimous demand for the honours of citizenship to be conferred on him. The people of Carthage were so delighted with his eloquence, that they perpetuated the remembrance of it by erecting his statue. Several other cities paid him the same compliment. Some of his works have been printed separately, with notes by learned critics. The editions of his works are very numerous: that in most general use is the Delphin, in two volumes, quarto.

The *Golden Ass* has been very frequently translated. The *Biographie Universelle* enumerates six French translations; and four Italian, besides translations into Spanish, German, Flemish, and English. W. Adlington's English translation, first printed in 1566, was reprinted in 1571, 1582, 1596, 1639, and probably later also. The latest and best English translation is by Thos. Taylor, London, 1822, one vol. 8vo. This volume contains also the treatise on the God of Socrates, and other treatises; with a life of Apuleius prefixed.

APULIA, the name of one of the divisions of southern

* Nine leagues and three-quarters of twenty-five to the degree (equal to twenty seven English miles). (*Dict. Geog. de la France*.)

Italy in the time of the Romans. Its limits were on the east and north the Adriatic Sea, on the north-west the river Frento, or perhaps the Tifernus, which divided it from the Frentani, Samnium on the west, Lucania on the south, and Messapia on the south-east. It does not appear that the Romans ever considered the Messapian peninsula, now called Terra d'Otranto, as part of Apulia. In remoter ages, the whole of this part of Italy was known to the Greeks by the name of Iapygia (see Herod. iv. 99.), and was inhabited by the Daunii, the Peucetii or Prædicii, the Messapians, and the Salentini, who were all said to be descendants of Greek or Pelasgic colonies. The original Apulians were probably a tribe of the Opici or Osci. (Niebuhr's *Hist. of Rome*, vol. i.)

According to Strabo (vi. p. 283), the Peucetii extended along the coast from Brundisium to Barium, a distance of about 700 stadia; north of the Peucetii were the Daunii, and then the Apuli, extending to the southern confines of the Frentani. Strabo adds, that in his time the names of Peucetii and Daunii were not in use among the natives, and that it was difficult to fix the antient limits of these people. Roman Apulia, in its extended sense, included the countries of the Apuli, the Daunii, and the Peucetii. The islands of Diomedes, now called Tremiti, belonged also to it. The principal towns of Apulia were Teanum, Luceria, Asculum, Argrippa or Arpi, Sipontum, Salapia, Barium, Egnatia, Canusium, and Venusia, the birth place of Horace. This country suffered greatly during the second Punic war, when some of its towns sided with Hannibal and others with Rome. The whole finally became subject to the Roman sway. After the fall of the western empire the possession of Apulia was long disputed between the Goths, the Byzantine emperors, the Longobards, and the Saracens. The Normans conquered Apulia in the eleventh century, and the Norman kings of Sicily styled themselves dukes of Apulia and princes of Capua. These two names included the whole of their continental dominions. When afterwards the monarchy was divided into two kingdoms, namely, Sicily *ultra pharum*, and Sicily *citra pharum*, the latter vulgarly called the kingdom of Naples, the name of Apulia was definitively limited to one of the four divisions of the continental kingdom, consisting of the Apulia of the Romans and the Messapian peninsula. [See PUGLIA.]

APURE RIVER. [See ORINOCO.]

APURIMAC, a river in South America, which carries off all the waters that descend from the eastern declivity of the Cordilleras, between the 11th and 16th degrees of south lat. Its source is in the high range which extends to the north of *Arequipa*, near the 16th degree of lat., under the parallel of the northern part of the lake of *Titicaca*, to the north-west of that lake, and nearly under the meridian of 72°. At first it runs to the north, but by degrees declines to the north-east, descending in that direction in a transverse valley of the range to the meridian of 71°, where it enters into a longitudinal valley, and suddenly changes its course to the north-west, in which direction it traverses 3° of lat., from the 15th to the 12th. In this space its waters are increased by two tributaries, the *Culecamayo* and the *Vilcamayo*. The former joins it from the west, having gathered, in its course of about 150 miles, the waters of many small rivers, which descend from the western range of the Cordilleras in transverse valleys. The *Vilcamayo* runs to the east of the *Apurimai*, in a longitudinal valley, nearly parallel to it, from 15° to 12°; and is separated from the *Apurimac* by a high range of mountains. This stream runs upwards of 220 miles. Near 12° lat., the *Apurimac* is joined by the *Juaja* or *Xauxa*, the largest and most important of its tributaries, which rises between the 10th and 11th degrees of south lat., on the southern declivity of that chain, from which, on the north, the *Tunguragua* and *Huallagua* descend, and flows down in a longitudinal valley from north to south, till it nearly reaches the 13th degree of lat. Here it changes its course, running to the east; but it soon returns to the 12th degree by two bends of a semi-circular form, afterwards enters the plains, and joins the *Apurimac* under the 12th degree of south lat., after a course of about 300 miles.

After its junction with the *Xauxa*, the *Apurimac* runs through the plains in a north-eastern direction till it meets, in 10° 45' south lat., the *Pangoa*, which brings down all the waters descending from the eastern declivity of the mountain-range skirting the valley of the *Xauxa* on

changed into that of *Tambo*, under which name it unites in 10° 31' with the *Parobeni*, and then takes the name of *Ucayali*. The whole course of the *Apurimac* may amount to nearly 500 miles.

It does not seem that either the *Apurimac* or any of its tributaries is adapted to the transport of commodities. Their rapid course in a stony bed between high rocks, and the shallowness of their waters, render them entirely unfit for navigation. On the contrary, they oppose considerable obstacles to travelling by land, on account of the height and steepness of their rocky banks, and in many places cannot be passed but by bridges made of cords or willow-twigs, after the fashion of wicker-work. Our authorities do not mention any fish in these rivers. The only advantage which is derived from them is the fertilizing of a few low tracts along their banks, by the spreading of their waters.

The valleys through which they flow, though of considerable length, are rather narrow. Near the sources they are mere crevices and ravines, but lower down they widen to an average breadth of two or three miles, which sometimes extends even to five. They are, however, not without cultivation. As the upper parts of the valleys lie between 6000 and 10,000 feet above the level of the sea, no tropical productions can be raised on them, but they produce the grains of Europe, especially wheat and barley, and our fruits, as also great quantity of papas. In the lower parts, especially towards the eastern plains, sugar, cacao, and cotton are raised in great quantity; the first is very abundant in the lower valley of the *Xauxa* and *Apurimac*; and here the gardens are chiefly planted with plantains and pine-apples. Indian corn and yams are cultivated for consumption. The mountains which skirt the valleys afford pasture for numerous herds of cattle.

The country drained by the *Apurimac* and its tributaries is the most important and most populous part of the republic of Peru; it comprehends the three departments of *Junta* or *Tarma*, *Ayacucho* or *Guamanga*, and *Cuzco*. Its superior cultivation is to be attributed not only to its being much more fertile than the countries along the Pacific, but also probably still more to the higher degree of civilization which its inhabitants had attained, under the reign of the Incas, before the discovery of America. It is still mostly inhabited and cultivated by the industrious descendants of the antient Peruvians, and contains many towns of importance, among which we may mention *Tarma*, *Guamanga*, *Uchua*, and *Guamanga*, in the valley of the *Xauxa*, and *Cuzco*, the antient residence of the Peruvian monarchs, in the valley of the *Vilcamayo*. (Alcedo's *Dictionary*, Humboldt's and Maw's *Travels*.)

APUS, (Constellation,) from the Greek *ἄπυς*, without feet, used to signify the bird of Paradise, the *avis Indica* of Linnaeus, which was formerly believed to have no feet. It is a constellation introduced by BAYER, and lies too near the south pole to be visible in our hemisphere. It is surrounded by Octans, Pavo, Triangulum Australe, and Camelion. Its principal stars are designated as follows:

Charact.	No. in Catalogue of		Magnitude.

AQUAFORTIS. [See NITRIC ACID.]

AQUA-REGIA. [See CHLORINE.]

AQUARIUS, (Constellation,) the Water-bearer, one of the twelve zodiacal constellations. Its Greek name is *ὑδροχόος*, the Water-pourer. In the Indian zodiac it is simply a waterjug, the name of which, according to Legend, is Coumbam, and the same in the Arabic: in the Egyptian, it is a male figure holding two urns, from which the water flows. The mythology of the Greeks refers the Water-bearer in different places to the fables of Deucalion, Ganymedes, Aristæus, and Cecrops. Its probable origin, however, whether we place the origin of the zodiac in India or Egypt, is the watery season of the year in which the sun was in this sign. Dupuis, who supports the latter opinion, thinks that Aquarius as well as Capricornus and Pisces refer to the months of the year during which the inundation

of the Nilo took place: Legentil, who advocates the latter, imagines that they represent the rainy season which is absolutely necessary for the growth of the rice-crops.

The constellation Aquarius may be found in the heavens by producing southward a line drawn through the bright stars in the head of Andromeda and the wing of Pegasus. This line passes through the two brightest stars in Aquarius, α and β , situated in the two shoulders. The middle point between these two shoulder stars is on the meridian at 12, 10, 8, and 6 p.m. in the months of August, September, October, and November respectively, at an altitude of about thirty-five degrees.

A distinction must be drawn between the constellation and the sign of the Zodiac (see PRECESSION). The latter is the part of the ecliptic which begins at the horn of the constellation Capricornus and ends in the middle of the body of that of Aquarius, comprising the arc of longitude between 300° and 330° , and forming the sun's path between January 20th and February 20th.

The following are the designations of the various stars in Aquarius. Those in the column marked Flamsteed, &c., which have no parentheses or letter, are as marked by Flamsteed: those inclosed in () were added in Piazzi's catalogue: those in [] were added by Bradley; and the one marked Z by Baron Zach:

AQUATIC ANIMALS. The element in which animals habitually reside, or to which they occasionally resort

for the purpose of procuring food or seeking shelter, is so intimately connected with, and bears so obvious a relation to, not only their manners and economy, but likewise their outward forms and internal structure, that it is not surprising that those who first turned their attention to the study of zoology, and sought to introduce the principles of classification into the animal kingdom, should have been so forcibly struck with its importance, as to have made it the primary basis of their system. 'Animals,' says Aristotle (*Hist. b. i. c. 1*), 'may be distributed into different classes according to their manner of living, their actions, their character, and their parts. . . . Considered according to their manner of living, their actions, and their character, they are divided into terrestrial and aquatic. The aquatic are divided into two classes; the one, as is the case with many fishes, pass their whole life in the water, breathe that element, and find their food in it; nor do they ever leave it: the others obtain their food in the water, and even habitually reside in it, but they do not breathe it; they breathe air, and bring forth their young on dry land. Among these latter some are provided with feet and walk upon dry land, others have wings and fly, and others, like the water-serpent, have no feet. . . . Aquatic animals inhabit seas, lakes, marshes, and rivers.' These principles of classification, in which the habits of animals take precedence of those modifications in their organic conformation which produce these very habits, have long since ceased to be adopted by scientific naturalists; notwithstanding which there is perhaps no inquiry which can engage the attention of the zoologist, more fruitful in extensive views and interesting results, than the consideration of the organic structure of animals in relation to the element in which nature has ordained them to live.

Let us consider, in the first place, those animals which reside entirely in the water, and seek their food and nurture their young in that element. All their organization, even to the most minute circumstance, is rigidly adapted to these purposes. The extremities by which progressive motion is performed in the acts of walking and flying, would be a serious impediment to the movements of animals residing in an element of the same specific gravity as their own bodies: these organs accordingly are either entirely wanting, or are reduced to mere rudiments, which serve indeed to keep the body steady and preserve its equilibrium, but are entirely useless in assisting its progression. Such are the *fins* of fishes, and the *flippers*, as they are called, of cetaceous animals. The real organ of progression in both cases is the body itself, which is prolonged and attenuated towards the tail, compressed on the sides, and provided with extremely powerful muscles, with which, by alternately striking the water on either side, the animal propels itself forward with a force and velocity unexampled in any other class of animated beings. It is upon this principle that we often see a boat urged forwards by means of a single oar in the stern. The great majority of these animals not only reside habitually in the water, and seek their food there, but likewise breathe that element, and are consequently furnished with an appropriate apparatus for extracting the vivifying principle from its general mass. These tribes may reside at any depth of the ocean and for any length of time; they are not under the necessity of coming frequently to the surface for the purpose of breathing, and their organization is modified accordingly. Instead of having the tail broad horizontally, it is broad in a vertical direction, which enables them to turn with astonishing rapidity, and is no impediment, but rather an assistant to their forward movements. But the case is different in the cetaceous tribes: these animals, though residing entirely in the water, breathe air by means of lungs like ordinary quadrupeds, and are consequently obliged to come continually to the surface. For this purpose they are provided with a powerful cartilaginous tail, *flattened horizontally*, by moving which upwards or downwards as the occasion requires, they descend to or ascend from the greatest depths of the ocean with almost incredible speed. Fishes, though capable of proceeding straight forwards, or of turning with great rapidity, are comparatively slow in changing their depths; and if they breathed air, they would frequently be suffocated before they could arrive at the surface, from the vertical position of the tail not being adapted to propel them in a vertical direction. But by a simple change, merely by the direction of the tail being altered from the vertical to the horizontal position, the object of nature is accomplished, and the air-breathing cet-

ceous animals are adapted to all the circumstances of an aquatic life. Another beautiful adaptation is observed in the position of the mammae, for the cetacea, like warm-blooded quadrupeds, suckle their young; these are situated upon the breast, and when the young animal requires to suck, the mother stands, as it were, upright in the water, with her head and shoulders elevated above the surface, supporting herself by means of her flippers or fore-paws. In this position she is enabled to supply her cub with the food which nature has provided, and which she could not have accomplished had the mammae been placed in any other position.

There is another extensive tribe of aquatic animals, which are provided with perfect articulated members, sometimes, indeed, supplied with fringes which convert them into a swimming apparatus, but always adapted to enable the animals to walk or crawl along the bottom. Such is the case with all the crustaceous tribes, the crabs, lobsters, prawns, &c.; and these animals, as is well known, can walk on dry land with the same ease as at the bottom of the ocean. When they swim, it is by means of the tail, which is always constructed for that special purpose, and is large and powerful.

Nor is the modification of structure less striking, when we examine those land animals which breathe air, and resort only occasionally to the water, than when we contemplate the tribes which make it their constant residence. Progressive motion on land and in water are so different, that the organs best adapted to the one sort are exactly the most unsuited for the other. In the one case, the body being much heavier than the surrounding medium, requires to be supported, or raised above the surface of the ground; and as progression is performed by the same organs which serve for supports, it follows that the speed of the animal's course will be proportioned to the length of its extremities: in the other case, the body being already supported by the element in which it floats, the length of the extremities would be only an impediment to the progress of the animal, and consequently they are, in such cases, either entirely wanting, or reduced to a rudimentary form, at least in perfectly aquatic animals. Those which resort indifferently either to the land or water, as they are intermediate in habits, so are they likewise intermediate in structure between these two extremes: and the degree in which their organization is modified, when compared with either of the two types, is exactly proportioned to the difference of their habits and economy. All mammals and reptiles, for instance, which seek their food in *fresh-water* rivers and lakes, partake more of terrestrial than of aquatic habits: the extent of water with which they are conversant is, in this case, very small when compared to the extent of land, and their organization differs but slightly from that of ordinary land animals; their extremities are perfectly developed, and of the ordinary form, the principal difference being that their toes are united by an expanded web or membrane, which gives the paw a broad oar-like form, and thus converts it into a convenient instrument of swimming, at the same time that it scarcely interferes with the most perfect freedom of walking and running on land. Of this nature are the extremities of all the vertebrated terrestrial animals which seek their food in fresh water, the otters, beavers, &c. among mammals; the whole order of Natatores, comprising the ducks, swans, peacocks, gulls, auks, puffins, &c. among the birds; and the crocodiles, alligators, fresh-water tortoises, and frogs, among the reptiles. All these animals are, properly speaking, web-footed, and their aquatic habits are less prominent and powerful than their terrestrial; their organs of motion in fact are but little different from those of common terrestrial animals. In those which frequent the *salt water*, on the contrary, the aquatic habits greatly predominate over the terrestrial: they live less on land than in water, and the structure of their extremities approximates more to that of purely aquatic than of terrestrial animals. Their legs are short and inserted, or, as it were, buried in the common integuments of the body, as far as the elbows and knees respectively, leaving apparent only a short fin-like paw, which is unadapted to terrestrial progression, exactly in proportion to its fitness as an organ of swimming. Their progress on land is consequently slow and difficult, they creep rather than walk, dragging the body along the ground, and leaving a broad mark behind them. Few species possess even this limited power of terrestrial motion; those which do, however, have

the structure of the extremities a little less approximated to the form of fins than the purely oceanic species. The seals and walrus, for instance, have the bones of the paws and feet similar to those of ordinary land quadrupeds, only much shorter and more flattened, and the hind-legs are thrown backwards in the same direction as the tail. Still they are enabled to use the extremities, in a certain degree, for walking or creeping on dry land; but the numerous tribes of cetaceous animals which can execute no kind of motion whatever out of the water, have the bones of the anterior extremities flattened and connected together like the stones of a mosaic pavement, whilst the posterior members are entirely wanting. The same is the case with the sea-tortoises, or, as they are more properly called, turtles, when compared with those which frequent fresh water ponds and rivers; the form of their extremities approximates more nearly to that of fins than of feet, and their aquatic habits consequently predominate over their terrestrial.

Thus it is that the peculiar form of the extremities not only indicates the degree in which an animal is aquatic, but even the nature of the element which it frequents. If it inhabit fresh-water ponds and rivers, its feet are simply webbed between the toes, but in other respects perfectly developed, and its terrestrial habits predominate over its aquatic: if, on the contrary, it inhabit the salt water, its feet are flattened into the form of fins, the hind legs are thrown backwards into the plane of the body, and the aquatic habits greatly predominate over the terrestrial. The first are, properly speaking, *web-footed*, the second *fin-footed*. [See AMPHIBIA.]

AQUATIC PLANTS, in horticulture, are those which are naturally found floating in deep water, and are carefully distinguished by the cultivator from mere marsh plants. The management of them when they are hardy is of the simplest kind, nothing being necessary beyond planting them in boxes with holes in the sides, and sinking them three or four feet below the surface of a pond, so that the boxes lie upon, or among the mud at the bottom.

But for those which demand the protection of the stove or green-house, some additional precautions appear requisite. If left to themselves in such situations, the uniformity of temperature is such as to deprive them in some measure of the repose that they naturally receive from the alternation of seasons; kept constantly in a growing state, their excitability is gradually destroyed, and death ensues as a matter of course. The mode of treating them most successfully may be collected from the following account of their management at Eaton Hall, given in the *Transactions of the Horticultural Society*.

'December, 1826, when the leaves were decayed, I took up the bulbs or tubers out of the stone cisterns in which they had grown for years, and put them into pots according to the size of the tubers, and plunged the pots in water to within an inch of their rims. They remained in this situation in the pine-stove till the plants began to show leaves in the April and May following. They were then planted in cisterns and in glazed earthenware pots in which were the following soils:—in the bottom, four inches of strong clay made solid; above this, six inches of light mellow loam, and at the top, an inch or two of sand to keep the water clear. The cisterns, which are made of Yorkshire flags, are of the following dimensions,—3 feet long, 1 foot 8 inches broad, and 1 foot 4 inches deep. They were placed upon the end flues of pine-pits where the fire enters and escapes, and they were elevated with bricks to within eight and twelve inches of the glass. The glazed pots were from fourteen to eighteen inches in breadth and depth, and were similarly placed, except a few that were plunged in corners of the melon-pits. They were kept constantly full of water, and it frequently was made to run over in order that the water might be kept pure. The temperature of the pits was seldom under 80°, and in sunshine often above 100° of Fahrenheit. No air was admitted at the lights immediately above the plants. As the plants increased in growth, they put out many runners, which were pinched off close to the tubers. When the roots reached the clay, the leaves got very strong, raising themselves on the sides of the cisterns.

'The *Nymphaea cœrulea* and *N. odorata*, under similar treatment, produced abundance of flowers. The first flower of *N. rubra* opened on the 13th of August; on the 15th it was fully expanded, and measured over the disk five inches and a quarter. The same plant produced another

flower in September, somewhat larger, and with nineteen petals; many more buds were formed, but they opened very indifferently towards the end of September; in October the plants began to lose their leaves. When this was accomplished, the tubers were taken out of the cisterns and put into small pots as before stated. The last was done this day (December 11, 1827).

The *Nelumbium speciosum*, in a glazed pot, with similar treatment, plunged in leaves in the same pit, has flowered well and ripened seeds.

Various other methods have been recommended; but they all depend for their success upon keeping in view the principle of periodical rest and rapid growth under a high temperature, with but little air during the season of vegetation.

Some very good practical observations on the management of both hardy and tender aquatics have been given by Mr. Kent, in the 3d volume of the *Horticultural Transactions*, p. 24.

AQUATINTA ENGRAVING. The word *aquatinta* is a compound of two Latin words, *aqua* (water) and *tinctus* (stained), by which is implied that this mode of engraving is an imitation of water-colour or India-ink drawings. The inventor, a German artist named Le Prince, was born at Metz in 1723. His method was to sift the common black resin, when tied up very loosely in a muslin bag, and being shook over the plate, the surface was partly covered with the particles: this method is, in some cases, still adhered to. It was then fixed by a moderate heat sufficient to make the dust adhere without fluxing or becoming an even varnish: he thus formed a granulated surface on the plate, usually called a *ground*, which suffered very little from the action of the diluted acid, yet allowed it to corrode very freely in the small spaces left between the grains of the resin. Mrs. Catherine Prestel, also a German, improved much upon the meagre works of Le Prince, and executed several large works with so much success, that little more was found wanting than a ground that would adhere better to the plate and yield a greater number of impressions; this was effected by dissolving the black resin in the highest rectified spirits of wine (alcohol), and then pouring the mixture over the plate, the quantity of resin determining the coarseness or fineness of the grain. When the plate is large, it is necessary to have a broad and shallow tin pan (with a spout at one corner) in which the plate is laid inclining from the upper edge, so that the superfluous ground may be saved; this must be quickly returned to the bottle, and the plate laid, inclining a little, on a table, so that the ground may run to the lower edge, where it is wiped off from the extreme edge with a cloth. When the ground is quite dry, the surface will be of a bright copper colour, and in a few hours will be ready for use. A warm room is requisite for this operation in cold weather, but if hot, the early morning must be taken. Dust should be most carefully avoided. A small plate may be held on the points of the fingers and thumb of the left hand whilst the ground is laid, and be gently moved about till the ground has granulated or formed; this aids the better formation or crystallization of the grain: before a ground is laid, the plates are to be well cleansed with dry whiting and a dry linen cloth, it being absolutely necessary that the plate should have a very perfect polish, for without this the granulation cannot be well effected. Any of the resinous gums will, with spirits of wine, make a ground, but the black resin is generally preferred. As the proportions cannot be given, it is usual to have a bottle in which the ground is much too strong for use, and to make it read in another by mixing a little of the strong ground with sufficient spirits of wine. The modern aquatinters have another advantage over their predecessors in using a composition for painting the forms of leaves of trees, or other objects, where the trouble of surrounding the forms by a varnish would be too great. This composition is made of moist sugar or treacle added to the same bulk of whiting, and ground well on a slab with a little water: a very small proportion of gum Arabic or gamboge may be added. When this composition is used, it must be thoroughly dry before the varnish is passed over it; the varnish also must be allowed time to dry, after which, cold water poured on the plate will in a few minutes bring off all the composition and the varnish which had passed over it, leaving the forms perfect and the ground in those places free to receive the acid again—the remainder of the plate being permanently

stopped out by the varnish: this varnish is either Canada balsam or turpentine varnish mixed with a little lamp-black and spirits of turpentine; with this also the margin of the plate is to be varnished, leaving a narrow strip of the ground for trials. These trials are made, after each time that the acid has been on the plate, by taking off a small portion of the strip with spirits of turpentine, cleaning the place well, and then rubbing in with the finger a little powdered white lead; this process will give a good idea of the actual and comparative strength of tints. It is only by these trials that the aquatinter knows what he is doing, for the acid varies so greatly with the weather, that what might be considered very weak in a cool morning, becomes very strong towards the evening; for this and other obvious reasons, if the room be kept at an equal temperature, the work will advance with much greater certainty than when it varies by the changes of weather. The design intended to be engraved is then made on the ground; this is done in the following manner: The design is first copied on very thin transparent paper, called tracing-paper; between this tracing and the prepared ground on the plate a thin sheet of paper is placed, which has been rubbed over with lamp-black, or vermilion, and sweet oil; every line of the design is then gone over with an instrument called a blunt point, with a moderate pressure, and is thus transferred to the ground so securely that the acid cannot destroy it.

Before the acid is poured on the plate, a border or wall of wax, about an inch in depth, is placed round the margin of the plate. The bordering wax is made by melting together one pound of burgundy pitch, half a pound of bees' wax, and a wine glass full of sweet oil; when melted, to be poured into cold water and worked into small cakes. When wanted, these cakes are put into lukewarm water and made into small rolls like a sausage, then flattened, and one of the edges being a little melted at the fire, is to be pressed close to the plate with a wet finger, making a spout at one corner: this should be well performed, or the acid will get beneath it and do much mischief. In order to make the wax adhere, the plate should be made as warm as the hand of the operator.

The plate being so far made ready, the completion of the design is resumed by stopping out the highest lights on the edges of clouds, water, &c., with a mixture of Canada balsam or turpentine varnish, and the perfectly impalpable oxide of bismuth (bismuth is preferred on account of its weight): these are mixed with a spatula on a slab, and used with a small sable brush, diluting the varnish occasionally with spirits of turpentine. Next pour on the acid, which has been prepared by mixing one-sixth of a pint of the strongest acid to five-sixths of a pint of water: let it remain, according to its strength, from half a minute to a minute, then pour it off, and wash the plate three or four times with clean water, and dry it with a clean linen cloth or a pair of bellows: the last is the best, if the stopping-out varnish should not be perfectly hard. If on trying the strip the tint is found not to be sufficient, repeat the acid for another half minute, and then proceed. The colour of the bismuth varnish must be changed for the second stopping out, by adding a little chromic yellow, vermilion, or lamp-black, or any other colour that is not destroyed by the acid. The colour is to be changed after each application of the acid, that the engraver may remember in what places he has carried forward his work, what tints have been softened at their edges, &c.

It is impossible to give a scale of times for each employment of the acid, but the following may serve as a guide. If the first tint has half a minute, the second may take three-quarters, the third one minute, the fifth one minute and three quarters, the sixth two minutes and a half, the seventh five minutes, the eighth twelve minutes, &c. The acid should be strengthened a very little after each application; and it may be so equally done that the above proportions will serve very well as a general rule, depending on the strength of the tints required. When the ground changes to a grey colour it is beginning to fail, and must be taken off by heating the plate till the bordering wax will lift off: after this, sweet oil is applied to the whole surface, and a brisk heat beneath the plate will bring off all the different varnishes with a linen cloth; then an oil rubber, made of fine woollen cloth, rolled up hard and the end cut off, applied with sweet oil, will take out the stains: tints which are too strong may be softened or even rubbed out. Perhaps it

need not be added, that a single grain of sand or any other hard substance under the rubber will ruin the whole work. Gradations in skies, &c. are sometimes made in this manner, though more generally by pouring the acid on slowly, beginning at the darkest corner. It will frequently happen that some portions of the varnishes will become so hard, that the common method will not stir them; in this case a little of the oil of spike lavender applied with the finger is quite certain to produce the effect. The plate is now cleaned with spirits of turpentine and sent to the printer to prove, after which it is to be exceedingly well cleaned with turpentine, &c., and another ground laid; this should be done in such a manner as to make the grains fall exactly on the granulations of the former ground, which is called *re-biting*. It is done by making the ground much stronger than was used before. Fortunately, the liquid ground has a natural tendency to granulate upon the same places as before, and when the acid is again applied it will act in the same interstices as before, and only wants a little care to make it answer. The process for the second ground is the same as for the first; re-touching with the acid those tints which require more depth, and stopping out those parts that are sufficiently dark. Another proof must be taken, and the plate then finished with the burnisher, which some use with oil, but others prefer it dry, previously filling the whole plate with powdered white lead, by which it can be seen how much has been burnished down, according to the quantity of colour left in the plate.

It is to be regretted that aquatinta engraving has suffered much odium from the facility with which inferior plates can be produced; but it is capable of the greatest beauties, as may be seen in the justly-celebrated plates to the *Hunchback*, by W. Daniell, Esq. R. A.; Mr. Ostervald's work *On Sicily*; and many others.

AQUA TOFANA, a poisonous fluid invented about the middle of the seventeenth century by an Italian woman of the name of Tofana. This woman, who resided first at Palermo, and afterwards at Naples, was one of the most celebrated of a class of persons known under the name of Secret Poisoners [see POISONING, SECRET], who in ancient times were believed to possess the power of destroying life at any stated period, from a few hours to a year; and who, during the sixteenth and seventeenth centuries, were regarded in all the nations of Europe with extraordinary terror. In the year 1659, during the pontificate of Alexander VII., it was observed at Rome that many young married women became widows, and that many husbands, suspected to be not agreeable to their wives, died suddenly. The government used great vigilance to detect the poisoners, suspicion at length fell on a society of young wives, whose president appeared to be an old woman, who pretended to foretell future events, and who had often predicted very exactly the death of many persons. By means of a crafty female their practices were detected; the whole society were arrested and put to the torture, and the old woman, whose name was Spara, together with four others, were publicly executed. It appears that Spara, who was a Sicilian, derived her art from Tofana at Palermo, the latter selling the poison, which from hence acquired the name of 'Aqua della Tofana,' in small glass phials with this inscription, 'Manna of St. Nicholas of Barri,' and ornamented with the image of the saint. Though this infamous woman lived to an advanced age, she was at length dragged from a monastery, in which she had taken refuge, and put to the torture. She confessed that she had been instrumental to the death of no less than 600 persons. The dose of her poison was from four to six drops; yet though, in this state of concentration, its nature could not be detected, it was subsequently discovered to consist of a solution of arsenic; but so little was that age acquainted with the art of chemical analysis, that they had no means of detecting a solution of arsenic so highly concentrated that from four to six drops was a mortal dose, whereas, at present, even when arsenic has been dissolved in the stomach and mixed with vegetable and animal fluids, it may be reduced to its metallic form, and made to exhibit all the physical properties of the metal to the naked eye, with as great distinctness as in any quantity, however large, when only the twentieth part of a grain has been procured. Modern chemistry, therefore, has deprived the poisoner of all chance of escape by concealing or disguising the poison he administers.

AQUEDUCT, or **AQUEDUCT** (*aquæ ductus*), as it was formerly more correctly written, is composed of two

Latin words, *aqua*, in the genitive case *aquæ*, and *ductus*, signifying together, a conductor or conduit of water. In this, its more extended sense, the term aqueduct may be applied to all sorts of pipes and channels for the conveyance of water, but it is commonly restricted in its application to constructions of a somewhat peculiar description, which have been formed above the surface of the ground for the purpose of conveying streams of water in a regularly, but slightly descending current across valleys and over plains, from one comparatively high point to another. The canal or conduit called the New River, by which water is brought into London from a distant source, is strictly an aqueduct, but it is not what is generally understood by the term, in any part of its length. Indeed we have not in this country an example of the sort of structure which the term designates, though it may be exemplified by some of the canal and railway ducts in the north of England and in Scotland, such as Barton Bridge, in Lancashire, which carries the Duke of Bridgewater's canal over the river Irwell; the bridge which carries the Edinburgh and Glasgow Union Canal over the valley of the water of Leith at Slateford; and the Sankey viaduct in the line of the Liverpool and Manchester railway. The former of these have been sometimes called aqueducts, but this application of the term only leads to confusion, unless *bridge* be superadded; structures for the purpose of carrying a canal are indeed more strictly viaducts than aqueducts. Nevertheless, such is the form and structure of an aqueduct,—a series of piers equidistant, or nearly so, with arches connecting their heads to form one continuous and nearly level line, on the back of which is the channel or water-course.

We do not read of any aqueducts, properly so called, till the Roman period, yet contrivances for the conveyance of water from a distant source for the supply of a city are of great antiquity. Herodotus (iii. 60) describes the mode in which Eupalinus, an architect of Megara, supplied the city of Samos with water. A hill 900 Greek feet high was pierced by a tunnel seven stadia, or 4200 feet long. The tunnel was eight feet high and eight feet wide, and in it there was cut a channel thirty feet deep (if the text is correct) and three feet wide, through which the water was conveyed in pipes (*ὄχετινόμενον ὑπὸ σολήνων*) from a large source to the city. In translating the word *σολήν* (*solēn*) by the usual term 'pipe,' we do not mean either to assert or deny that pipes, properly speaking, of wood or metal were used on this occasion: the word may here signify merely channel stones.

Aqueducts were most extensively used by the Romans, and on the sites or in the vicinities of many of their more important cities in Asia and Africa, as well as in Europe,—in Greece, Gaul, and Spain, as in Italy and Sicily—parts remain, even to the present day, of extensive constructions of the kind. That of Segovia, for instance, in Old Castile, erected in the time of Trajan, is a magnificent work. The neighbourhood of the city of Rome itself is pre-eminently distinguished by a long series of these almost imperishable memorials of her ancient magnificence.

The aqueducts of the Romans were built, for the most part, of brick, and consisted, as we have said, of nearly square piers running up to the same height,—the necessary fall of the course being considered—and connected by semi-circular arches, over which the conduit ran. This conduit had a paved or tiled floor, and was inclosed laterally by walls of brick or stone, and covered with a transverse arch, or by a simple flat coping of stone. This species of conduit frequently involved a serious difficulty, for if the source of the water conveyed were much higher than the place at which it was to be delivered, and the distance too short to reduce the flow of water to a proper velocity, the stream had to be carried in a winding direction to expend the height in a greater length. Otherwise, the pressure of water from the head would burst or blow up the covering arch or coping of the aqueduct, render the work useless, and inundate the country over which it was attempted to carry it.

Some idea may be formed of the extent and importance of the Roman works of this kind when it is stated, that Rome was supplied with water from sources varying from thirty to sixty miles in distance, and that at one period of its history no less than twenty aqueducts brought as many different streams of water across the wide plain or Campagna in which the city stands. Great portions of the distance were

of course in every case occupied by artificial channels winding along the sides of hills and mountains; and long tunnels carried the streams through these natural barriers when occasion required, but nevertheless the arcaded duct led the streams across the deep valleys, and the aqueduct was in every case required to carry it onwards from the hills over the wide plain to the doors of the eternal city. These metropolitan aqueducts were of various lengths, according to the direction in which they came, but in one of them the series of arches is calculated at nearly 7000, their height being in many places more than a hundred feet. There is nothing more interesting or more really beautiful in the existing ruins of ancient Rome than the remains of these splendid works, which radiate, in almost every direction, and run across the almost level plain out of which its hills arise in long arcaded series, whose simplicity and unbroken continuity produce a degree of grandeur unmatched by the more laboured and more pretending works within the walls.

Sextus Julius Frontinus, who was inspector of the aqueducts of Rome under the Emperor Nerva, has left a treatise on this subject, which contains much curious information. [See FRONTINUS.] Some of the more remarkable aqueducts will be noticed under the names of the cities to which they belong, or the individuals whose name they bear. The modes in use, both in ancient and modern times, for distributing water through a large city when brought to the great reservoirs will be noticed under the head of WATER and WATER-PIPER.

Modern Rome is abundantly supplied with water by three of the ancient aqueducts, which have undergone repairs and restorations: the most important was made by that great papal reformer, Sixtus V., from whose conventual name of brother Felix (Fra Felice) one of the streams so delivered is called the *Acqua Felice*.

Aqueducts have been constructed in modern times, and of these the most celebrated are that of Caserta in the kingdom of Naples, of Maintenon near Versailles in France, and that of Bemfica, called *Aguaa livres*, near Lisbon in Portugal.

AQUIBA, עֲקִיבָה, or Akibah ben Joseph, called by Epiphanius and Hieronymus Barakiba, lived at the end of the first and at the beginning of the second century A.D., and was president of the academy at Lydda and Tabae, as disciple and successor of rabbi Gamaliel, and one of the most famous doctors of the Mishnah. The Jews assert that things which were unknown to Moses were revealed unto Akibah. According to Joehia, the greatest part of the Mishnah originated from the verbal and written instructions of Akibah. According to Zakat, the whole of the Mishnah came from Akibah, who lived 120 years. When he was forty years of age he fell in love with the daughter of Kalba Shwa, in whose service he lived as herdsman. She promised to marry him if he became a rabbi. Akibah studied forty years with great zeal, and had 24,000 disciples, among whom was Rabbi Jose, the author of the Great Jewish Chronicles. He joined the pseudo-Messias, Bar Coheba (Coziba), who raised disturbances in Judea. The Emperor Hadrian, in whose time the insurrection took place, after taking Bitter or Bethara, put many Jews to death, and ordered Akibah to be killed by iron combs, with which his skin was taken off. Akibah was buried in Tiberias, where his tomb was annually visited by his admirers between Easter and Pentecost. The book *Jezirah* (עֵצֶרֶת), which some ascribe to

Adam, and others attribute to Akibah, is the chief book of cabalistic doctrines. The two last editions of this famous book are by Rittangel, with a Latin translation and commentary, Amst. 1642, 4; and lately, by Friderich von Meyer at Frankfurt on the Main, with a German translation, 1832, 4to.

AQUILA (the Eagle), a constellation situated above, so as to rest on, Capricornus and Aquarius. It may be readily found by means of the head of Draco and the bright star α Lyrae, since a line passing between β and γ Draconis, and through α Lyrae, passes through a bright star of the first magnitude, α Aquilæ, cutting also two stars of the third magnitude, β and γ , situated directly above and below α . This constellation is on the meridian at 8 o'clock P.M. in the middle of September, at about 40° of elevation. Its principal stars are here given, as in preceding constellations. The number inclosed in a parenthesis is that of Piazzi.

In the Greek mythology this constellation represents the eagle of Jupiter. According to some, it is the bird which was the tormentor of Prometheus. M. Dupuis conjectures, but with very little probability, that the name was given when Aquila was near the summer solstice, and that the bird of highest flight was chosen to express the greatest elevation of the sun.

The constellation Antinous is usually considered as a part of Aquila, and is treated as such in catalogues. It is represented as a boy in the grasp of the eagle, and its principal stars are η , θ , ι , κ , and λ , in the above catalogue. It is said to have been placed in the heavens by the order of the Emperor Hadrian, in memory of a favourite of that name, who is generally supposed to have perished in the Nile, A.D. 131. Others have supposed it to refer to the fabulous history of Ganymede, who was carried to heaven by the eagle of Jupiter; but this is rendered unlikely by the silence of Ptolemy, who, though he speaks of the group of stars in question, does not call them the constellation Antinous, but simply 'unformed stars, among which is Antinous.' Had the two figures originally contained any reference to the mythology above alluded to, it is most probable that the constellation would have been regularly distinguished long before the time of Ptolemy.

AQUILA, a considerable town in the kingdom of Naples, and the chief place of the province called Abruzzo Ultra Primò. It is situated six miles south of the ruins of Amiternum, a town of the Vestini, and the birth-place of the historian Salustius, where remains of an amphitheatre and other buildings are still seen near the village of San Vittorino. Remains of another town, called Forconium, an episcopal see in the early Christian ages, and which was ruined by the Longobards, are found about four miles south of Aquila, near a place called Bagno. The origin of Aquila appears to have been in the twelfth century, when the inhabitants of various ruined towns in that neighbourhood thought of uniting and building a place of defence against the incursions of foreign and domestic depredators, so common in that age. Frederic II., emperor and king of Sicily, is, however, considered as the real founder of Aquila, having given it a diploma or charter, assigning to the new city a territory which comprehended the two districts of Amiternum and Forconium. The name of Aquila is said to have been first given by him in honour of the emblem of the imperial eagle. He wished to make the new town a bulwark of his kingdom on the frontier of the papal states. In 1254 the episcopal see of Forconium was transferred to Aquila. This city became populous and powerful, and acted a conspicuous part in all the wars that followed the first French invasion of the kingdom under Charles of Anjou. It generally took part with the popes and the Angevins against the Aragonese.

After Charles V. had taken possession of Naples, the French, under General Lautrec, having invaded the kingdom, took possession of Aquila; the imperial army, however, retook it soon after, and the prince of Orange, who

commanded in the name of Charles, irritated by the disaffection of its inhabitants, laid enormous contributions on them, in order to pay which all the plate and the treasures of the churches were taken. Numbers of the citizens were imprisoned, and many outrages committed by the soldiers on the inhabitants. This occurred in 1529. The plague, which broke out soon after, completed the desolation of the city, which never after recovered its former prosperity. It was long considered the first city in the whole kingdom next to Naples, and it could muster 15,000 armed men at the sound of the alarm-bell. Charles V. built the castle, which is situated in the highest part of the city, and was considered very strong at the time. Aquila is on the slope of a hill, at the foot of which the river Aterno or Pescara flows. It commands the view of a fine valley about sixteen miles in length, watered by numerous springs, and productive in corn, fruit trees, flax, and especially saffron. The hills are covered with vineyards, and the lofty Apennines, which rise behind on both sides, afford pasture in summer to numerous herds of cattle and flocks of sheep. The chain to the north-east of Aquila is overtopped by Monte Corno, and that to the south-west by the mounts called Della Duchessa, which divide the valley of the Aterno from that of the Salto, a branch of the Velino. [See ABRUZZO.] Aquila has manufactures of linens, paper, leather, and woollen cloths: its comfits or sweetmeats have a great reputation. Its population, according to the Italian itineraries of 1830, is 13,000. The walls are above three miles in extent, but a great portion of the enclosed space is now occupied by gardens. It had once twelve gates, eight of which have been blocked up. Aquila has declined, while Chieti, Lanciano, Teramo, and other towns of Abruzzo, have increased.

The province of Aquila, which once occupied the largest part of Abruzzo, has been of late years divided into two *intendenze* or divisions, the chief towns of which are Aquila and Teramo. Aquila is the residence of the intendente, and also of a military commandant: the civil and criminal courts for its division are held here. It has also a lyceum. The streets, though generally narrow, are straight, and it has two squares ornamented with fountains. The palace of justice, or town house, and the episcopal palace and cathedral, are its principal buildings. It reckoned once above one hundred churches, and numerous monasteries, besides twelve nunneries: many of the churches, however, had fallen to ruin already in the last century. Others have been since suppressed.

Aquila is the residence of many families of the provincial nobility. Its inhabitants speak Italian, like their neighbours of the Roman state, and not dialect, as the rest of the kingdom. It lies in $42^{\circ} 20' N.$ lat., $13^{\circ} 28' E.$ long., 106 miles N.N.W. of Naples, and 57 N.E. of Rome. There is a post road from Aquila to Sulmona, 32 miles distant, and from thence to Naples. A mountain road leads from Aquila over the pass of Antroloco to Rieti in Sabina, and from thence to Rome. (Bernardino Cirillo, *Annali della Città dell' Aquila*.)

AQUILA, Ἀκίλα, אַקִילוס, was, according to Epiphanius, *De Ponderibus et Mensuris*, cap. 15, a relative of the emperor Hadrian, and converted from idolatry to Christianity, but afterwards excommunicated on account of his idolatrous astrology. He embraced Judaism, was circumcised, and translated the *Old Testament* literally into Greek (Iren. iii. 24; Euseb. *Demonst. Evang.* vii. 1; Hieronymus, *ep. ad Pamphilum*, Opp. ed. Mart. t. iv. p. ii. p. 255). Aquila adhered so strictly to the Hebrew text that he translated בְּרֵאשִׁית *ἐν ἀρχαῖς*, יְצָהָר *συνεπρόσθετος*, אֵת *σὺν*, אֲשֶׁר *ἀνέρις*. The word עֶלְמָה Jer. vii., he translated *ναῖς* and מִשִּׁיחַ anointed, or the Messiah, Ps. ii. *ἡλεμμένος*, and consequently the Jews preferred his translation to the Septuagint. It appears also from Irenæus, iii. 24, that the Ebionites used the translation of Aquila in order to support their Judaizing tenets. The remains of this translation have been edited by Montfaucon, Martianay, and others, in the *Hexapla* of Origen. [See HEXAPLA.] *Dathe de Aquila Reliquiis Interpretationis Hoseæ in Opusculis Dathii* ed. Rosenmüller, Lips. 1746, 8. Schleusner, *Opuscula Critica ad versiones Græcæ Vet. Test. pertinentia*, Lips. 1812, 8; Capelli, *Critica Sacra*, ed. Scharfensberg, l. v. c. 3. t. ii. p. 805. The translator אַקִילוס, in the Talmud of Jerusalem, is called in the Talmud of Babylon אַנְקִלוֹס, Onkelos. [See ONKELOS.]

AQUILE'GIA, literally the *Watergatherer*, because the leaves collect water in their hollow, is a small genus of plants, commonly called *Columbines*, belonging to the crow-foot tribe, of which several species are cultivated in gardens. They are known from aconitum, to which they are the most nearly related, by the leaves of the calyx being all of the same form and size, and by the petals having each a long curved horn or spur at the base. All the species are handsome perennials, easily propagated by dividing the crown of their roots: the commonest, hence named *A. vulgaris*, is found in woods and thickets in this and all other parts of Europe; it has produced many varieties, differing in the colour of the flowers, and in the multiplication of the petals, for the sake of which it is commonly cultivated. The other species are found either in the north of Asia, or in North America. They are all acrid plants, but so much inferior in virulence to aconite, that no attention has been paid to their qualities.

AQUILEIA, a town of the antient Veneti, whose origin is lost in the obscurity of the ante-Roman ages, was made a Roman colony in the year 181 B.C., and became the first city in the Venetia, and the bulwark of Italy on the side of Illyricum and Pannonia. It was built near the right or western bank of the river Sontius, now Isonzo, in a low and fertile plain, watered by numerous rivers. It was a place of great trade, for, although several miles distant from the coast of the Adriatic, vessels could reach it through canals which communicated with the rivers Natissa and Anfora, which flow near it. Its walls were twelve miles in extent, and the city was adorned with an amphitheatre and other splendid buildings. The Via Æmilia, a continuation of the Flaminian road from Rome, led through Ariminum and Bononia to Aquileia. Augustus, Tiberius, and other emperors occasionally resided in this city. The poet Cornelius Gallus was born here. Aquileia distinguished itself for its fidelity to Rome. When the Thracian Maximinus, after the death of Alexander Severus, was proclaimed emperor by the legions of Pannonia, and afterwards outlawed by the Roman senate, he marched against Italy to avenge himself. The citizens of Aquileia boldly opposed his passage, and sustained a siege, during which the women vied with the men in the defence of the town. The soldiers of Maximinus, disheartened by this unexpected resistance, and the delay thereby occasioned to their intended march upon Rome, revolted and killed Maximinus and his son, A.D. 241. The Roman senate, relieved of its fears, voted thanks to the Aquileians.

Aquileia, from its situation, was exposed to the first attacks of Alaric and the other barbarians who successively invaded Italy from the north-east. The famous Attila at last stormed it, after an obstinate defence, pillaged, and destroyed it by fire, after butchering the greater part of its inhabitants, in the year 452. Some of those who escaped took refuge in the neighbouring island of Grado, where they built a town of that name, and where the bishops of Aquileia resided for a time. It was about the same epoch that many fugitives from various towns destroyed by Attila escaped to the islets in the lagoons, where afterwards Venice was built. In the year 489, Theodoric and his Goths defeated in the plains of Aquileia Odoacer, king of Italy. Aquileia was afterwards restored by Narses, the general of Justinian, but it never recovered its former splendour. The see of Aquileia was one of the oldest in Italy; its first recorded bishop, Hermagoras, is said to have lived under the Emperor Nero. There is also a tradition that St. Mark the evangelist was the first bishop of Aquileia, and that he wrote there his Gospel, a MS. of which, pretended to be an autograph of the saint, was transferred to Venice in the fourteenth century, and deposited in the treasure-room of the church of St. Mark. During the first three centuries the chronology of the bishops of Aquileia exhibits several chasms, but from the beginning of the fourth the records of that see proceed without interruption. Towards the end of the same century it was made a metropolitan see, about the same time as Milan. Its jurisdiction extended first over Istria, and lastly over the whole of Venetia, and even as far as Como, and beyond the Alps, to the river Save, having twenty-seven bishops under it. Rufinus, the translator of Origenes, and who carried on a bitter controversy with St. Jerome, was a priest of the church of Aquileia. In the sixth century a schism arose between the see of Aquileia and that of Rome, which continued for two centuries, during which we find often two bishops for the same see, one orthodox at Grado, and the other schismatic at Aquileia. It was then that the

metropolitans of Aquileia assumed the title of patriarchs, which was used in the Greek Church, and had been adopted by the Goths and other Arians. When the Longobards invaded Italy under their king Alboin, the patriarch of Aquileia removed to Grado with the treasures of the church. In the subsequent wars between the Longobards and the Greeks, and afterwards the Franks, many families emigrated from Aquileia to Venice. Charlemagne and his successors bestowed privileges on the see of Aquileia, which had already become reconciled with that of Rome; and Otho II. gave it the castle of Udine and other estates in the March of Frioul (Forum Julii); and Conrad II. and his successor Henry III. enlarged still more the dominions of the see, giving it almost the whole of Frioul and Istria, so as to render the patriarch a sovereign prince, and a great feudatory of the empire, with power of coining money, raising troops, &c. Rome had acknowledged his title of patriarch, which was a singularity in the western church. Pope John XIX. qualified the see of Aquileia as 'being second in rank to that of Rome, and above all other episcopal sees in Italy.' Pope, who was patriarch about that time, restored the walls of Aquileia, and built a magnificent temple, with a lofty tower, which he dedicated to the Virgin Mary, making provision for fifty priests to officiate in it. This was to Aquileia a period of revived prosperity. But the wars between Frederic II. and the popes, and the factions of the Guelphs and Ghibelins, came again to disturb the country; and these, added to the growing unhealthiness of Aquileia, occasioned by the stagnant waters around, induced the patriarchs, in the thirteenth century, to remove their residence to the castle of Udine, which town then rose on the decline of that of Aquileia. From that time Aquileia became desolate, and by degrees dwindled away to a mere unhealthy village. The patriarchs, however, continued to govern the country of Frioul as independent princes, and to exercise their spiritual jurisdiction over the numerous dioceses subject to them. They were frequently at variance with their neighbours, the Venetians, the Paduans, the dukes of Carinthia, the counts of Gorizia, and the dukes of Austria, and sometimes with their own subjects. At last, in 1420, the Venetians conquered Frioul, and Udine submitted to them. Thus ended the temporal dominion of the patriarchs. Their spiritual authority they retained to a much later period, until the year 1758, when, in consequence of disputes having arisen between the Venetian senate and the court of Austria about the right of nomination to the vacant see, the patriarchate was finally abolished, with the consent of the pope, and its diocese divided into two episcopal sees, Udine and Gorizia. The province of Frioul continued under the Venetians until the fall of that republic in 1797. Aquileia, or rather its remains, form now part of the circle of Istria, in the government of Trieste, in the Austrian monarchy, being just outside the frontiers of the Lombardo-Venetian kingdom, the Italian boundary being two or three miles to the west of Aquileia. The road from Venice to Trieste passes through Palmanova, about eight miles north of Aquileia. (Johannes Candidus, *Commentariorum Aquilejensium*, libri viii.: De Rubels, *Monumenta Ecclesie Aquilejensis*.)

AQUINAS, THOMAS, that is, Thomas of Aquino, in Naples. This famous theologian was of very distinguished birth, being a younger son of Landulf, count of Aquino, and Lord of Loretto and Beccastro, who was nephew of the Emperor Frederic I., the celebrated Barbarossa. He was born in 1227, some authorities state in the town of Aquino, others in the castle of Rocca Secca, the seat of his family, near the monastery of Monte Casino. Having been sent at five years of age to the neighbouring monastery to receive the rudiments of his education, he remained there till he was nearly thirteen, when he proceeded to the university of Naples, which had been founded in 1230 by his relation, the Emperor Frederic II., grandson of Barbarossa, and had already acquired great reputation. From his earliest years he had shown a love of study, and the circumstances of the time were, in various respects, such as naturally tended to encourage the preference which he was thus led to form for a literary, or at least a meditative, life. His native country was distracted by civil dissensions, in which if he was to mix, the trade of arms alone offered him any chance of distinction. On the other hand, a fervent excitement had been recently awakened among all classes by what were then esteemed learning and philosophy, which, puerile and misdirected as their spirit might to some extent be, at least afforded an intellectual exercise, and therefore ad-

vanced the world a most material step in civilization. About 1217, the order of preaching friars called after his name had been founded by St. Dominic; and of this body, already in the enjoyment of vast popularity, the young nobleman proposed to become a member. On his earnest entreaties the superior of their convent at Naples was prevailed upon to admit him as a novice. He was at this time in his fifteenth year, and the important step upon which he had ventured was taken without the knowledge of his parents. As soon as they heard of what he had done, his mother hastened to Naples in the hope of inducing her son to change his resolution. On finding that, to avoid her, he had taken flight for Rome, she proceeded after him to that city, but there learned that he was already on the road to Paris. He was, however, apprehended on his way by the exertions of his two elder brothers, who then held commands in the army of the emperor in Tuscany, and brought back to Rocca Secca. But no entreaties or other inducements could prevail upon him to give up his determination: and at length, after about a year had elapsed, the friars got both the emperor and the pope, Innocent IV., to interfere in the case, and by their command Aquinas was permitted to return to his convent. With the view, probably, of effectually preventing all further attempts to withdraw him from his chosen vocation, he soon after (in 1243) made profession, and then went to Cologne to attend the theological and philosophical lectures delivered by Albertus Magnus in the Dominican convent there. Here, from his silence, which, however, was not that of stupidity, but of meditation, he is said to have been named by his fellow-students the Dumb Ox. His teacher, however, detected the genius that was wrapped up under this taciturnity, and remarked, that if that ox should once begin to bellow, the world would be filled with the noise. After remaining a few years at Cologne, he accompanied Albert on a visit to Paris, from which they returned together in 1248. Aquinas was then ordained a priest. He returned to Paris in 1253. Soon after this he published the first work by which he distinguished himself as a writer, a treatise in defence of the monastic life, in answer to a doctor of the Sorbonne, who had attacked the privileges of the new mendicant orders. He afterwards defended his positions in a debate with his opponent, in the presence of Pope Alexander IV. This, and some other exploits of a similar kind, acquired him the highest reputation in what was then deemed the chief of intellectual feats—the dexterous use of the weapons of the Aristotelian metaphysics and logic. In 1255 Aquinas received from the University of Paris his degree of doctor in theology; and he afterwards spent several years in that city, lecturing publicly with immense applause. In 1272, however, he returned to Italy, and for two years taught theology at Naples. Pope Gregory X. having then requested his presence at the general council which had been summoned to meet at Lyons, with the object of effecting a union between the eastern and western churches, he prepared to set out for that city, but first paid a visit to his niece, Frances of Aquino, the wife of the Count Amibal de Creciano. Having arrived at their residence, the castle of Magenza, he was there suddenly attacked by fever, on which he desired to be removed to the neighbouring Cistercian monastery of Fossi-Novu, in the diocese of Terracina: and here he expired on the 7th of March, 1274, in the forty-eighth year of his age.

The honours paid to Thomas Aquinas, both during his life and after his death, comprise nearly all the highest distinctions by which men have ever testified their admiration of intellectual eminence. Popes, kings, emperors, learned bodies, and great cities, contended for his presence during his life; and as soon as he had ceased to live, the order to which he belonged, the monks of the abbey in which he died, and the University of Paris, of which he had been an alumnus and a graduate, disputed the right to the possession of his body. It was not till nearly a century afterwards that this latter controversy was terminated by the removal of his remains on the 28th of January, 1369, to the Dominican convent of Toulouse, where a magnificent tomb erected over them still remains. Before this he had been canonized by Pope John XXII. by a bull dated the 18th of July, 1323. Pope Pius V. also declared him a doctor of the church in 1567.

The piety and moral virtues of St. Thomas Aquinas have received the warmest commendations from his contemporaries. His religious sincerity and fervour appear to have been accompanied by unaffected humility, and also by a

mildness of temper that has not always been the grace of eminent theologians. The popularity of his writings was formerly so great that there have been at least five or six editions of the complete collection. The best edition is considered to be that printed at Rome, in 1570, in seventeen volumes, folio. Various of his treatises have also been repeatedly printed separately. Of the whole the most famous is his *Summa Theologiæ*, which is still a favourite authority in the Catholic church. His *Commentary on the Four Books of Peter Lombard* (called the Master of Sentences) is another performance that was long in high esteem. He has also left Commentaries on several of the writings of Aristotle, which, however, he perhaps only knew in Latin translations made from the Arabic. A good many of the works that have been attributed to Aquinas are now admitted to be spurious; and doubts have even been entertained as to whether the '*Summa Theologiæ*' be really his. Of the theological opinions which he maintained, the most memorable is his assertion of the supreme and irresistible efficacy of divine grace. This doctrine was afterwards opposed by Duns Scotus; and it formed for ages a matter of violent controversy between the *Thomists* and the *Scotists*, as the followers of the two doctors called themselves. The writings of Aquinas are not likely to be very fairly appreciated in the present day; but though we had no other evidence than the recorded admiration which he excited in his own times, it would be impossible to doubt his extraordinary genius. His talents, too, appear to have been as various as they were powerful. He wrote in verse as well as in prose; and some of the Latin hymns still used in the service of the Romish church are of his composition. He seems also to have been celebrated for his ready and pointed repartees. One which has been preserved is, his reply to Pope Innocent IV. when that pontiff, on some money being brought in one day when they were together, remarked, 'You see that the age of the church is past when she could say, Silver or gold have I none; - 'Yes, holy father,' answered Aquinas, 'and the day is also past when she could say to the paralytic, Take up thy bed and walk.' There are other stories of the absence of mind which he sometimes showed in company when absorbed in some of his profound speculations. One day, while dining with Louis IX., king of France (St. Louis), he suddenly, after a long silence, struck the table with violence, and called out, 'A decisive argument! the Manichæans could never answer it!' Reminded of where he was by the prior of the Dominicans, who was also present, he asked pardon of the king; when his majesty expressed himself only anxious to get hold of the unanswerable argument against the Manichæans, and, calling in a secretary, had it taken down immediately. Rabelais alludes to another anecdote of this kind. (See *Pantagruel*, liv. iii. chap. 2, and the note of Duchat on the passage.) The titles of Aquinas, in the list of the scholastic doctors, are, the Angelic Doctor, and the Angel of the Schools. (See a few remarks on Aquinas in the notes to the translation of Richard de Burg's *Philobiblon*. Lond. 1832.)

AQUINO, an antient but long since decayed town in the province of Campania or Terra di Lavoro, in the kingdom of Naples. It was a Roman colony, and a large and populous city in the time of Strabo: the Via Latina passed through it. Juvenal, the Roman satirist, was born at, or in the neighbourhood of, Aquinum. Pescennius Niger, one of the competitors for the empire after the death of Pertinax, was also a native of this place. Aquinum suffered greatly by the various invasions of the barbarians after the fall of the empire. It was at last utterly destroyed during the wars of Conrad and Manfred against the Popes, after the death of Frederic II. of Suabia. The chroniclers of the following centuries speak of it as a place in ruins, and containing but a few hundred inhabitants. It retained, however, its bishop's see and the feudal title of county. The famous St. Thomas was the son of a count of Aquino, and was born at Rocca Secca in the neighbourhood. At present Aquino contains hardly a thousand inhabitants; the ground is covered with ruins of buildings of various ages and styles, among which are the remains of a theatre and of an amphitheatre, and a lofty wall of square stones united without cement, which formed part of a magnificent Doric temple. Several columns about four feet in diameter lie prostrate around, as well as a large portion of the frieze with triglyphs and part of the cornice. From a hasty measurement taken by Sir R. C. Hoare, this temple appears to have been 190 feet in length, and above 60 in breadth. An old ruinous church, which is still called Il Vescovato, (although the see has been long

since transferred to Pontecorvo, where the bishop resides,) is built on the site, and partly with the materials, of another antient temple. Adjoining it is a triumphal arch of a mixed style, Corinthian and Ionic; a copious stream now flows between the arch, and, after supplying a neighbouring mill, runs to join the Liris. A native of the place, the nephew of the Canonico Bianchi, has collected copies of all the inscriptions which are found at Aquino and in the neighbourhood. Aquino lies six miles west of the town of San Germano, the antient Casinum, in a plain between the rivers Melfa and Liris, bounded on the north-east by the mountain on which the monastery of Monte Casino is built. The air of Aquino is unwholesome; the village of Palazzuolo, three miles distant, enjoys a better air. [See MONTE CASINO.]

AQUITANIA, one of the great divisions of antient Gaul. The limits of Aquitania are stated by Cæsar to have been the river Garumna, the Pyrenees, and the Ocean. The Garumna divided it from Celtic Gaul. The original Aquitanians are supposed to have been of Iberian race, distinct from the Celts. Cæsar did not go into Aquitania, but his lieutenant, the younger Crassus, made an incursion into it. The country, however, was not finally subjugated until the year 28 B.C., when Augustus sent Marcus Valerius Messala to conquer it. The poet Tibullus accompanied Messala in this expedition, which he has commemorated in his poems. In the division of Gaul into Roman provinces as settled by Augustus, the limits of Aquitania were extended northwards as far as the river Ligeris (the modern Loire), and eastwards to the Mount Cebenna, which formed the limits of the Narbonensis province. By this extension, Aquitania was made to include several large districts or tribes of Celtic Gaul, such as the Santones, Pictones or Pictavi, Bituriges, Arverni, Lemovices, &c. In the following subdivisions of Gaul under the later emperors, we find the Aquitania of Augustus divided into three provinces, viz., the Novempopulana, which comprised the greater part of the original Aquitania, between the Garumna, the Pyrenees, and the Ocean; its principal towns were Climberris, afterwards Augusta, Beneharnum, Iluro, Aquæ Tarbellæ: the Aquitania prima bordering on the Ligeris, and whose capital was Avaricum, afterwards called Bituriges (now Bourges), and the Aquitania secunda, situated between the other two, and whose principal city was Burdegala (Bordeaux). Under the reign of Honorius, the Visigoths, after ravaging Italy, passed into Gaul and took possession of Aquitania; which they kept till Clovis, king of the Franks, defeated them in a great battle near Poitiers A.D. 507, and killed their king Alaric II. Aquitania then became part of the monarchy of the Franks; but under the weak successors of Clovis it was detached from it again, and given as an apanage to Charibert, a younger son of Clotarius II. We find in the beginning of the eighth century, Eudes, duke of Aquitania, and a descendant of Charibert, at war with Charles Martel. The Saracens from Spain having invaded the country and pillaged Bordeaux, Eudes was glad to make his peace with Charles and to join him against the Mohammedans, who were utterly defeated by Charles between Tours and Poitiers A.D. 732. In 768, Waifer, Eudes' successor, was attacked by Pepin, who conquered the whole of Aquitania and reunited it to the French monarchy. But Aquitania had undergone another change in its southern limits. The Vascones, a Spanish people, finding themselves hard pressed by the Visigoths, crossed the Pyrenees and settled in the southern part of Aquitania, which from them took the name of Vasconia or Gascony, which it has retained ever since, whilst the more northern parts of the same province continued to be called Aquitaine, and afterwards by corruption, Guienne. The Vascones were conquered by Pepin and Charlemagne, but revolted again, and formed an independent state, having their dukes, until the eleventh century, when they became united to the duchy of Aquitaine, which, under the successors of Charlemagne, had become one of the great fiefs of the French monarchy, and virtually independent of the crown. Eleanor, the heiress of William, last count of Poitou and duke of Aquitaine, married Louis VII., king of France, but being repudiated by him, she next married Henry, duke of Normandy, afterwards Henry II. of England, who thus became possessed of Guienne, Poitou, Gascony, Anjou, in short, of the whole Aquitania in its most extended sense. This was the origin of long wars between the two kingdoms. At last Charles VII. conquered Guienne and the other districts above-mentioned, and took Bordeaux in 1451-2, and reunited the whole to France. The name of Guienne continued after-

wards to be used as that of one of the provinces of the old monarchy, though restricted to a very small portion of the former Aquitania, until the revolution, when the whole country was divided into departments, and the old denominations became obliterated.

ARA (the Altar), a southern constellation, not visible in our latitude. It is situated near *Lupus*, above *Pavo* and *Triangulum Australe*, in such manner that the Centaur appears to be placing the Wolf upon the Altar. One mythological account explains it as the altar upon which Chiron sacrificed a wolf; another, as an altar constructed by Vulcan, upon which the gods swore fidelity to each other during the war against the Titans.

ARA. (*Macrocephalus*, VIELLOT.) [See MACAW.]

ARABESQUE. This term is applied to an heterogeneous species of ornament, or mode of enrichment on flat surfaces employed in works of architecture principally. The name is intended to mean simply 'in the Arabian manner,' and is a French form of that expression. The mode of enrichment which it refers to, was practised in the decoration of their structures by the Moors, Saracens, or Arabians of Spain, for they were called by all those names by their Christian but less civilized neighbours, and from them particularly the species of ornament to which it belongs was so designated. As far as the Mohammedan conquerors of Spain were concerned, they appear to have borrowed the idea from the hieroglyphical enrichments of the monuments of Egypt. The dogmas of their religious code, however, forbidding the representation of animals, in order to avoid the very semblance of idolatry, they employed plants and trees in a similar manner, and with stalks, stems, tendrils, foliage, flowers, and fruit, produced an endless variety of forms and combinations, with which they painted and sculptured the surfaces of their buildings. Hence fanciful combinations of natural objects to form the continuous ornament of a flat surface came to be called Arabesque, though it differed so widely from the Arabian or Mohammedan compositions as to be filled with representations of animals of every variety, and with combinations of plants and animals, as well as combinations of animal forms almost equally discordant with nature. The name, indeed, has become so general as to be applied to the fanciful enrichments found on the walls in the ruins of Herculaneum and Pompeii, as well as to others of the same and earlier date, which were formed and forgotten long before the sons of Ishmael learned to draw. The most celebrated Arabesques of modern times are those with which Raphael ornamented the piers and pilasters of the arched gallery of the palace of the Vatican, which bears his name. This gallery, or these galleries rather, for it is in three lengths, are always distinguished as Raphael's galleries ('Le Logge di Raffaello'), because of the Arabesques and of the illustrations of the Bible history in the ceilings, though, indeed, but one of the three sides exhibits the designs of the great artist himself.

The term Arabesque is more applied to painted than to sculptured ornament, though it is not restricted to the former; but Arabesque ornament in sculpture, if not kept very low in relief, is apt to become grotesque, as is the case with many or most of the sculptured enrichments of our pointed architecture.

ARABIA. It is intended in the present article to offer a sketch of the prominent natural features of Arabia, and a brief survey of the history, state of cultivation, language, and literature of its inhabitants. Further information concerning particular points connected with each of these departments, will be found by turning to the separate articles, such as MECCA, KORAN, MOHAMMED, ABULFEDA, &c.

The entire surface of Arabia is calculated to be about

four times that of France. It is considered as pertaining to Asia, though, from its position and physical character, it would appear rather to belong to Africa. If the Red Sea did not interpose a narrow interruption, one almost continuous tract of sandy deserts would extend from the shores of the Atlantic to the Persian Gulf.

Arabia presents the form of a vast peninsula, connected with the south-western extremity of the continent of Asia by an isthmus of sandy deserts, the breadth of which, from the northern end of the Gulf of Akaba to the mouth of the Shatt-el-Arab (the Euphrates) in the Persian Gulf, may be estimated at about 800 English miles. It is situated between 12° and 30° N. lat., 32° and 59° E. long., partly within, and partly to the north of the tropical region: the tropic of Cancer divides it into two nearly equal parts. It is bounded on the N. by Syria and the Euphrates, on the E. by the Persian Gulf; the Indian Ocean (called here the Arabian Sea and the Sea of Oman) washes the long extent of its south-eastern coast; the straits of Bab-el-Mandeb and the Red Sea form the western boundary. Cape Rasalgate or Ras-al-Had is the most eastern projection of the peninsula; cape Mussendom (cape Maketa of the ancients) extends in a north easterly direction towards the straits of Ormuz; cape Aden, near the south-west angle of the peninsula, is discovered between fifteen and twenty leagues off at sea, as a steep and lofty rock; Bab-el-Mandeb, or the Gate of Tears, the dangerous passage from the Indian into the Red Sea, is the point of the peninsula which is situated farthest to the south-west; and cape Mohammed marks the projection of the Sinai mountains between the Gulfs of Suez and Akaba, the two northern branches or gulfs of the Red Sea.

The name Arabia, by which the Greeks introduced this vast country to the knowledge of Europeans, is derived from the name which has for ages been used by the inhabitants themselves. The word *arab*, as a collective noun in the singular, is used as the common name of the Arabic nation; its plural, *arāb*, is restricted to signify the wanderers, nomadic tribes of the Arabs of the desert. Belād-el-Arab (*i.e.* the land of the Arabs), and Jezirat el-Arab (*i.e.* the peninsula of the Arabs), are the usual native designations of the country: besides these, we may also notice the Persian appellation of Arabistan, by which name Arabia is often called among the Persians and Turks.

The derivation of the word Arab is doubtful. Pocock has adopted the notion of several oriental writers, that the country and its inhabitants were so named from Araba, a district in Yemen, to which Ya'rab, the son of Kahlan, the father of the ancient Arabs, gave his name. But the real existence of an individual referred to by the name of Ya'rab, like that of several others of the primeval forefathers mentioned in the ancient genealogies of the Arabs, appears to us subject to the same historical doubts, as that of many of the reputed founders of states in ancient Greece. The very form of the name Ya'rab shows a peculiarity, observable also in other names that occur in the early genealogies of the Arabian tribes, which, in our opinion, characterizes it as a verbal derivative, formed at a subsequent period, in allusion to a former event, the remembrance of which might be preserved by tradition. We are inclined to trace the word *Arab* to the same verbal root, from which this name Ya'rab is evidently derived, namely to the Hebrew verb *arab*, 'to set or go down (as the sun).' According to this etymology, the name Arab implies 'the nation or country situated towards sunset,' *i.e.* westward from the Euphrates, and from the regions which were probably the earliest seats of the Semitic tribes. In support of this derivation, it may not be irrelevant here to observe, that in the Old as well as in the New Testament, by the names Arabia and Arabs, only small territories or isolated tribes in the northern part of what we now call Arabia appear to be meant. (See, *e.g.* Jerem. lxxv. 21; Ezek. xxvii. 21; Galat. i. 17.) Others have deduced the name Arab from the Hebrew substantive *arābah*, 'a barren place or desert,' which, in several passages of the earliest parts of the Old Testament, is used as the designation of the dreary region east of the Jordan and the Dead Sea, and as far south as the Ælantic Gulf.

Greek and Roman Christian writers have confounded the Arabian tribes from Mecca to the Euphrates under the name of the Saracens, the import of which term, as appears from its etymology, (*shark*, in Arabic, 'the East,' *sharki*, 'Eastern,') is 'Eastern Nations.' We do not hesitate to adopt this interpretation, notwithstanding the passage of

Ptolemy (pointed out by Gibbon), who expressly mentions the western and southern position of the Saracens.

The name of Arabia, in its proper acceptation, comprehends the peninsula as far as the isthmus, which runs from the northern extremity of the Gulf of Akaba to the mouth of the Shatt-el-Arab. In a more extensive sense it is made to comprehend also a large tract north of the isthmus, reaching as far as the river Euphrates on the east, and the south-eastern angle of the Mediterranean on the west.

Some of the ancients have extended the limits of Arabia considerably to the north of the isthmus just defined. Pliny (*Nat. Hist.* v. 24) makes Arabia comprehend part of Mesopotamia, nearly as far as the frontiers of Armenia. Xenophon, in his personal narrative of the march of Cyrus the Younger [see ANABASIS], considers the sandy tract along the left bank of the Euphrates, and south of the tributary river Araxes (the Khabour), as part of Arabia; and the physical features of the country, of which he gives the following lively description, will, perhaps, justify him in assigning this tract to the division of Arabia. Having crossed the Araxes, Cyrus 'marched along through Arabia, having the Euphrates on his right for five days' journeys through the desert, a distance of thirty five parasangs. In this region the soil was a plain, perfectly level like the sea, but full of absinthium: whatever else there was to be seen of brushwood or reed, was all fragrant like spices; yet no tree was found. There also was a variety of animals, among which wild asses were the most numerous, and not a small quantity of ostriches: there were also ibstards and gazelles.

The whole peninsula of Arabia, as far as it is at present explored, consists of an elevated table land, declining on the north towards the Syrian desert, and encircled along the sea coast with a belt of flat sandy ground. The flat country, beginning at Suez and extending round the whole peninsula to the mouth of the Shatt-el Arab, is called Gaur or Tehâma, *i. e.* the 'Low-land,' from which the mountainous region in the interior is distinguished by the appellation of Jahal, 'the Hills,' or Nejd, the 'High-land.' The width of the Tehâma varies: near Mokha its breadth is about one day's journey, near Hodeida and Loheia about twice as much. On the eastern coast, in the province of Oman, from Ras-al Had up to Cape Mussendou, it is much narrower: between the villages of Sib and Sohar, indeed, its width extends to about a day's journey: but in the remaining part of the country, the hills reach almost to the sea.

The soil of the Tehâma, from its regular inclination towards the sea, as well as from the large beds of salt and marine exuvie with which it is interspersed, appears to have been once a part of the bed of the sea. It is observed that the sea on the western coast still continues to recede: the reefs of madrepore and coral which abound in the Arabian Gulf, and in some parts rise ten fathoms above the sea, are increasing and coming nearer the shore; and as the intermediate space is gradually filled up with sand, the Tehâma is on that side constantly extending its limits. Muza is mentioned by Arrian (*Periplus of the Erythraean Sea*, c. 5) as a sea-port of Arabia Felix; we now find it at a distance of several miles from the sea. The harbour of Jidda is described by Lord Valentia as being formed by innumerable reefs of coral, which extend to about four miles from the shore, leaving many narrow channels between, in which there is a good bottom at from six to twelve fathoms, and where the sea is perfectly smooth even when it blows the heaviest gale. In the southern part of the Arabian Gulf these banks of coral are less numerous.

The low-land of Arabia is occasionally for many years entirely destitute of rain; but sometimes it is scantily watered by the falling of slight showers during the months of March and April. The dews in the most arid tracts are said to be copious. The high-land has its regular rainy season, which begins about the middle of June, and continues till the end of September. Springs also abound in the loftier mountains, which, when fed by the copious annual rains, send streams of water through the valleys that descend towards the Tehâma: some of them are lost before they leave the mountainous region; others, which are more abundant, rush into the Tehâma, where the fertility of the soil mainly depends on irrigation. Most of the larger streams, as soon as they enter the burning plains, spread out into shallow lakes, and are lost in the sand; only a few reach the sea. These temporary currents of rain-water and the small verdant valleys, but a few feet below the general level, which intersect the arid Tehâma, consti-

tute an important and characteristic feature in the aspect of the country: they are called *wâdis*, an expression which we frequently meet with, though variously written, as a component part of the names of rivers generally, on the maps of other countries also into which Arabian settlers have penetrated. The adopted Greek word *oasis* or *anasis* appears to be the same as *wâdi*. The Wadi Zebid and Wadi Meitan are the two principal torrents in the territory of Yemen: the former reaches the sea near the town of Zebid on the Arabian Gulf; the latter, taking a southerly course, pours its waters into the Indian Sea. In the province of Oman, the rivers Masora and Wadi Sib contain water throughout the year, and both reach the Indian Sea. Arabia is entirely destitute of navigable rivers.

In the Tehâma, the heat during summer, owing to the want of rain, and the almost direct action of a tropical sun, is intense. Niebuhr states, that during his residence in the low-land of Yemen, in the month of August, the thermometer rose to 98° Fahrenheit, and at Loheia, during the month of January to 86; at Sana, in the high-land, it only reached 85° during the summer, and Niebuhr heard it asserted, that, in the latter district, it sometimes freezes. At Muscat, the thermometer varies, according to Frazer, from 92° to 102° of Fahrenheit during summer. Niebuhr was struck with the delightful scenery of the coffee-mountains near Beit-el-Fakih, where he found the air much fresher and cooler than in the parched plains of the Tehâma: yet he had then scarcely reached half the ascent to Kusma to the summit of the range of hills, which here forms the boundary between the Nejd and the Tehâma. The inhabitants of Yemen, he observes, are dwelling, as it were, in different zones: and within the limit of a comparatively small territory may be found a variety of indigenous species of the animal and vegetable kingdoms, such as in other countries can only be seen when brought together by man from distant regions.

The poisonous blasts known by the names of *sami*, *samum*, or *samiel*, seldom blow in the southern parts of Arabia. They are chiefly experienced in the tract between Basra, Bagdad, Haleb, and Mecca; but even here they are only dreaded during the hottest months of the year. These winds seem to derive their noxious qualities from passing over the great sandy desert when scorched by the intense rays of the tropical sun: and accordingly, Niebuhr was informed that at Mecca the samum blows from the east, at Bagdad from the west, and at Basra from the north-west. The nature of winds generally seems to differ according to the tract which they have passed over. Ali Bey observes that, at Jidda, 'the north-wind, traversing the deserts, arrives in such a state of dryness, that the skin is parched, paper cracks as if it were in the mouth of an oven, and the air is always loaded with sand. If the wind changes to the south, everything is in the opposite extreme: the air is damp, everything that you handle feels of a clammy wetness, and the atmosphere appears to be loaded with a sort of fog.' Lord Valentia remarks, that the southern part of the Arabian Gulf, as far as the island of Jebel-Teir, opposite Loheia, is, during eight months of the year, exposed to the S.W. monsoon, which, as it blows over the arid sands of Africa, renders the climate of the adjacent coast extremely sultry. From Jebel Teir to Jidda the winds are variable. Above Cosseir as far as Suez, the wind blows for rather more than eight months from the N.W.

Arabia has long been celebrated for the abundance of its odoriferous plants. The frankincense of Saba is alluded to by the Hebrew prophets (Isaiah lx. 6; Jeremiah vi. 20). Herodotus (iii. 107) mentions frankincense, myrrh, cassia, cinnamon, and ladanum, as productions exclusively peculiar to Arabia, though his information on the products of Arabia is neither extensive nor exact. Among the Romans also, Arabian odours seem to have been quite proverbial. (Propert. ii. 22.)

The coffee-shrub is cultivated chiefly on the western descent of the chain of hills which, in the province of Yemen, separates the level country from the high land: that grown at Bulgosa near Beit-el-Fakih, and exported from Mokha, still maintains its superiority over the coffee produced in the European colonies in all other parts of the globe. The firinaceous deposit called manna, familiar to all readers from the use made of it by the Israelites during their wanderings in the desert, is now, according to Niebuhr, chiefly, if not exclusively, found on the leaves of a species of oak called *ballôt* or *afs*: according to others, it is a pellucid substance

exuded by the leaves of different kinds of trees, chiefly the *helysarum alhagi* of Linnaeus. Grapes are cultivated in several parts of Arabia, though in the Koran wine is forbidden to the Mussulmans. In Yemen, where some pains are bestowed upon agriculture, Niebuhr saw excellent wheat, Turkey corn, or maize, durra, barley, beans, lentils, tobacco, &c.; senna and the cotton-tree are also cultivated here. Much indigo is grown about Zebid. Niebuhr says that he saw no oats in Arabia: the horses are fed on barley, and the asses on beans. The time of the harvest varies. At Muscat, wheat and barley are sown in December and reaped in March; in the high-land, near Sana, the time of the harvest for barley is about the middle of July.

Arabia is rich in indigenous trees; the *acacia vera*, from which the gum Arabic is obtained, the date-tree, and many varieties of the palm and fig tree deserve to be particularly noticed. Forests appear to be rare. In the barren tracts of the country, the Beduins sometimes supply the deficiency of fuel by the dried dung of the camel.

Among the ancients, Arabia was celebrated for its wealth in precious metals; yet, according to the accounts of modern travellers, Arabia possesses at present no mines either of gold or silver. Iron mines are noticed by Niebuhr as existing in the territory of Saada. The lead mines of Oman are, according to him, very productive, and large quantities of lead are exported from Muscat.

On the sands of Arabia and Syria, the camel, the ship of the desert as it is emphatically called by the natives, is an invaluable treasure. Like the Beduins themselves, it learns from early youth to endure hunger, thirst, and fatigue. It performs journeys of 300 to 400 hours without requiring to drink oftener than once in eight or ten days. The herbage scantily supplied by the desert is sufficient for its food. It carries a weight of a thousand pounds and upwards, without being unloaded for weeks. A hint from its leader directs its motions; a song renews its strength. Its hair is manufactured into cloth for garments and tents; its milk, like that of the cow, is nutritious and sweet; its flesh, when young, is in taste similar to veal.

Arabia is noted for its horses, of which there are two distinct breeds. The one, which is called *kadishi*, i. e. of unknown descent, is in no higher estimation than the common horses in Europe; horses of this breed are employed to carry loads, or as draught-animals. The other, called *koheli* or *kohlani*, i. e. of ancient and noble pedigree, is reserved for riding only. The best horses are bred in the desert bordering on Syria: they are here educated in the encampments of the Beduins with a careful tenderness which trains them to habits of attachment to their masters. It is for this quality, and for their amazing speed, that they are valued, more than for their size or beauty.

There is also in Arabia a spirited kind of ass, which is used for riding and for military service: the best are to be found in the province of Lahsa. The Arabian oxen and cows are distinguished by a hump over the shoulders. Herodotus (iii. 113) mentions two kinds of sheep with fat tails as being indigenous in Arabia. The rock-goat, the fox, the musk-deer, and a wild species of ass inhabit the hill-country. The jackal, the wolf, the hyena, and the panther, roam around the tents of the Beduins, or follow the track of the caravans through the solitary desert. The gazelle seeks pasture and shade in the isolated *wadis*. The woods of Yemen and Aden are inhabited by troops of monkeys. The lion, from the frequent allusions to it in ancient Arabic poetry, and from the number of names which the language has for it, must at one period have been very common.

Among the birds indigenous in Arabia, we find mentioned several large birds of prey, such as the eagle, the vulture, and several kinds of hawk. The carrion-vulture frequents battle-fields and performs the services of scavenger. The ostrich and other birds valued for their plumage live in the deserts. Tame fowls, pheasants, and different sorts of pigeon, are frequent in Yemen. Along the coast of the Red Sea, pelicans and various kinds of sea-fowl are found.

The locusts of Arabia, whose devastations are so often alluded to, are dried, and roasted or boiled, and in this state eaten by the Arabs. Niebuhr states that they are strung on threads and offered for sale in the markets of all the Arabian towns from Bab-el-Mandeb to Basra.

The sea, on the eastern coast of Oman, is so abundant in fish, that not only asses, cows, and other domestic animals are fed with them, but they are also spread on the fields, to

improve the soil, as manure. The pearl-fisheries of the Persian Gulf are universally celebrated. The bank on which pearl-shells are principally found extends from the Bahrein islands to very near the promontory of Juffar. The northern extremity, near the isles Karek and Bahrein, is distinguished as particularly rich in pearls. The pearl fisheries in this part of the Persian Gulf are alluded to by Arrian. (*Periplus Mar. Rubr.* c. 9.)

Divisions of Arabia. Arabia has been variously divided at different times, and by different authors. Strabo (xvi. c. 1.) divides the whole country into the Happy and the Desert Arabia, the former occupying the southern, and the latter the northern part of the peninsula. The triple division into Arabia Felix, Arabia Petraea, and Arabia Deserta, was introduced by Ptolemy: *Arabia Felix* he called the peninsula, as far as the isthmus already described; *Arabia Petraea*, so named from Petra, the ancient capital of the Nabathians, was the country between the Red and the Dead Sea, bordering upon Palestine and Egypt; and *Arabia Deserta* comprehended the whole extent of the Syrian desert, as far as the Euphrates, where we find Palmyra.

By some contemporary Christian writers on the history of the Crusades, the territory around Bastra, or the Aurantitis of the ancients, is called *Arabia Prima*; the country east of the Jordan had the name of *Arabia Secunda* or *Arabia Petracensis* (in allusion to its capital Krak or Karak, also named Petra Deserta, which was erroneously supposed to stand on the spot of the ancient Petra of the Nabathians); the country around Shanbek (Shubek) or Mount royal (Mons Regalis) was called *Arabia Tertia*, also *Syria Sahel*, or *Terra Montis Regalis*. Oriental writers generally enumerate five provinces of Arabia, viz. Yemen, Hejaz, Tehama, Nejd, and Yemama; some add Bahra as a sixth, while others consider this as part of Irak Arabia. The three provinces, Tehama, Nejd, and Yemama, are by some considered as subdivisions of Hejaz. Arabia Petraea, including Mount Sinai, is by most of them considered as belonging partly to Egypt and partly to Syria; and the northern part of Arabia Deserta is generally called the desert of Syria.

The following outline of the present division of Arabia is founded chiefly on that adopted by Niebuhr.

I. *Yemen*, bordering upon the Red Sea, and upon the territories of Hejaz, Nejd, and Hadramaut. It is subdivided, according to Niebuhr, into fourteen independent provinces, the principal of which are the following:

1. *Yemen Proper*, with the towns of Sana, in the mountainous district towards the high-land, the residence of the Imam of Yemen; Mokha, on the borders of the Red Sea, now the principal sea-port of Arabia; Zebid, Bet-el-Fakih, Hodeida, and Loheia, in the flat country along the coast of the Arabian Gulf.

2. *Aden*, with the celebrated ancient town and harbour of the same name, situated at the foot of high mountains which surround it on almost every side, and leave only one very narrow causeway by which the town can be approached on the land side. Aden was, during the twelfth, thirteenth, and fourteenth century, an important emporium in the European trade with India, which has since been transferred to Mokha. [See *ADEN*, ALBUQUERQUE.]

3. The principality of Kaukeban.

4. *Belad-el-Kobail*, an extensive mountainous district towards the north of Yemen Proper, the princes of which have maintained themselves independent of the Imams of Sana.

5. *Abu Arish*, with the mercantile town of Jozan on the Red Sea.

6. Two small territories called *Khanlan*, the one to the south-east of Sana, the other on the road from that town to Mecca.

7. *Sahan*, a large district in the hills between *Belad-el-Kobail* and Hejaz, mostly inhabited by independent Beduins.

8. *Nejran*, a pleasant and fertile country, rich in water, with excellent pastures, and famous for its camels and horses: its capital, Nejran, is by some supposed to be the Nagara of Ptolemy.

9. *Jauf* or *Jof*, a territory extending to a great distance over the Arabian high-land, to the east of *Belad-el-Kobail*, with the ancient Mareb or Mariaba, the capital of the Sabaeans.

10. *Yafa*, situated between Jof, Hadramaut, and Yemen Proper.

II. *Hadramaut*, a country once famous for its trade,

chiefly in frankincense, is bounded on the south-east by the Indian Ocean, on the north-east by Oman, on the north by the Arabian high-land, and on the west by Yemen. The trade with Oman and Yemen is carried on by sea; Dabar and Keshm are the principal harbours. Part of the country is occupied by independent Beduin chiefs, among whom the sheikh of Shibam is the most powerful. The island of Socotora or Socatra, famous for the aloe which it produces, was, at the time of Niebuhr's visit, subject to the chief of Keshm.

III. *Oman* extends along the coast of the Persian Gulf and the Indian Sea, and borders, on the west and south, on the great elevated desert which fills the interior of Arabia. The country is in some parts fertile in wheat, barley, Turkey corn, lentils, grapes, dates, and garden fruits; it also has lead and copper-mines. Rostak is the residence of the Imam of Oman. The harbour of Muscat is important as an emporium.

IV. *Independent States on the islands and borders of the Persian Gulf.* - Almost all the sea-ports in the Persian Gulf, occasionally even some on the Persian coast, are in the possession of Arabic tribes, who for the most part depend on navigation, fishery, and diving for pearls, for their livelihood. Dates, durra-bread, and fish, are their principal articles of food. Each little town has its own sheikh. In time of war, all their fishing boats are made battle-ships; and as with a navy of this description decisive battles cannot easily take place, the internal contests between the little states continue almost without an interruption. When a Persian army is sent against them, they leave their settlements on the coast, where they have but little to lose, and retire in their boats to some uninhabited island till the troops are withdrawn. Gombroon, or Bender-Abbas, and Abusheher, or Bushire, are the principal sea-ports on the Persian coast. The island of Kharej, or Kerek, in the northern part of the gulf, nearly opposite Abusheher, is, through its situation, an important station for eastern commerce. The little island of Hormuz, or Ormuz, in the straits which form the entrance from the Indian Sea into the Persian Gulf, is celebrated from the importance which it possessed while the Portuguese trade with India was flourishing. At no very great distance from Ormuz is situated the large island called Kishme, or Loft, by the Europeans, and Tawile, or Derâz, by the Arabs and Persians. The island, or rather the group of islands called Bahrein, near the western coast of the Persian Gulf, is celebrated for its pearl-fishery. It is said to have been very populous formerly, and to have contained upwards of three hundred and fifty towns and villages. The principal island of the group is known by the name of Awâl. The ancient harbour of Gerra is supposed to have been somewhere on the opposite coast of Arabia. (See Strabo, xvi. c. 4, p. 776, Casaub.)

V. The country of *Lahsa*, or *Hajar*, lies along the western shore of the Persian Gulf; the part immediately along the coast is sometimes called Bahrein. It borders on the south on Oman, on the west on the Arabian high-land, and on the north on the territory of the Beduin tribe Kaah, near the Shatt-el-Arab. The greater part of the country towards the interior is occupied by Beduins: the inhabitants along the coast subsist chiefly by the pearl-fishery, or the cultivation of date-trees. The principal towns are Lahsa, the residence of the sheikh, and Katif, a sea-port opposite the Bahrein islands, perhaps near the ancient Gerra.

VI. The country of *Nejd* occupies nearly the whole extent of the high-land of Arabia, from Yemen and Hadramaut in the south to the Syr desert on the north, and from Hejaz in the west to Lahsa and Irak Arabi on the east. It is inhabited almost exclusively by wandering tribes of Beduins. The hilly tracts are fertile, chiefly in dates; but rivers, and even the temporary *wadis*, are scarce, and to obtain water deep wells must be dug. The greater part of the country consists of arid deserts. The climate is excessively hot, but the air is pure and salubrious. Besides the moveable tents of the nomadic Arabs, the traveller meets with a number of small villages, irregularly built, but populous, and agreeably situated on the declivities of hills, or in the midst of verdant valleys.

The country of Nejd is at present subject to the Wahhabites, a religious sect, which not long ago threatened by its rapid progress to overthrow the whole Mohammedan community. The founder of this fanatic sect was Abd-Wahhâb, a native of Nejd, who lived several years at Mecca, and, after visiting Bagdad and Persia, returned to

his native country. Here he began to promulgate his religious opinions, which were soon embraced by many of the independent Beduin chiefs. We are still without an authentic and detailed account of the doctrine of Abd-al-Wahhâb; its main tendency seems to be, to reduce the Mussulman faith to a pure deism, by representing Mohammed and his predecessors, Moses, Jesus, &c. not as inspired prophets, but only as enlightened and benevolent men. The capital of the Wahhabite dominion, and the principal city of the whole Arabian high-land, is Dereïye, a town of about 2500 houses, picturesquely situated along the borders of the Wâdi Hanifa. This valley, extending itself from west to east, is several hundred English miles in length, and about one and a half in breadth: during part of the year it is watered by a torrent of rain from the mountains; during summer, the want of irrigation is supplied from the copious wells of the surrounding country. Dereïye has twenty-eight mosques, (but, contrary to the Mussulman fashion, without minarets and cupolas,) and thirty schools, in which the children receive instruction twice every day, except Fridays. The gardens and fields around Dereïye are fertile in dates, pomegranate-trees, apricots, peaches, grapes, melons, &c., also in wheat, barley, and millet. [See Rousseau, in the *Mines de l'Orient*, II., p. 155, &c.]

VII. *Hejaz* borders on the east on Nejd, on the north on the Syrian desert and the Gulf of Akaba, on the west on the Red Sea, and on the south on Yemen. It is the holy land of the Mohammedans, on account of the two sacred cities Mecca and Medina, the former the native town of Mohammed, the latter the place where he is interred. As long as the Grand Seigneur of Constantinople, in his character of Protector of the Holy Places, maintained his sovereignty over this important province, he used regularly to appoint a pasha, who resided in the citadel of Jidda, the sea-port of Mecca, with a Turkish guard, and divided the receipts of the custom-house with the sheriff of Mecca, who was considered as his vassal. The dominion of the Grand Seigneur was, however, little more than nominal, and the sheriff might very easily have made himself independent long ago, if the existing relations with Constantinople had not been advantageous to the Hejaz, on account of the rich presents annually sent from the Turkish capital to the sanctuary of Mecca, in which all the descendants of the prophet's family throughout the Hejaz, and almost every inhabitant of that town, were allowed, as servants attached to the temple, to participate. But when the power of the Porte in the African and Asiatic provinces became weakened, and when the increasing ascendancy of the Wahhabites cut off the communication between Constantinople and the sacred cities, the sheriff of Mecca became disinclined to remain tributary to the sultan. Disputes and open hostilities followed; the sheriff attacked the Turkish pasha at Jidda, destroyed his citadel, and got rid of him by poison. Soon, however, the sheriff found himself besieged by the Wahhabites; and the caravans of pilgrims, which annually proceed from all Mohammedan countries to Mecca, were frequently intercepted, and exposed to constant annoyance from the followers of the new religion. Mohammed Ali, the present viceroy of Egypt, at length succeeded in checking the power of the Wahhabites; he made himself master of the Hejaz, and assumed the protectorship of the holy towns.

'The number of pilgrims,' says Niebuhr, 'who annually assemble at Mecca is very great. One great caravan comes from Damascus, consisting chiefly of pilgrims from the Turkish empire. Another, coming from Egypt, brings along the Mogrebi or African pilgrims; both meet at a few days' distance from Mecca. Another caravan arrives from Bagdad, with which most of the Persian pilgrims travel. Two smaller caravans come from Lahsa and Oman, besides a separate company of pilgrims from Yemen, and numberless smaller crowds which arrive direct by sea from Persia, the southern and eastern parts of Arabia and the adjacent islands, from India, the Arabian colonies on the west coast of Africa, &c. Only a few pious Mohammedans perform the pilgrimage out of real devotion, and at their own expense; most of the pilgrims undertake the tour with a view to profit. Some accompany the caravan as soldiers, and are remunerated for the protection which they afford to the pilgrims against the attacks of the warlike Beduins; some are pilgrims by profession, and are paid to perform the sacred journey for others, who are prevented from discharging this religious duty personally.'

The principal towns of the Hejaz (Mecca, Medina, Jidda;

have already been alluded to. Besides these, we may mention Yanbo, the sea-port of Medina; Tayef, which is agreeably situated upon a lofty eminence, and supplies Jidda and Mecca with excellent fruits; Ghumfule, and Hali.

VIII. *The desert of Mount Sinai*, including the Arabia Petraea of the ancients, once the seat of the Nabathæan dominion, is now nearly desolate, and contains but few towns; the open country is entirely in the hands of the independent Beduins. The group of the Sinai mountains is the last considerable elevation towards the north-west of the mountains which form the high land in the interior of Arabia. It nearly fills a peninsula projecting into the Red Sea, having the Gulf of Akaba on the east, and that of Suez, called also the Gulf of Kolzum, on the west. At the northern extremity of the eastern gulf is situated the ancient town of Aila, the Elath of Scripture (Deut. ii. 8; 1 Kings ix. 26; 2 Kings xvi. 6), now commonly called Akaba. At the northern extremity of the western gulf lies the town of Suez, one of the few safe and spacious harbours in the Red Sea where ships can be repaired: it is now of secondary importance, as the traffic by sea between Egypt and the Hejaz is chiefly carried on from Kosseir; yet the trade in coffee and Indian goods still passes by Suez to Kairo. On the eastern side of the gulf of Suez is another good harbour called Bender-Tor, where the ships trading between Jidda and Suez are in the habit of anchoring to take in fresh water, which the neighbouring mountains supply of excellent quality. In the Sinai mountains we find sandstone, and on the highest parts granite. In the midst of the hills, on the height of Jebel Musa, surrounded by higher mountain-tops, and near the summit considered as the proper Sinai of Scripture, is situated the convent of St. Catherine, founded, according to the tradition, by Helena, the mother of Constantine, in the fourth century. Jebel Musa is rich in springs of fresh water: the surrounding valleys produce excellent grapes, pears, dates, and other fruits, quantities of which are brought for sale to Kairo. Wadi Faran, or Feiran, with its continuation Wadi-el-Sheikh, and Wadi Girondel, both to the north of Jebel Musa, and sloping towards the gulf of Suez, are filled with water during the rainy season, which obliges the inhabitants then to retire up the hills.

Towards the north of the group of Sinai is a desolate tract, called by the Arabs El-Ti, or Tiah-Bani-Israel, i.e. the desert of the children of Israel. Abulfeda (*Descript. Egypti*, p. 14, ed. Michaelis) states its dimensions from hearsay at forty parasangs in length, and as much in breadth, the soil being partly rocky and hard, and partly sandy, with now and then a well of brackish water. This account is fully confirmed by Burekhardt, who describes it as the most dreary and barren wilderness that he ever met with.

To the north of the Gulf of Akaba, in the hilly district of Jebel Shera, at a distance of about seven hours from Shobak, or Kerek-al-Shobak, its capital, the Wadi Musa opens itself, watered by the copious spring of Ain Musa. In this valley, below the village of Eldjy, Burekhardt discovered the magnificent ruins of a town which he, no doubt correctly, supposed to be the ancient Nabathæan capital Petra. 'The metropolis of the Nabathæi,' says Strabo, (book xvi., c. 4, p. 403, ed. Tauchnitz; Casaub. p. 779.) 'is a town called Petra. It is situated in a place which itself is smooth and level, but which is all around fenced by a circle of rocks, and on the outside consists of precipitous cliffs, while towards the interior it has copious springs for the watering of fields and for horticulture.' Pliny (N. H. vi., c. 23) describes Petra as situated 'in a valley somewhat less than two thousand paces wide, inclosed by inaccessible mountains, with a stream running through it.'

IX. *Tribes of Beduins, or Wandering Arabs.*—The word *beduin* is a corruption of the Arabic *badwi*, which is derived from the substantive *badu*, 'an open country, a desert,' and signifies an inhabitant of the desert. The Arabs who live in towns, Niebuhr observes, especially those near the sea-coast, have through their commerce had so much intercourse with strangers, that they have lost much of their ancient manners and customs. But the true Arabs, who have always valued their freedom higher than wealth and luxury, live in detached tribes under tents, and still adhere to the primitive form of government, habits, and usages of their ancestors. Their nobles they call sheikhs. A sheikh rules over his family, and all their servants. If they are unable separately to defend their property against a hostile neighbour, several petty sheikhs unite, and choose a chief from among themselves. Several chiefs, with the assent of the

petty sheikhs, submit to one still more powerful, who is called sheikh-al-kebir, or sheikh-al-shoyukh, and the entire body of united tribes is then named after the family of this supreme sheikh. The Beduins are all, as it were, born soldiers, while at the same time they attend to their cattle. The sheikhs of the great tribes have a large number of camels, partly for use in time of war, partly to transport the goods of merchants from one town to another, and partly for sale. The smaller tribes, which are less wealthy and independent, principally tend sheep. Agriculture, and other descriptions of hard work, they commit to their subjects, the common Arabs, who live in miserable huts: the sheikhs live under tents. Being accustomed to an atmosphere of great purity, the scent of these Arabs of the desert is uncommonly nice. It is said, they are able to live for five days without drinking. The government remains in the family of every greater or smaller sheikh: among the sons or nearest relations, not the eldest, but he who appears the best fitted, is chosen. They pay little or nothing in the way of taxes to their superiors. Every little sheikh is not only the protector, but also the leader of his family: he is, accordingly, looked upon by the greater sheikh rather as a confederate, than as a subject. If one of the little sheikhs is dissatisfied with his sheikh-al-kebir, and is nevertheless unable to depose him, he will remove with his cattle to another tribe, which is usually glad to strengthen its party. Every sheikh, however small may be, must therefore endeavour to govern his tribe well for fear of being deposed or deserted. The names of many tribes, once possessing great power, have thus fallen into oblivion; and small families, unknown before, have raised themselves to importance.

The Beduins have never been subjugated by foreign conquerors: only a few tribes who live near the large towns of Bagdad, Mosul, Orfa, Damascus, and Aleppo, are in some degree subject or tributary to the Grand Seigneur. The several tribes are often at war with one another: but their conflicts are neither of long duration nor sanguinary. Whenever any tribe is attacked by a foreign enemy, all the neighbouring chiefs will unite in defence of the common cause. Every sheikh considers himself as sovereign in his territory, and therefore entitled to exact a tribute from travellers passing through it. The Turkish sultans even used to engage themselves to pay annually a fixed sum of money, besides a number of garments, to the Beduin tribes on the route to Mecca, for not destroying the wells along the way, and for conducting the pilgrims through their respective territories. Nevertheless, disputes frequently arose between the sheikhs and the haughty Turkish leaders of the caravans, in consequence of which the pilgrims were often attacked and plundered.

The sheikhs are daily mounted on horseback or on their dromedaries, to inspect their subjects, to visit friends, or to enjoy the pleasures of the chase. The horizon in the desert is nearly as open as at sea. If a Beduin sees a solitary wanderer from afar, he rides towards him, and orders him to undress. In such cases, the Beduins are real robbers: yet it would be incorrect to say that they live chiefly from robbery. They seldom kill those whom they plunder, provided no resistance is offered; the robber is sometimes even kind and hospitable to the forlorn traveller whom he has plundered, furnishing him with provisions and old clothes in exchange for his own, and conducting him part of his way, that he may not perish in the desert.

The tents of the Beduins are made of a coarse kind of dark coloured cloth, woven by their own women, which is drawn over seven or nine poles fixed upright in the ground, the middlemost being the highest. The larger tents consist of two or three compartments, so as to have separate rooms for the men and women, and for the domestic animals. The poor, who cannot afford the expense of a regular tent, spread a piece of cloth, as large as they can get, near a tree, or take shelter in the caves of rocks from heat or rain. There is but little furniture in a Beduin tent: a mat of straw is used as table, chairs, and bedstead; spare clothes are kept in bags. The kitchen apparatus is very simple and portable. The pots are made of copper lined with tin: the dishes of the same metals, or of wood. Their hearth is easily built, they merely place their cauldrons on loose stones, or over a pit dug in the ground. They have neither spoons, nor knives and forks. A round piece of leather serves them as table-cloth, in which the remains of the meal are preserved. Their butter, which the heat soon melts down, they keep in leather bottles. Water is kept in goats'

skins a copper cup, carefully tinned over, serves as a drinking vessel. Wind mills and water-mills are unknown; all grain is ground in a small hand-mill. There are also no ovens in the desert: the dough is either kneaded into a flat cake, and baked on a round iron plate, or it is formed into large lumps, which are laid between glowing coals till they are sufficiently baked. Among the great sheikhs of the desert, who require nothing but pilau *i.e.* boiled rice—for their meals, a large wooden dish full is served up, around which one party after another sits down, till the dish is emptied, or all are satisfied. (*Niebuhr, Beschreibung von Arabien*, p. 379, &c.; also *Reise nach Arabien*, vol. i., p. 233.)

Ancient Arabia, as known to the western nations.—The history of antiquity is not without traces of an early influence of the Arabs on the condition of neighbouring nations. The book of Genesis (x. 10) mentions Nimrod as the founder of the Babylonian empire. And the beginning of his kingdom was Babel and Erech, and Accad and Calneh, in the land of Shinar. We think we recognize in Nimrod, the military hunter, an Arabian chieftain, like the modern sheikhs of the Beduins: in the passage quoted from the Hebrew, Erech is, according to several of the ancient versions, the modern Orfa (Edessa); Accad is supposed to be Nisibis, in Mesopotamia; and Calneh to correspond to the situation of Ctesiphon on the Tigris.

Egypt seems at an early period to have been infested by invasions from Arabia: for we cannot hesitate to consider the Hyksos as predatory Arabian tribes. They are said to have occupied the Delta, and even to have penetrated as far as Memphis: the king of Thebes, Thutmosis, at last succeeded in expelling them. Their dominion over Egypt is said to have lasted 251 years: it is supposed from the eighteenth till the sixteenth century before the Christian era. Sesotris is said to have built a wall, 1500 stadia long, from Pelusium to Hehopolis, to protect Egypt from a repetition of such invasions; but this story about the wall is open to several serious objections.

Among the nomadic tribes in the northern tracts of Arabia, the Mehanites seem to have early applied themselves to traffic with the neighbouring nations. It was a caravan of Midianite merchants to whom Joseph was sold (Gen. xxxvii. 28, 36). Arabia was the country of frankincense; and so essential a requisite of religious worship in all the temples of antiquity would soon give great importance to the trade of foreign countries with Arabia. Gerra, probably situated near the present El Katif or Lahsa, was, according to Strabo, a Babylonian colony, founded by Chaldean emigrants. The exact period of its foundation is unknown; but the companions of Alexander the Great found it as an opulent town (Strabo, xvi. c. 3, p. 766, Casaub.), and it must have been long prospering as an emporium. The advantages for an extensive commerce by land and by sea, possessed by a harbour thus situated on the spacious Persian Gulf, are striking. From Gerra the productions of both Arabia and India were shipped to Babylon, and farther up the Euphrates to Thapsacus, whence they spread by land all over western Asia.

Considerable variety of opinion prevails concerning the situation of Ophir, the country whence the ships of Solomon, conjointly with those of the Phœnicians, brought gold, silver, gems, sandalwood, and other precious articles (1 Kings ix. x. ii. 22). Bochart, Reland, and other critics sought it

India. Modern historians are inclined to think that it situated in Arabia. The name is, in the book of Genesis (x. 29), enumerated among Arabian tribes descended from Joctan, and a town named El-Ofir has recently been found on the coast of Oman. (*Bohlen's Indien*, ii. p. 137.)

In the history of ancient commerce generally, Arabia is of importance not only on account of the export of its own productions, but also as an intermediate station in the trade with India. Herodotus (iii. 107) calls Arabia the only country where frankincense, myrrh, cassia, and ladanum are to be found: Strabo (xiv. c. 1, tom. 3, p. 395, ed. Tauchnitz) mentions the province of Cattabania in particular as the country of frankincense, and Chatramotitis (Hadramaut) as that of myrrh. Gold and precious stones are also often alluded to by the ancients as indigenous productions of Arabia Felix. Gold-mines are not at present known to exist: some precious stones, such as the onyx, the ruby, and a kind of agate called the Mokha-stone, are common in Yemen and Hadramaut. In enumerating cinnamon among the productions of Arabia, Herodotus probably confounded the real productions of the country with the other foreign articles, which, like

ivory and ebony, the western nations might procure from Arabian emporia.

Antiquity abounds in proofs of the early trade of the Phœnicians with India, which must in a great measure have been carried on through Arabia. One of the earliest and most important allusions to this mercantile intercourse of the Phœnicians with several towns or countries and tribes of Arabia, occurs in the elegy of the prophet Ezekiel on the fall of Tyre. We insert a literal translation of the passage, leaving the proper names in their Hebrew forms, and subjoining to each, between parentheses, the probable modern or classical equivalent.

Ezek. xxvii. 12. 'Tarshish (Tartessus) was thy (Tyre's) customer, on account of the variety of all [thy] treasures: silver, iron, tin (*bedil*?), and lead did they (the merchants from Tarshish) place on thy markets.

13. Yavan (Greece), Thubal (the Tibareni in Pontus), and Meshech (the Moschi between Armenia, Iberia, and Colchis) dealt with thee: souls of men (slaves), and copper vessels did they bring on thy markets.

14. Those from the house of Thogarma (Armenia) brought on thy markets horses for draught and horses for war, and mules.

15. The sons of Dedan (according to Bochart, a town on the Persian Gulf: according to Heeren, one of the Bahrein islands: why should it not be here, as elsewhere, the tribe in the neighbourhood of Idumæa?) dealt with thee: many islands transacted business with thee: with ivory and ebony did they repay thy gifts.

16. Aram (Syria) was thy customer on account of the variety of thy manufacture: [in exchange] for gems, and red purple, and embroidery, and byssus, and corals, and crystal [which Aram brought] on thy markets.

17. Juda and the land of Israel dealt with thee: wheat of Minnith (a town in the land of the Ammonites), and sweetmeats, and honey, and oil, and balsam did they place on thy markets.

18. Damesek (Damascus) was thy customer, on account of the variety of thy manufactures, and on account of the variety of all [thy] treasures: [in exchange] for wine from Chelbon (Haleb, Aleppo) and shining wool [which Damesek brought in return].

19. Vedan and Yavan (both here Arabian towns or tribes not yet ascertained) brought weavings on thy markets: wrought iron, cassia, and calamus hadst thou for sale.

20. Dedan (a tribe in the neighbourhood of Idumæa) dealt with thee in carpets that are spread to sit upon.

21. Arab (Arabia) and all the chiefs of Kedar (the Arabes Cœdreni of Pliny) were transacting business with thee: they were thy customers with their lambs and rams and he-goats.

22. The tradesmen of Sheba (Sabæa in Arabia Felix) and of Raîma (the Rhegma of Ptolemy, on the Persian Gulf) dealt with thee: the choicest of all spices, and all [sorts of] precious stones, and gold did they bring on thy markets.

23. Haran (Carrhæ, the modern Harran in Mesopotamia) and Canneh (Calneh, *i.e.* Ctesiphon?) and Eden (probably the Ma'dan of Syrian writers, in the province of Diarbekir), the tradesmen of Sheba (Sabæa), Ashur (Assyria), and Kilmad (not yet ascertained) dealt with thee.

24. They dealt with thee in rich garments, in crimson and variegated cloth, and in chests full of many-coloured weavings, tied with ropes, and firm, [which they brought] on thy markets.

Professor Heeren, in his valuable work on ancient commerce, (*Ideen*, &c. vol. i. part ii. p. 102, &c., fourth edit.), has adopted the interpretation of J. D. Michaelis, according to which, by the first three names in verse 23, three great Arabian harbours on the coast of the Indian Sea are to be understood. This we think improbable, since almost all the other names which can be traced with some degree of certainty belong to northern countries; besides the special evidence in favour of the identity of at least Haran with Carrhæ. To arrive at a precise conclusion as to the exact import of many of the names mentioned by the Hebrew writer, is perhaps the more hopeless, as it is clear enough, from the context, that the Phœnician merchants (in the same manner as the Nabathæans afterwards) did not resort to the places personally, but received their goods from thence by foreign caravans: thus the name and situation of the countries whence the several articles came would be less attended to than if the case had been the reverse.

Besides this caravan trade with the Phœnicians, the inter-

course of the ancient Arabs with the western world seems to have been but scanty, and, accordingly, the accounts of Arabia given by the classical writers are imperfect. The intrepid valour of the Arabs was proverbial among the Greeks and Romans. The body of the nation has escaped the dominion of the most powerful monarchies that have arisen and fallen in its immediate neighbourhood. Of the ancient Persian empire, Herodotus (iii. 88.) expressly mentions, that all nations of (western) Asia were subject to Darius Hystaspis, except the Arabs, who were the independent confederates of the Persians: and when Cambyses had formed the design of invading Egypt, he was obliged to seek the friendship of some Arabs, who engaged to supply the Persian army with water during its march through the sands of Arabia Petræa. (Herodot. iii. 7-9.) If Plut., the conqueror of the new Assyrian empire, is said to have subdued the Arabs, or if Sanherib is called the ruler of Assyria and Arabia, this can only be understood as applying to the northern tribes of Arabia.

Alexander the Great is said to have contemplated the circumnavigation of Arabia and the subjection of its predatory hordes. The fleet of Nearchus was preparing to make the circuit of the peninsula, when the death of Alexander prevented the execution of the design.

The Nabathæi (*Nebathoth*, Gen. xxv. 13; xxviii. 9; Isa. lx. 7) inhabited, according to Diodorus (ii. 48), the north-eastern part of Arabia, which was subsequently, in allusion to the name of their capital Petra, called Arabia Petræa. Diodorus describes them as a valiant nation, safe in their deserts as in an asylum, where none but themselves knew the springs of water. Like other Beduin tribes, they subsisted in a great measure by predatory excursions: but they seem at an earlier age than their neighbours to have applied themselves to an independent traffic, and in consequence also to other occupations of peace. 'Some of them,' says Diodorus, 'make it their business to transport to the Mediterranean frankincense, myrrh, and other spices, which they obtain from those that bring them from Arabia Felix.' Their territory was repeatedly invaded by the states arising out of the Macedonian empire. Demetrius, the son of Antigonus, and afterwards Antiochus the Great (224-187 B.C.), attacked them without success. The Nabathæans maintained their independence, and their trade flourished even more than previously. After Syria had become a Roman province (64 B.C.), its governors Seamus and Gabinius repeatedly threatened Petra with an invasion. In the reign of Augustus, Ailius Gallus is recorded to have conducted an expedition into Arabia Felix, in which Obodas, then king of Petra, assisted him with a thousand Nabathæan Arabs. The Roman army landed at Leukokōm (Yanbo), and after a fatiguing march of several months reached Marsyabæ (Strab. xvi. c. 4, p. 407, Tauchnitz), the capital of the Sabæans. But want of provisions, and the bad effects of the climate, compelled the invaders to a speedy retreat to the coast, and over the Red Sea to Egypt. It is to this expedition that Propertius (ii. 8) alludes in the lines:

* India quin, Auguste, tuo dat colla triumpho,
Et domus intactæ te tremit Arabiæ.

In the reign of Trajanus, Arabia Petræa became, through the victory of A. Cornelius Palma, a Roman province (A.D. 107), and the northern countries, towards the east of the river Jordan, formerly in the possession of the Nabathæans, continued to be subject to the Romans even after the death of Trajanus. A Roman legion was stationed at Bostra, and the Emperor Philippus, who was born here, hence received the surname of *Arabs*. Petra sunk into insignificance: its inhabitants deserted it, and sought the freedom of their deserts; even the place where it had flourished was forgotten: till, in our own time, Burckhardt discovered the ruins of Wadi Musa.

History of the Arabs.—Of the internal history of Arabia before Mohammed, our knowledge is very imperfect. Prior to the beginning of the third century of the Christian æra, all that has been transmitted to us by Arabic writers amounts only to some genealogies or lists of kings, without any fixed chronology, and interspersed with but a few facts unsatisfactorily recorded.

The Arabians are, by their own writers, (*Abulfaraj, Hist. Dynast.* p. 100) distinguished into two classes, the old and the modern tribes. As belonging to the old Arabians, which are now entirely extinct, we find enumerated the tribes of Ad, Thamud, Tasm, Jadis, the (ancient) tribe of Jorham, and Amalek. The names of these tribes now only survive

in vague traditions: thus Sheddad, of the tribe of Ad, is said to have founded the magnificent city and the delicious garden of Irem, which are often alluded to in eastern poetry, and fancied by some to be still extant, though now miraculously hidden from view in impassable deserts. The present or modern Arabians are, by their own historians, divided into pure or genuine, and imitations or naturalized Arabs: the former date their origin from Kahtan (the Yoktan of the Old Testament, Gen. x. 28), and the latter from Adnan, a descendant of Ismael, the son of Abraham and Hagar. These Ismaelide Arabs seem to have settled chiefly in Hejaz; while the southern part of the peninsula received its inhabitants through the Kahtanides or Yoktanides. Kahtan's son was Ya'rab, who was the father of Yash'ab: the son of Yash'ab was Abd-al-shams, (or according to some, Amer,) surnamed Saba. This Saba had a great number of sons, two of whom, Hinyar (pronounced by some Honeir) and Kahlan, had a numerous progeny. The family of Hinyar, it appears had, during 2020 years, the general government over all the descendants of Saba who were settled in Yemen, whence the name of the Hinyarides (or Honeirides) was sometimes taken by foreign nations as synonymous with that of Sabæans. Hinyar was, according to Arabian authors, the first king of the family of Kahtan that wore a crown. He is said to have governed fifty years. The only fact which we find recorded of him is, that he expelled the tribe Thamud from Yemen into Hejaz. Various reports exist as to Hinyar's successor: according to some it was his son Wathel: according to others his brother Kahlan: probably Wathel succeeded him in Yemen, and Kahlan in Hadramaut. Similar variations in the lists of kings given by different authors (*Abulfeda, Hamza of Isfahan, Nuvieri, Masudi, &c.*) are observable throughout the ancient history of Yemen. Among the succeeding rulers, Al-Harith-al-Rayesh is distinguished as the first conqueror among the kings of Yemen: he also first received the title of *Tobba*, i. e., 'successor,' which became hereditary in his line. Dsul'manar Abrahā and his son Dsul'adsar are reported to have made conquests in Nigritia and other parts of Africa. The next sovereign but one in succession after Dsul'adsar is queen Balkis, according to Arabian authors, the queen of the Sabæans who visited Solomon (1 Kings x. 1, seq.; 2 Chron. ix. 1, seq.). Many generations after Balkis, in the reign of Akran, an event occurred which forms an important epoch in the history of Arabia. Impetuous mountain-torrents used frequently to destroy the labours of agriculture in the plains of Yemen, till some ancient king (according to some, Lokman, according to others, Hinyar himself) opened channels which brought the waters to the sea, constructed an immense dike or mound between two hills just above the capital Mareb (or Saba), which prevented sudden inundations, and from the reservoir thus formed, supplied the gardens and fields below, through aqueducts, with the necessary irrigation. The country around Mareb had thus become fertile and happy; but its prosperity depended on the preservation of the mound, which in the lapse of time fell into decay. Its final ruin is one of the few facts in the ancient history of the Arabs, the period of which can with some degree of probability be ascertained. According to De Sacy, it occurred about the beginning of the third century. This event, which is in oriental writers designated by the name of *Seil-al Arim*, i. e., 'the Torrent of the Mound,' caused a great change in the whole peninsula. Amru ben Amer, surnamed Mosaikiya, one of the nobles of the country, perhaps the chief of the Kahlanides, had been previously warned of the imminent danger: he sold his estates, and with a number of families quitted Yemen and went into the country of Ace. After the death of Amru, the emigrant families separated, and settled in different countries. The family of Amru's son, Jofna, established itself in Syria, and founded the kingdom of the Ghassanides in the desert S.E. of Damascus, which embraced the Christian religion, and formed part of the Roman or Grecian dominions; till, in the reign of the caliph Omar, it was incorporated in the Mohammedan empire. The tribes of Aus and of Khasraj, descended from Amru by his son Thalaba, went to Yatreb (afterwards called Medina). The descendants of Azl settled partly in Oman, and partly in the country of Sherat in Syria; Malce ben Fahm, also of the family of Azl, established himself in Irak, and founded the kingdom of Hira, which was governed during 597 years by a succession of twenty-five kings, who at last became vassals to Persia: till, in the caliphate of Abu Bekr the country was subjected to

the Mohammedan dominion. The tribe of *Tai*, which had left Yemen soon after Amru ben Amer, settled in the Nejd, between the mountains of Aja and Solma, since called the mountains of *Tai*. The family of *Rebia*, grandson of Amru, settled at Mecca, and received the name of *Khozaa*.

In the series of the Himyaride kings that ruled over Yemen after Akran and the *Seil-al-Arim*, there is almost as much confusion as in the earlier part of it. We shall not enter into an enumeration of the names, but refer the reader to the dissertation of De Sacy, *Sur divers frèremens de l'Histoire des Arabes avant Mahomet*, in the fiftieth volume of the *Mémoires de Littérature of the French Academy*, and to Johannsen's *Historia Jenuae* (Bonn, 1825).

The fountain *Zemzem* and the black stone in the ancient temple of Mecca, called the *Caaba*, had, from immemorial time, been regarded by the Arabs as national sanctuaries. The (modern) *Jorhanides*, descended from *Jorhan* the son of *Kahlan*, had established themselves in Hejaz about the same time that *Yarab* settled in Yemen, and had for many ages been the hereditary protectors and keepers of the *Caaba*; when Amru ben Loheia of the tribe *Khozaa*, with the Yemenese emigrants from *Ace*, and assisted by the tribe of *Bekr*, availed himself of the opportunity of a dispute between the *Jorhanides* and the neighbouring *Ismaelides*, to expel the former from Mecca, and take possession of the sanctuary. Soon, however, the tribe of *Bekr* felt indignant at being excluded by a stranger from the governorship over the *Caaba*, which honour, after the services they had rendered, they considered due to themselves. They entered into a treaty with *Kosaï* of the *Ismaelide* tribe of *Koreish*, and by his assistance compelled the tribe of *Khozaa* to resign the charge which it had assumed. But the tribe of *Bekr* was again excluded from the guardianship of the temple, which came through *Kosaï* into the hands of the tribe of *Koreish*. It is calculated that this happened about A.D. 464.

The grandson of the *Koreishide* *Kosaï* was *Hashem*, who is reported to have averted a famine by giving up his treasures. His son *Abd al Motaleb* is famous for his victory over *Abraha*, an *Æthiopian* ruler of Yemen, and a Christian, who approached Mecca with an army and several elephants, intending to destroy the *Caaba*. A miracle is said to have preserved the sanctuary, and to have destroyed the army of *Abraha*. The year of this victory is in the chronicles of the East named the 'Year of the Elephant,' in allusion to the elephant on which *Abraha* was mounted, which suddenly refused to proceed further when the army was approaching the sacred city: it is the year 571 of our era. Another event rendered it still more universally memorable: for in it *Hashem's* grandson, *Abdallah*, became the father of the Arabian prophet *Mohammed*.

Yemen had since the *Seil-al-Arim* become temporarily subject to foreign power. The Jews, who since the destruction of Jerusalem had in great numbers retired into Arabia, had made proselytes of several Arabian tribes, particularly those of *Kenana*, *Kenda*, and *Hareth ben Kaaba*, and had already gained considerable power in some parts of the peninsula. *Dsu-Nowas*, who occupied the throne of the *Himyarides* towards the close of the fifth century, adopted their religion, and began cruelly to persecute all those who would not follow his example. Christianity had about the same time found its way into the southern parts of the peninsula, and had become the religion of the tribes of *Himyar*, *Ghassan*, *Rebia*, *Tagleb*, *Bahra*, *Tanuh*, *Tai*, and *Kodaa*, besides the inhabitants of *Hira* and of *Nejran*. The inhabitants of *Nejran* in particular were suffering from the atrocious cruelty of *Dsu-Nowas*, when the *Negus* of *Abesh* came to the assistance of his persecuted fellow Christians. The Jewish Arabs were vanquished; *Dsu-Nowas*, in despair, sought a voluntary death by throwing himself into the sea, and Yemen became an *Æthiopian* province. This *Æthiopian* occupation of Yemen became of a melancholy importance to the civilized world through the small-pox which the victors brought with them into Arabia, and which, by the conquests of the Mohammedans, soon spread all over the earth. In consequence of a revolt among the *Æthiopian* occupants, *Abraha* came in A.D. 519 to the command of Yemen. He endeavoured with great zeal to spread Christianity among the Arabs, and with this view built a church at *Sana* which he intended should, as a place of pilgrimage, vie with the ancient *Caaba*. The heathen Arabs, indignant at this measure, profaned the new-built church, and *Abraha*, to avenge the insult, resolved on an expedition against of the failure of which (A.D. 571) has already been

alluded to. After a reign of twenty-three years, *Abraha* was followed by his sons *Yeksum* (572-589) and *Masruk* (589-601). During the reign of the latter, *Seif ben Dsi-Yezen*, an offspring of the ancient royal *Himyaride* family, obtained the assistance of a Persian army under *Welhraz*, with the aid of which he put an end to the *Æthiopian* power, after it had lasted about 72 or 73 years. Yemen was now governed by Persian prefects, till it became subject to the Mohammedans, when the last of the prefects, *Badсан*, embraced the Mussulman faith.

The Arabs before *Mohammed*, like those of the present day, partly dwelt in cities, and partly as wandering tribes in moveable encampments. The inhabitants of cities subsisted by agriculture and by different trades, especially by commerce, in which the tribe of *Koreish* appears early to have distinguished itself. The wandering Arabs employed themselves in the breeding and tending of cattle, and occasionally in the pillage of travellers. The picture exhibited by ancient poets (especially in the romance *Antar* by *Asmaï*) of their customs and mode of life, entirely corresponds to the representation which modern travellers make of the manners of the present *Beduins*. The elements forming the sphere of their life are so simple, and their habits so closely adapted to the nature of their country, that the lapse of time can work no perceivable change in their social state. Hospitality, expertness in the use of arms, horsemanship, and eloquence in his own copious and energetic language, were of old, as they still are, the accomplishments on which the Arab valued himself most.

With respect to the religion of the ancient Arabs, our information is very imperfect. As they were ranging their trackless deserts beneath the concave of unclouded skies, they seem to have been early led to the worship of the heavenly luminaries. The tribe of *Himyar* is said to have chiefly worshipped the sun: *Kenana*, the moon: *Tai*, the fixed star *Sohail* (*Canopus*): *Misum*, the star *Aldebaran*, &c.; *Saba*, the ancient capital of Yemen, had a temple built in honour of the planet *Venus*: the temple of Mecca was, according to some, originally consecrated to *Saturn*: and *Abd-al-Shams*, i.e., 'Servant of the Sun,' is a name occurring several times in the fragments of *Ante-Islamitic* history. The *Koran* alludes to three female deities: *Allat*, (see *Herod. iii. 8.*) adored by the tribe of *Thakef*, whose temple, at *Nakhla*, was destroyed by *Mogaira* in the ninth year of the *Hejra*; *Al-Uzza*, adored by the tribes of *Koreish* and *Kenana*, under the form of a tree; and *Menat*, the goddess of the tribes of *Hudseil* and *Khozaa*. Two other deities, *Asaf* and *Nafila*, were adored by the tribe of *Koreish*, the one under the form of a man, and the other under that of a woman. Five more are noticed, which were worshipped under various human and animal shapes, besides a number of inferior idols, belonging to particular families. Among the tribe of *Temim*, in the Persian Gulf, the Persian fire-worship is said to have been introduced. The idea of goblins and fairies, some of a terrific, some of a mild and placid character, was early associated with the loneliness of the deserts. Fortune-telling, necromancy, astrology, and sorcery, were early at home in Arabia.

Such was the condition of the Arabs about the beginning of the seventh century. A few small provinces in the north had, like the neighbouring countries of Syria, Palestine, and Egypt, become subject to the Grecian empire, while those bordering on the Euphrates acknowledged Persian supremacy, and an *Æthiopian* dynasty ruled temporarily in the south. The great mass of the country remained free, and probably even ignorant of these slight encroachments of foreign dominion. The Arabs, long celebrated for their valiant and intrepid character, had never yet been united by a common tie into one mass. Their wandering tribes, without fixed mutual relations, scattered over a vast extent of land, and often engaged in transitory feuds among each other, continued to enjoy unlimited independence. The union of these tribes into a nation, and the greatness of that nation as a link in the chain of historical events, dates from the promulgation of the Islam by *Abu'l-Kasem Mohammed*. The noble inspiration, the firm belief in the truth and divine origin of the new religion, and the intrepid courage which animated the prophet and his successors, the natural inclination of the Arabs towards war and perilous undertakings, the weakness of the neighbouring governments, and the precept of the *Koran*, which enjoined the propagation of the Islam, and war against the unbelievers as a religious duty,—spread within a century

the dominion, the faith, and even the language of the Arabs, from the Atlantic Ocean to the Indus, and from the Indian Sea and the African Deserts to Franco, the Mediterranean, Asia Minor, and the Caspian Sea.

Mohammed was born in the tribe of Koreish, at Mecca, according to some on the 10th of November, 570, according to others on the 21st of April, 571, *p.c.* In his twentieth year he took part in an expedition against predatory hordes which then molested the pilgrims on their way to Mecca. Five years later he visited the fair of Damascus as the agent of Khadija, a rich widow, whom he subsequently married. In the fortieth year of his age (A.D. 610) came the *Leilat-al-Kadr*, i.e. 'the Night of the Divine Determination,' in which, the Mohammedans believe, the angel Gabriel called him to become the prophet of God. Khadija his wife, his cousin Ali ben Abi Taleb, and his father-in-law Abu-bokr, were the first who acknowledged his divine mission. Twelve years had elapsed, when a revolt at Mecca threatened the life of Mohammed. The day of his flight to Yatreb (since called Medina or Medinat-al-nabi, *i. e.* 'The Town of the Prophet'), the 16th of July, 622, has become the era from which the Mohammedans count their years. With it commenced a war against the opposers of the new religion. When Mecca was conquered, when the tribes of Arabia joined in the profession, that 'There is no God but Allah, and Mohammed is his apostle,' the prophet commanded to spread the Islam over all countries, and to unite into one community, by conquest or by faith, all the nations of the earth. Mohammed died at Medina, the 8th of June, 632, in the sixty-third year of his age. [See MOHAMMED.]

The Byzantine empire had just then been engaged in a long conflict with Persia. The despotism of its rulers, frequent though inefficient revolutions, and constant efforts for the repression of foreign enemies, the low state of the finances, notwithstanding an oppressive taxation, and the discord of contending religious sects, had exhausted its strength. The Persian empire had sunk still lower: the superannuated doctrine of Zoroaster could no longer animate its followers in the contest against a religion defended and propagated by a new nation with all the vigour and enthusiasm of youth. This weakened state of the two principal neighbouring empires favoured the quick progress of the Arabian conquests. Whoever adopted the Mohammedan faith became embodied in the new state, and was no longer regarded as a stranger. Jews and Christians were tolerated, but required to pay a tribute: death awaited the followers of other religions. The supreme pontificate and worldly command were united in the person of Mohammed's successors, the caliphs. Many of these were individually weak; but their authority and the might of the empire were supported by a religious belief which was rooted deeply in the mind of the nation.

The history of the first century of the caliphate exhibits an almost continuous series of conquests. In the reign of Abu-Bekr, the valiant Khaled conquered the whole of Syria and Mesopotamia; in that of Omar the victories of Amru ben As added Egypt to the Arabian empire; after a siege of fourteen months, Alexandria was taken; Memphis fell, and Amru laid in the neighbourhood of its ruins the foundation of Fostat, the present Old Cairo. The conquest of Egypt was soon followed by that of Cyrenaica and the other states along the coast of the Mediterranean: congenial habits united the Berber hordes of Africa with the sons of the Arabian Desert. The victories won by Saad ben Abi-Wakkas over the Persian forces near Cadesia (635), Jalula (637), Holwan, and Nehawend (642), decided the fall of the Persian throne. Under Osman, the island of Cyprus was plundered (648); Abdallah ben Amer conquered Khorasan, and penetrated as far as Balkh. The reign of Ali ben Abi-Taleb was spent in the quelling of internal commotions, which ended in the murder of the caliph by the hand of the fanatic Abdorrahman ben Moljam, and the accession of the Ommiades to the caliphate.

Moawiya, the first of the Ommiade caliphs, removed the residence of the empire from Kufa, near the Euphrates, to Damascus. In his reign Okba ben Nafi laid the foundation of Kairwan (675), and penetrated as far as Tanger and the Atlantic. Okba was murdered when he was preparing to pass over into Spain, in consequence of which many of the provinces conquered in these distant regions were lost again; but after a few years (688), the entire northern coast of Africa, as far as the Straits of Gibraltar, was in the possession of the Arabs. In the reign of Walid I. (705-715),

the dominion of the Arabs attained its widest extent. Julianus, the governor of Ceuta, incensed, it is said, against his sovereign, king Roderic of Spain, who had disgraced his daughter, surrendered Algeziras (Jezirat-al-Khadra, 'the Green Island,') into the hands of the Arab Tarik ben Ziad, who, at the command of the African governor Musa ben Nosair, landed at the promontory which still bears his name (Gibraltar, corrupted from Jebel Tarik, the mountain of Tarik), vanquished Roderic in the battle of Xerez de la Frontera (19 July, 711), and in a short time subjected the greater part of Andalusia, Granada, and Mureia to the Mohammedan power. In the East, Koteiba ben Moslem, the governor of Khorasan, took possession of Mawaralnahr, Bokhara, Turkestan, and Khowarezm; and Mohammed ben Kasem-al-Thakefi made conquests in the northern parts of India. Under Soleiman (715-717) the greater part of Asia Minor was conquered, and Constantinople besieged; and in the reign of Omar ben Abd-al-Aziz (717-720) the countries of Jorjan and Tabaristan were added to the empire. But the want of energy of the latter caliph, as well as of his successor, Yezid II. (720-724), and the avarice of Hesham (724-743), roused a spirit of dissatisfaction in the interior, and encouraged the revolutionary attempts of other aspirants to the caliphate. It was in the reign of Hesham that the arms of the Muslims experienced their first signal defeat; the victory of Charles Martel over Abdorrahman ben Abdallah, near Poitiers (Oct. 732), checked for ever the further progress of the Arabs on the continent of Europe: the river Aude, in Languedoc, became the frontier of their dominion.

When, in the year 749, the family of Abbas came to the command over the Faithful, all the surviving Ommiades were cruelly persecuted: Abdorrahman ben Moawiya only escaped into Spain, and became the founder of the Ommiade caliphate of Cordova (756).

Under the Abbasides, who fixed their residence at Bagdad, but few additions were made to the Mohammedan empire: the islands of Crete, Corsica, Sardinia, and Sicily, became subject to the Arabs of Spain and Africa. The sovereigns of the House of Abbas generally distinguished themselves as much by their love and zeal for the arts and literature, as their predecessors had done by their warlike achievements. The names of Mansur, Harun-al-Rashid, and Mamun, are for ever entitled to an honourable place in the history of letters, and their reigns form the brilliant epoch of the Mohammedan power. But their love of mental refinement, and their fondness for a quiet and luxurious life, withdrew the attention of the Abbaside caliphs from the affairs of government; internal disturbances soon became frequent: the authority of the court of Bagdad became imperceptibly diminished, at first in the distant provinces of the empire. Abdorrahman, by establishing an independent Ommiade dominion in Spain, had set an example which the prefects of other countries soon followed. The caliphs were obliged to assemble a life-guard of Turkish mercenaries around their throne, and surrendered the care of the government into the hands of ministers of unlimited authority, the *Emirs al Omara*. Through these arrangements, and through the encroachments of the Seljukide Turks, the caliphate had long since become a merely nominal dignity, when Hulaku took Bagdad (1258), and put an end to the dominion of the Abbasides. [See *ABBASIDES*.]

The history of the several Mohammedan states which arose out of the caliphate from the ninth century, does not, strictly speaking, belong to the history of the Arabs; we shall, however, here briefly enumerate the principal dynasties.

I. In Spain, the *Ommiades* reigned till 1038. Among the small principalities which sprung up afterwards; that of Granada maintained itself till 1492.

II. In Africa, 1. in Egypt, Ahmed ben Tulun established in 868 an independent dominion, which remained in the possession of his family, the *Tulunides*, till 905, when Egypt returned to its allegiance to the caliphate. From 935-969, the *Ikhshids* or *Akshids*, the family of Abu Bekr Mohammed, a descendant of the ancient kings of Ferghana ruled over Egypt. They were in 969 followed by the *Fatimides*, or *Moezzides*, who called themselves descendants of Fatima, the daughter of Mohammed: their dominion lasted for two centuries, and extended from the Euphrates to Kairwan. In 1171, the *Fatimides* were succeeded by the *Ayubide* dynasty, which was in 1250 followed by the dominion of the *Bahuride Mamluks*. In 1517, Egypt became a Turkish province.

2. In Kairwan, Ibrahim ben Aglab declared himself independent in the reign of Harun-al-Rashid (805); the dominion of his family, the *Aglabides*, in the territory of the ancient Carthaginians, continued till the beginning of the tenth century.

3. In Fez, Edris, a descendant of Fatima, founded an independent kingdom (788), which remained in the hands of his family, the *Edrisides*, till 985, when it became tributary to the Fatemides.

4. The *Zeirides*, descendants of Yussuf Belkin ben Zeiri, governed over Tunis and the surrounding country, from 978 till the middle of the twelfth century.

5. In Morocco, Abdallah founded about 1056 the religious sect and the dominion of the *Morabets*, which soon extended itself as far as the Straits of Gibraltar, and subsequently caused the fall of the Ommiades in Spain. (See *ALMORAVIDES*.)

III. In Asia, 1. in Khorasan, Taher had already under Mamun, in 819, declared himself independent. His successors, the *Taherides*, were soon obliged (873) to yield the dominion over the adjoining Persian provinces to the *Saffarides*, descendants of Yacub ben Leith.

2. The *Samanides*, who pretended to be of the race of the ancient kings of Persia, established a powerful dynasty in Khorasan and Mawarahnahr, which reigned from 898 till 999, when it was overthrown by the Gasnevites.

3. Nasireddin Sebuktegin founded the dynasty of the *Gasnevites* in the eastern part of Persia, which ruled at Gasma from 976 till 1182; they were obliged to yield to the *Ghurides*, and these, in 1208, to the sultans of Khwarezm.

4. The *Dilemite* dominion originated early in the ninth century, among the emigrant descendants and followers of the caliph Ali, who had taken refuge in the hilly parts of the provinces of Ghilan and Mazenderan. It continued from 927 till 1029, when the Gasnevites took possession of the country.

5. The *Buides* (properly *Bacuhides*) ruled in Persia, and had their residence at Shiraz; they were in 932 recognized by the caliphs. They kept the title and power of Emir al-Omara till their dominion was overthrown by the Seljuks in 1056.

6. An *Ismaelide* dynasty arose at Kasbin in Persia since 1090, and lasted till the Tatar invasion in 1256. They are only a ramification of the religious sect of the Ismaelians, which, under different names (viz., Batenians, Karmates, Fatemides, Druzes, Nosairis, &c.), has often played an important part in the history of Mohammedism.

7. The *Hamadanides*, in Syria, ruled over Mosul from 929 till 978; and their successors the Merdasides over Aleppo till 1086.

8. The *Assassins* were a fanatic sect in Mount Lebanon, who gained great importance at the time of the Crusades; the present Druzes are believed to be their descendants.

9. The *Seljukide Turks*, under Togrul Beg, occupied Bagdad in 1055; their dominion over Aleppo lasted till 1154; over Kerman till 1187; over Iran till 1195; and over Iconium till 1308. Independent of them, a dynasty of Atabeks had since 1127 established itself in the country east of the Caspian Sea.

Since the time when the Ommiade caliph Moawiya chose Damascus for his residence, and still more when the Abbasides removed the seat of the government to Bagdad, the country of Arabia relapsed into its former insignificance; it became a mere province of the Mohammedan empire, and was soon again divided into small domains. Curious details about the history of one of the most important of these divisions, that of Yemen, from the time of Mohammed till near the close of the fifteenth century, are to be found in Johannsen's *Historia Jemanae*. Except the monotonous enumeration of the annual procession of pilgrims to the sacred city, the mutual conflicts among the Beduin chiefs, and of late the rise of the Wahhabite power in the Nejd, the recent history of Arabia generally offers little of sufficient interest to fix the attention of the general historian.

After the conquest of Syria, Persia, Mauritania, and Spain, the trade of the Arabs became of great importance. The Islam favoured the establishment of emporia, and the wide dominion of one religion and one language rendered travels and mercantile transactions easy. The luxury of the court of Bagdad, and the magnificence of the Abbaside caliphate, caused frequent travels of merchants into India. Since the ninth century of our era, Arabs began to settle in various parts of India; several Indian princes embraced

the Mohammedan faith. Soon the Arabs penetrated to the Indian islands, Ceylon, Sumatra, Java, Celebes, and even to China. Arabian caravans proceeded over land as far as Tartary and Siberia in the north; in Africa they came to the Niger, where, since the tenth century, the Mohammedan states of Ghana, Wangara, Tokkur, Kuku, and afterwards those of Senaar, Darfur, Burnu, Tumbuctu, and Meli, were founded. On the coasts of Africa they came through the Straits of Bab-el-Mandeb to Zanguebar, established the harbours of Makdashua, Melinde, Sofala, Kelu, and Mozambique, and went over to Madagascar. It is even probable that Lusitanian Arabs were, in the eleventh century, the first discoverers of America. (See *Notices et Extraits des MSS. de la Bibl. du Roi*, vol. ii. p. 25; Kosegarten, *Dissert. de Mohammede Ebn Batuta*, Jena, 1818, 4to.; Rasmussen, *Essai sur le Commerce et les Relations des Arabes et des Persans avec la Russie et la Scandinavie dans le moyen âge*, in the *Journal Asiatique*, vols. v. and vi., Paris, 1824, 1825, 8vo.)

Arabian Language.—The Arabic forms, with the Ethiopic, the southern ramification of the great stock of languages commonly, though improperly, called the Semitic; the other two principal branches are, 1. the Aramaic branch, indigenous in Syria, Mesopotamia, and Babylonia, comprising the Syriac and Chaldee languages; and 2. the Hebrew, once the language of Palestine and Phœnicia. These dialects have flourished at different epochs. Of the Hebrew, we possess the earliest written documents. About the time when it ceased to be a living language, the Chaldee makes its appearance. Whatever we possess in Syriac is of a still more recent date. The literature of the Arabic language does not reach far back beyond the age of Mohammed. At present most of these Semitic languages are extinct, or survive only in small districts. The Arabic alone has outlived all its sister-tongues, and has spread not only as the vernacular tongue all over Syria, Egypt, and Northern Africa, but also as the language of religion throughout Persia, the Turkish empire, and all countries into which the Mohammedan faith has been introduced.

Various dialects prevailed among the Arabian tribes previous to the age of Mohammed, among which that of the tribe of Koreish has, through the Koran, become the classical tongue. Ebn Khaldun thinks that the reason of the elegance and purity of the Koreishide dialect is to be found in the seclusion of that tribe from intercourse with foreigners. Next to Koreish, the neighbouring tribes of Thakif, Hudseil, Khozaa, Kenana, Asad, Temim, and Ghatfan, are by native writers distinguished for the correctness of their language; less so the Yemenese Arabs, and the tribes of Rebia, Lakhm, Jodham, Ghassan, Iyyad, and Kodhaa. Niebuhr observes that the Arabic is at present spoken with the greatest purity in the district of Sahan. The Arabic language is rich, not only in words (especially in such as refer to natural objects and to the life of a nomadic people), but also in grammatical inflections, particularly in the verb, where certain general modifications of the meaning are briefly and energetically expressed by slight changes in the form of the roots. The purity and copiousness of their language had among the Arabs long been an object of national pride. When, after the first conquests of the Mohammedans, its genuine correctness seemed to become endangered through the frequent and unavoidable intercourse with strangers, grammarians arose, to fix its rules and secure it from corruption. Abu'l-Aswad al-Duli is mentioned as the first author on Arabic grammar; he flourished under the caliph Ali ben Abi Taleb. Among the subsequent Arabian grammarians, Sibawaih, Ebn Malek, Zamakhshari, Ebn Hesham, Ebn Doreid, Motar-rezi, Tebrizi, Reidhawi, &c., deserve to be distinguished. Khalil ben Ahmed al-Farahidi, of Basra, who lived during the second century of the Hegira, reduced the prosody and metrics of the Arabic poets into a system. Abu Nasr Ismael ben Hammad al-Jauhari (A.D. 1000, or, according to others, 1009) compiled a dictionary of the pure Arabic language, containing about 40,000 words, and entitled *Al-Sihah*, i. e., 'the Purity (of language)'; this work is still of great value in oriental philology on account of the numerous quotations from ancient poems which are adduced in illustration. Al-Darir and Al-Sighani, two other lexicographers flourished, the one in the eleventh and the other in the thirteenth century. In the fourteenth, Mohammed ben Yacub al-Firuzabadi (A.H. 817, A.D. 1414) compiled an immense Arabic thesaurus, entitled *Al-Lami*, i. e., 'the

Illuminator,' of which the author himself prepared an abridgment under the title of *Al-Kamus*, or 'the Ocean;' the latter work contains about 60,000 words, and is the best original Arabic dictionary that we possess; an accurate edition of it was published at Calcutta in 1817; a Turkish translation appeared at Scutari, in three volumes, folio, 1815-1817.

The period at which the art of writing was introduced into Arabia is not known. Arabian authors speak of an alphabet used by the ancient Himyarides, which they call *Al-Mosnad*: this alphabet is now lost. In the second volume of the *Mines de l'Orient* may be found a copy of a few undeciphered inscriptions discovered by Seetzen, between Doffar and Mankat, near Jerim, in Yemen, which he supposed to be in the *Mosnad* character. The northern Arabs do not appear to have had any alphabet till a short time before Mohammed: Morar ben Morrah is said to have introduced an alphabet which was founded on the Syriac Estrangelo character. In it the Koran was written, originally without diacritical points and vowels, which were, however, added before the end of the first century after the Hegira. This character, which was called the Cufic, in allusion to the copyists that lived at Cufa, remained long in use on coins and inscriptions: for common purposes a current handwriting, known under the name of *Neshki*, was introduced by Ebn Moka, in the tenth century. This is the character still in use: the Persian *Talik* and the African *Mogrebi* character are modifications of it.

To European students who wish to acquire a knowledge of the Arabic language the following works deserve to be recommended:—Silvestre de Sacy's *Grammaire Arabe*, 2d edit., Paris, 1832, 2 vols., 8vo.; Ewald's *Grammatica Critica Lingue Arabice*, Leipzig, 1831-1833, 2 vols., 8vo.; Rosemüller's *Institutiones ad Fundamenta Lingue Arabice*, Leipzig, 1818, 4to.; S. de Sacy's *Chrestomathie Arabe*, 2d edit., Paris, 1826-1830, 4 vols., 8vo.; Kosegarten's *Chrestomathia Arabica*, Leipzig, 1828, 8vo.; Golius' *Lexicon Arabico-Latinum*, Lugduni Batav., 1656, folio; Wilmet's *Lexicon Lingue Arabice in Germanum, &c.*, Rotterdam, 1784, 4to.; Freytag's *Lexicon Arabico-Latinum*, Halle, 1830, seqq., 4to. (not yet completed.)

The modern vernacular Arabic does not materially differ from the classical language of the Koran, which has become the model and standard of correctness for all Arabic writers; but in the grammatical forms time seems to have produced a change similar to that which we perceive in other languages, the history of which we can trace with accuracy. Many terminations in the inflections of the verb and noun have disappeared, and their want is supplied by auxiliary words. The pronunciation is said to vary considerably in different countries: that of Yemen is esteemed the purest. Among the grammars which have appeared of the modern Arabic, that of Caussin de Perceval (Paris, 1823, 4to.) is considered the best.

Arabic Literature.—It is now generally agreed by those who study oriental literature, that the Arabs do not possess any authentic literary relics anterior to the sixth century of our era, and that the poems called *Muallakat* all belong to that or the beginning of the next century. It cannot, however, be disputed that, at the time when they were composed, the language and the poetry of the Arabs had already attained a high degree of cultivation; the language appears in them with perfect grammatical regularity, and subject to all the rules of a fixed system of prosody.

The life of a nation secluded by the nature of its country from the introduction of foreign refinement, and compelled by its occupations of hunters and herdsmen to live in small clans spread over a wide extent of country, amidst the awful solitude of deserts, the terrors of which, while tempting the spirit of the hazardous to dangerous enterprise, seem to endear the security of a sociable home, and to tie closer the bonds of fellowship, appears of itself rich in poetic elements; and indeed, as far as we are able to trace back the character of the Arabs, we find the love of poetry one of its essential features. The appearance of a poet in a family was hailed with congratulations by the neighbouring tribes, and we hear of assemblies annually held at Okadh, in Yemen, where poets from all parts of Arabia contended for a prize by reciting their compositions: the poems of the successful competitors were, it is said, written in letters of gold and hung up on the Caaba, whence they were named *muallakat*, i.e., 'the suspended.' Seven of these poems, those of Amru ben Kolthum, Amrulkais, Antara, Tarafa, Lebid, Hureth, and Zohair, have been preserved to us; and the careful man-

ner in which they have been commented upon by native grammarians (Zuzeni, Nakas, &c.) attests the importance that was attached to them by the Arabs in subsequent ages. The poem of Shanfara, that of Asha, and that of Nabega Dhobyani, are in some manuscripts appended to the *Muallakat*. More comprehensive collections of ancient poems are the *Diwan* of the Hudseilides, the *Hamasa* of Abu Temmam (about A.D. 830) explained by the scholiasts Tebrizi and Merzuki, and the small *Hamasa* of Bokhtori (A.D. 896). A *Diwan* of Hatim Tai and of Taabbata Sharran, besides a single poem of Caab ben Zohair, are handed down separately.

Mohammed recommended learning and poetry, and the admired and often truly sublime diction of the Koran attests that he himself was no stranger to the powers of poetic language. Yet during the first century after his death, in the reign of the warlike Ommiades, the voice of poetry was silenced or not heard in the noise and tumult of war. 'But,' says Abulfaraj (*Hist. Dyn.*, p. 216), 'when Allah called the family of Hashem (i.e. the Abbasides) to the government, and surrendered to them the command, the hearts returned from their indolence, the minds awoke from their torpor.' Among the writers who flourished under the earlier Abbasside caliphs, Asmai deserves to be distinguished: to him is ascribed a romance of great celebrity in the east, called *Antar*, after the name of its hero; it exhibits an interesting picture of the condition of Arabia shortly previous to the appearance of Mohammed, especially of the life of its wandering tribes, of which it gives as lively a representation as the well-known *Arabian Nights* do of the state of society in the Arabian towns. The exact period to which the composition of this latter work must be assigned is still subject to discussion. That some of the most fanciful and enchanting tales in the collection are derived from an Indian source appears to us undeniable, although notions and images suited to the sphere of ideas of a Mohammedan and an inhabitant of western Asia have been carefully substituted for every allusion to polytheism and Hindoo institutions that might have puzzled the imagination or shocked the good sense of a Mussulman reader.

Among the poets who flourished during the caliphate, we must be satisfied here to mention the names of Abu'l-Atahia, Dsu'l-Rumma, Ferezdak, Abu Temmam, Bokhtori, Hamadani, Hariri, Motenabbi, Abu'l-Ola, Omar ben Faredh, &c. Specimens of the works of some of them will be found in the *Anthologie Arabe*, by Grangeret de Lagrange (Paris, 1828); in the collection published at Calcutta, under the title of *Hadiyat al-Afrak*; and in Carlyle's *Specimens of Arabian Poetry* (Cambridge, 1796).

Al-Mansur, the second of the Abbasside caliphs, was the first who distinguished himself through his zeal for literature, especially for the study of the law, of astronomy, mathematics, and philosophy. The celebrated Christian physician George Bakhtishu, with his disciple Isa ben Shahlata, and the Persian astronomer Nubakht, lived at Al-Mansur's court: Bakhtishu seems to have first drawn the attention of the Arabs to Greek and Syriac literature. Harun al-Rashid, by the advice of his accomplished minister and friend Yahya ben Khaled, the Barmecide, called Gabriel the son of Bakhtishu to his court, who then lived at Nishapur: he caused many Greek and Syriac works to be translated into Arabic, and established colleges in the principal towns of the empire. In the reign of Mamun the literature of the Arabs saw its golden age. Among the foreign scholars who lived at his court, we distinguish the Indian physician Saleh ben Nahala, and the Syrian Yahya ben Mesawaih (commonly called Joannes Mesue). The works of Aristotle, of Hippocrates, Galen, Dioscorides, and Theophrastus, of Euclid, Archimedes, and Ptolemy, were translated partly from the Greek originals, partly through intermediate Syriac versions. Among the translators we find mentioned the Sabian astronomer Thabet ben Korra; the Christian physician Honain, with his son Ishak, and his grandson Hobalish ben al-Asam; Yahya ben Batrik, Yahya ben Adda, Ibrahim ben Takwin, and others. At the command of Mamun, Mohammed ben Musa, of Khwarezm, wrote the first elementary treatise on Algebra, evidently drawn in a great proportion from Indian sources. Mamun founded academies at Bagdad, Basra, Kufa, and Bokhara, and furnished scholars with the necessary means to visit foreign countries for literary purposes. In his reign Yahya ben Abi'l-Mansur built and superintended observatories at Bagdad and Damascus. Soon after the accession of Theophilus to the throne of the Grecian empire (A.D. 829) a war

had broken out between him and Mamun, in which Theophilus was unsuccessful. He was, like his antagonist, a friend to science, and, in order to negotiate a peace, sent the celebrated scholar Joannes Grammaticus as ambassador to the court of the caliph. The assistance and advice of this envoy were of great value in the scientific undertakings then encouraged by Mamun; and Joannes was so much in favour at Bagdad, that he would doubtless have effected a reconciliation between the two courts, had not the caliph died in the midst of the negotiation.

In the subsequent times of the caliphate, the Emirs al Omara and the Bawaihide (Buide) sultans encouraged literature; in almost all the dynasties which sprung out of the caliphate, there were some sovereigns, at least, who loved the sciences and patronized scholars. The dynasty of the Fatemides in Egypt is in this respect distinguished. Ibrahim ben Aglab, the founder of the Aglabide dynasty, made Kairwan a seat of learning; and Zeiri encouraged literature in the town of Afshir, which he had founded in the territory of the present Algiers.

In Spain, the Ommiade caliphs followed the example of Al Mansur and his successors. An exchange of learned ambassadors took place between Abdorrahman III. (912-961) and the German Emperor Otto I. His son Hakem founded the university of Cordova, and many colleges and libraries in Spain; his own library is said to have contained not less than 600,000 volumes. Gerbert of Aurillac, who afterwards ascended the papal throne as Sylvester II., studied at Cordova, and introduced into Europe the Arabic decimal system of numerical notation, for which the Arabs themselves were indebted to the Hindoos. Several English scholars, Adelard or Adhelard of Bath, in the eleventh, and Robert and Daniel Morley in the twelfth century, also visited the Arabic universities of Spain. It was through Spain, and through the Arabic versions, that the attention of the schoolmen was first drawn to the writings of Aristotle.

Among the Arabic philosophers, Pococke (in a note prefixed to his edition of Ebn Tofail) selects the following as the most distinguished: Abu Nasr Mohammed al-Farabi (died A.D. 912), Abu Ali al-Hossein ben Abdallah ben Sina, commonly called Avicenna (born A.D. 980), Abu Hamed Mohammed al-Gazali (d. A.D. 1111), Abu Bekr Mohammed ben Yahya ben Baja, commonly called Avenpace (d. A.D. 1129 or 1139), Abu'l-Walid Mohammed ben Ahmed ben Mohammed ben Roshd, commonly called Averroes (d. A.D. 1198), and Abu'l-Kasein al-Jonaid (d. A.D. 910).

Some of the most celebrated Arabic writers on mathematics and astronomy are the Sabian Thabet ben Korra, the Christian Ishak ben Honain, Mohammed ben Musa, Jaber ben Asla, Behaeddin of Amol, Mohammed ben Jaber al-Battani, Al-Fergani, Ibn Yunis, Abu'l-Hassan Kushyar, Ulugh-Beg, &c.

The literature of the Arabs is particularly important on account of its numerous and valuable historical works: of most of the following authors in this department, the reader will find some account by turning to their respective articles. The earliest historical writer of the Arabs, of whom we have any knowledge, was Hesham ben Mohammed ben Shoaib al-Khelebi (d. A.D. 826). In the same century lived Ibn Koteiba, Abu Obeida, Mohammed ben Omar al-Wakedi, Abu'l-Abbas Ahmed al-Beladsori, and Asraki. Since the beginning of the tenth century, history became a favourite study of the learned Arabians. Masudi, Tabari, Hamza of Isfahan, and the Christian patriarch of Alexandria Eutychius, also called Said ben Batrik, were among the earliest authors of works on universal history. They were followed by Abulfaraj, George Elnakin, Ibn al-Amid, Ibn al-Athir, Mohammed Hemavi, Abulfeda, Nuweiri, Jaleddin Soyuti, Ibn Shohna, Abu'l-Abbas Ahmed al-Dimeshki, &c. Abu'l-Kasein Khalef ben Abdalmalek ben Baskwal of Cordova (d. 1139), Tomimi, Ibn Khatib, Ibn Alabar, Ahmed ben Yahya al-Dhobi, and Shehabeddin Ahmed al-Mokri (or al-Makari) wrote chronicles of the Arabian dominion in Spain; Kotbeddin in the sixteenth, and Abu'l-Hassan Bekri in the eighteenth century, composed histories of Mecca; Omar ben Ahmed Kemaleddin (d. 1261) wrote a chronicle of Aleppo; Ibn Khallikan, Ibn Abi Oseibia, Dsahebi, and others, compiled biographical dictionaries; Makrizi, Abdalatif, Shehabeddin ben Abi Hija, Marai ben Yussuf al-Hanbali, Jemaleddin Yussuf ben Tagri Bardi, and Mohammed ben al-Moti, wrote special works on the history of Egypt; Behaeddin and Emadeddin wrote biographies of the Sultan Saladin; Ibn Arabshah described the life of Timur;

Ibn Khaldun, besides various other works of high interest, wrote a history of the Berbers; Haji Khalfa composed a bibliographic work on the history of literature among the Arabs, Persians, and Turks.

Damiri, Ibn Beitar, and Kazwini, left books on natural history; the latter is also the author of a work on geography. Peculiar to the Arabic geographers is the division of the earth (the northern hemisphere) into seven climates, or as many zones, which are counted from the equator towards the north pole, and are measured by the increase of the duration of daylight at the summer-solstice. Among the Arabic writers on geography we must notice Ibn Khordadbeh, Istakhri, Abu Is'hak al-Faresi and Ibn Haukal, who flourished in the tenth century; the Sherif Edrisi (often called *Geographus Nubiensis*), who lived in the twelfth century in Sicily under Roger I.; Omar Ibn-al-Wardi; Yakuti (d. 1249), and Al-Osyuti. More information than from the professedly geographical works of some of these writers, may perhaps still be obtained from the accounts given by Arabic travellers of the countries which they had visited. Al-Hassan ben Mohammed al-Wassan al-Fasi, of Grenada, commonly known under the name of Leo Africanus, travelled through Asia and Africa; Ibn Waheb and Abu Zeid al-Hassan visited India and China in the ninth century; Selam al-Tarjoman visited central Asia during the reign of the caliph Wathek; Abdal-Rizzak travelled in the fifteenth century as ambassador from Persia to India; Mohammed Ibn Batuta wandered in the fourteenth century through the interior of Africa, India, Java, China, Russia, Greece, Spain, &c.

A history of Arabic literature is still wanted. A good account of the works printed in Arabic till the year 1811 may be found in Schnurrer's *Bibliotheca Arabica*. Those who want further information on the subject of Arabic literature must consult the *Notices et Extraits des MSS. de la Bibliothèque du Roi*, the *Bibliotheca Arabica Escurialensis* of Casiri, the *Bibliotheca Orientalis* of Assemani, the *Chrestomathie Arabe* and other works published by De Sacy, Meiller's *Catalogue of the Arabic MSS. at Gotha*, Uri's and Nicoll's catalogues of the MSS. in the Bodleian library, the *Mines de l'Orient*, the *Bibliothèque Orientale* of D'Herbelot, &c.

ARABIAN GULF. [See RED SEA.]

ARABIAN NIGHTS. [See ARABIA, p. 219.]

ARABII were, according to St. Augustin (Hæres. c. 83), a sect of Christians in Arabia, who believed the human soul to be mortal, and that it is dissolved by death together with the body, but will be restored to life at the resurrection. Mosheim (in *Commentariis de Rebus Christianorum ante Constantinum Magnum*, ed. 1753, p. 718, seq.) thinks, that the materialism of Epicurus had some influence on the origin of this sect: but it is more likely that the prevailing opinion in those days of the materiality of the human soul occasioned their heretical inferences. The Arabii were confuted and converted by Origen in a synod held in Arabia, A.D. 246 (Mansi, *Collectio Conciliorum*, t. i. p. 789).

ARABLE LAND, so called from the Latin word *arare* 'to plough,' is that part of the land which is chiefly cultivated by means of the plough.

Land in general is divided into arable, grass land, wood land, common pasture, and waste. The first of these is by far the most important in agriculture. In this article we shall briefly explain the principles on which are founded the most improved methods of cultivating arable land, by which the natural produce of the soil is greatly increased, and many productions are obtained in perfection which are foreign to the soil and climate.

We shall, first, consider the nature and properties of various soils.

2. The best modes of preparing and improving the natural soil, so as to increase its produce.

3. The most advantageous succession of crops, so as to obtain the greatest returns, with the least diminution of fertility.

Of Soils.—When the surface of the earth is penetrated, we generally find that the appearance, texture, and colour vary at different depths. There is a layer of earth nearest the surface, of greater or less thickness, which covers the more solid and uniform materials which lie below it. This may be particularly observed wherever there are natural or artificial excavations or pits. A distinct line, nearly parallel to the surface, generally marks the depth of the upper soil, and separates it from the sub-soil. The soil is more or less composed of minute parts of various kinds of earth, mixed

with animal and vegetable substances, in different states of decomposition; and to these, in a great measure, it owes its colour, which is generally darker than that of the sub-soil. Except where iron, peat, coal, or slate abound in the soil, a dark colour is an indication of corresponding fertility. The rich soil of gardens, long cultivated and highly manured, is nearly black. As the soil is the bed in which all vegetable productions are to be reared, and in which they are to find their proper nourishment, its texture and composition become objects of great importance to the cultivator; and, without a competent knowledge of these, no practical rules can be laid down or depended upon.

All soils are composed of earths,* metallic oxides, saline substances, vegetable and animal matter, and water. The earths are chiefly clay or alumina, flint or silica, and lime.

Magnesia, barytes, and other earths are occasionally met with, but in so few instances that they may be omitted in the list.

Of the metals, the most abundant is iron in the state of peroxide. The other metals are rarely found near the surface.

Saline substances form a small part of a soil, but an important one.

Potassa exists in almost every vegetable, soda in a few, and ammonia is produced by the decomposition of animal matter, but from its volatile nature it is not long retained in the soil, except when it forms a fixed compound with other substances.

The vegetable acids, as a general rule, are perhaps limited to small portions of acetic acid in combination with some base, as lime or potash.

The mineral acids are found united with earths and alkalis, in the state of neutral compounds.

These saline substances have a powerful effect on vegetation, and a knowledge of their proportions in the soil and of their various qualities, is indispensable in order to modify or correct their action by other substances for which they have an affinity.

Water, in a state of combination, or of mere mechanical diffusion, is essential to the growth of all plants: without it, and atmospheric air, there is no life either animal or vegetable.

Of the Earths.—Clay or alumina, so called because it is obtained in its purest state from alum, in which it is combined with the sulphuric acid,† is the basis of all strong and heavy soils. When it is minutely divided, it is easily suspended in water; when dried slowly, and stirred while drying, it becomes a fine powder soft to the feel, and when kneaded with water, a tough ductile mass easily moulded into hollow vessels, which retain liquids. This property, of being impervious to water, gives the specific character to clay as an ingredient of the soil. In a pure and unmixed state it is absolutely barren. When clay is heated to a great degree, it parts with the water combined with it; it is then said to be baked, as we see in bricks. It is no longer diffusible in water, and differs little from silica or sand in its effects on the soil.

Silica, or the earth of flints, suffers no change in water. It consists of crystals, or fragments, of very hard stone, forming *gravel* or *sand* according to their size; and the finest siliceous sand, when examined with a magnifying glass, has the appearance of irregular fragments of stone without any cohesion between them.

Siliceous sand holds water in its interstices by simple cohesive attraction in proportion to its fineness. It heats and cools rapidly, letting the water pass through it readily, either by filtration or evaporation. Its use in the soil is to keep it open, to let the air and water, as well as those other substances on which the growth of plants depends, circulate through it. Unmixed, it dries so rapidly that no vegetation can continue in it, unless a constant supply of moisture be given by irrigation. A small portion of clay will much improve light sands; it takes a large quantity of sand to correct the tenacity of clay.

Lime in its pure state is familiar to every one as the basis of the mortar used in building. It is produced by burning marble, chalk, limestone, or shells, in a great heat. In the stones which are formed principally of lime it is combined

* We retain the old division, although the earths have been ascertained to be oxides of peculiar metals, but as they are never found in the soil in their metallic state, the results and reasonings are not affected by this circumstance.

† Sulphuric acid, commonly called oil of vitriol, is composed of sulphur and oxygen, which is the pure or vital part of the atmosphere. [See Art.]

with some acid, most generally the carbonic acid, which separates from it by the operation of burning, in the form of an air or gas, hence called *fixed air*, from its being thus *fixed* in a stone. These stones, of various degrees of hardness, are now all classed under the name of carbonates of lime.

Lime unites readily with water, which it also absorbs from the atmosphere. It then becomes *slaked*. By uniting with carbonic acid, it returns to its former state of carbonate; with this difference, that, unless much water be present, it remains a fine impalpable powder. Pure lime is soluble in water, though sparingly; a pint of water cannot dissolve more than about twenty grains: the carbonate is not soluble in water. Carbonate of lime has a powerful effect on the fertility of a soil, and no soil is very productive without it. It is consequently used extensively as an improver of the soil, otherwise called a *manure*; but its use in this respect, and the mode in which it acts, will be given in the articles *MANURE* and *LIME*.

Carbonate of lime, as an earth, is neither so tenacious as clay, nor so loose as sand. In proportion to the fineness of its particles it approaches to the one or the other, and when the parts are large and hard it takes the name of limestone gravel.

Its distinguishing feature is its solubility in acids, which it neutralizes, depriving them of their noxious qualities in the soil. A proper mixture of these three earths, in a due state of mechanical division, forms a soil well fitted to the growth of every species of plants, especially those which are cultivated for food; and nothing more is required than a proper climate as to heat, a proper degree of moisture, and sufficient nourishment, to make all the plants generally cultivated thrive most luxuriantly in such a mixture, which is usually called a loam.

But there are some soils, which, besides a proper mechanical texture and mixture of earths, contain a large proportion of a natural manure which renders them extremely fertile. This is a substance produced by the slow decay of animal and vegetable matter. It can be separated from the other parts of the soil, and has been accurately analyzed and described by many of the most experienced chemists, particularly by Fourcroy, Davy, Chaptal, and Theodore de Saussure. (See *Recherches Chimiques sur la Végétation*, Paris, 1804, 8vo.) This substance has been called *vegetable mould*; but, as this is not a very distinct term, we shall, after Thaer and other eminent writers on agriculture, adopt the name of *humus* when speaking of it. Humus is a dark, unctuous, friable substance, nearly uniform in its appearance. It is a compound of oxygen, hydrogen, carbon, and nitrogen, which, with the exception of nitrogen, which is found only in some substances, are the elements of all animal and vegetable substances. It is the result of the slow decomposition of organic matter in the earth, and is found in the greatest abundance in rich garden mould, or old neglected dunghills. It varies somewhat in its qualities and composition, according to the substances from which it has been formed, and the circumstances attending their decay. It is the product of organic power, such as cannot be compounded *chemically*.

Besides the four essential elements in its composition, it also contains other substances in smaller quantities, viz., phosphoric and sulphuric acids combined with some base, and also earths and salts. Humus is the product of living matter and the source of it. It affords food to organization. Without it nothing material can have life. The greater the number of living creatures, the more humus is formed; and the more humus, the greater the supply of nourishment and life. Every organic being in life adds to itself the raw materials of nature, and forms humus, which increases as men, animals, and plants increase in any portion of the earth. It is diminished by the process of vegetation, and wasted by being carried into the ocean by the waters, or it is carried into the atmosphere by the agency of the oxygen of the air, which converts it into gaseous matter. (See Thaer, *Grundsätze der Rationellen Landwirthschaft*, Berlin, 1810, four vols. 4to.)

Humus, in the state in which it is usually found in the earth, is not soluble in water, and we might have some difficulty in comprehending how it enters into the minute vessels of the roots of plants; but here the admirable provision of nature may be observed. Humus is insoluble and antiseptic; it resists further decomposition in itself, and in other substances in contact with it. It remains for a long time in the earth unimpaired; but no sooner is it brought

into contact with the atmosphere, by the process of cultivation, than an action begins. Part of its carbon uniting with the oxygen of the atmosphere, produces carbonic acid, which the green parts of plants readily absorb: while its hydrogen with the same forms water, without which plants cannot live; and in very warm climates, where this process goes on more rapidly, the moisture thus produced keeps up vegetable life, when rains and dews fail. The residue becomes a *soluble extract*, and in that state is taken up readily by the fibres of the roots. But the changes still go on; the extract absorbs more oxygen, and becomes once more insoluble, in the form of a film, which Fourcroy calls *vegetable albumen*, and which contains a small portion of nitrogen, readily accounted for. By bringing fresh portions of humus to the surface and permitting the access of air to it, more carbonic acid, water, extract, and albumen are formed, and give a regular supply to the plants, which, by their living powers, produce the various substances found in the vegetable kingdom of nature. Hence we see the great importance of frequently stirring the surface of the earth between cabbages and other vegetables.

It is to the patience and perseverance of the chemists above-named that we owe this insight into the wonderful process of vegetable growth. What we here state is on their authority.

We can now readily understand the great importance of humus, and of those rich manures which are readily converted into it, when not immediately absorbed by plants. But it has still another property, highly important to fertility: it renders stiff clays porous, and consolidates loose sands. It does so more than lime, or any other earth. Hence a soil with a considerable proportion of humus is much more fertile than the quantity of alumina, or of sand, in its composition would lead one to expect, as we shall see when we come to the analysis of soils of known fertility; and we see the great advantage of animal and vegetable manures, not only as nourishment to vegetables, but as mechanical improvers of the texture of soils.

The greatest enemy of humus is stagnant water; it renders it acid and astringent, as we see in peat; and soils abounding with vegetable matters, from which water is not properly drained, become *sour*, as is very justly said, and produce only rushes and other useless and unpalatable plants. The remedy is simple and obvious; drain well, and neutralize the acid with lime; by these means abundant fertility will be restored.

In very light soils humus is seldom found in any quantity, being too much exposed to the air, and rapidly decomposed; the extract is washed through them by the waters, and as they waste manure rapidly, they are called *hungry*. Such soils are very unprofitable, until they are improved and consolidated by clay or marl, which makes them retain the moisture.

With calcareous earths humus acts well, provided they are pulverized and of sufficient depth. Some chalky soils are rendered very fertile by judicious culture and manuring.

In order to ascertain the probable fertility of a soil, it is very useful to analyze it and find out the proportion of its component parts. To do this with great accuracy requires the knowledge of an experienced chemist: but, to a certain degree, it may be easily done by any person possessed of an accurate balance and weights, and a little *spirits of salts*, or muriatic acid. For this purpose, some of the soil, taken at different depths, not too near the surface (from four to eight inches, if the soil is uniform in appearance), is dried in the sun till it pulverizes in the hand, and feels quite dry: the small stones and roots are taken out, but not minute fibres. A convenient portion of this is accurately weighed: it is then heated in a porcelain-cup, over a lamp, or clear fire, and stirred, till a chip or straw put in it turns brown. It is then set to cool, and weighed: the loss of weight is the water, which it is of importance to notice. Some soils, to appearance quite dry, contain a large proportion of water, others scarcely any. It is then pulverized and sifted, which separates the fibres and coarser parts. The remainder, again weighed, is stirred in four or five times its weight of pure water; after standing a few minutes to settle, the water is poured off, and it contains most of the humus and soluble substances. The humus is obtained by filtration, well-dried over the lamp, and weighed. The soluble substances are obtained by evaporating the water: but, unless there is a decidedly saline taste, this may be neglected. The humus may be further examined by heating it red hot in a cru-

cible, and stirring it with a piece of the stem of a tobacco pipe, when the vegetable part will be consumed, and the earths remain behind; thus the exact quantity of pure vegetable humus is found. Some muriatic acid, diluted with five times its weight of water, is added to the deposit left after pouring off the water containing the humus and soluble matter: the whole is agitated, and more acid added gradually, as long as effervescence takes place, and until the mixture remains decidedly acid, which indicates that all the calcareous earth is dissolved. Should there be a great proportion of this, the whole may be boiled, adding muriatic acid gradually, till all effervescence ceases; what remains, after washing it well, is siliceous and argillaceous earth. These are separated by agitation, allowing the siliceous part to settle, which it does in a few seconds. The alumina is poured off with the water, filtrated, heated over the lamp, and weighed,—the same with the siliceous sand. The loss of weight is calcareous earth. In this manner, but with greater care and more accurate tests, various soils of known fertility have been analyzed, of which we will give a few examples.

A very rich soil near Drayton, Middlesex, examined by Davy, consisted of $\frac{2}{3}$ of siliceous sand and $\frac{1}{3}$ of impalpable powder, which, analyzed, was found to be composed of

	Parts.
Carbonate of lime	28
Siliceous earth	32
Alumina	29
Animal and vegetable matter	11
	100

This is a rich sandy loam, probably long and highly-manured, fit for any kind of produce, and, if deep, admirably fitted for fruit trees.

Another good turnip soil, by the same, consisted of 8 parts of coarse siliceous sand, and 1 of fine earth, which being analyzed, consisted of

	Parts.
Carbonate of lime	63
Silica	15
Alumina	11
Oxide of iron	3
Vegetable and saline matter	5
Water	3
	100

This is a very light sandy soil, and owes its fertility to the fine division of the carbonate of lime and the vegetable and saline matter. It may probably have been limed or marled at some time or other.

The best loam in France, according to Mr. Tillet, consists of

	Parts.
Fine siliceous sand	21
Coarse ditto	25
Carbonate of lime	37.5
Alumina	16.5
	100

A loam at Chamart, highly prized by gardeners about Paris, as the basis of their artificial soils, consists of

	Parts.
Argillaceous sand	57
Finely divided clay	33
Siliceous sand	7.4
Carbonate of lime, coarse	1
Ditto, fine6
Woody fibre5
Humus and soluble matter5
	100

The argillaceous sand is composed of fragments of soft stone, which retain moisture, and do not bind hard; the small proportion of humus is of no consequence where manure is to be had in any quantity.

A very rich heath or bog-earth found at Meudon, and in great request for flowers and in composts, consists of

	Parts.
Gritty siliceous sand	62
Vegetable fibres partly decomposed	20
Humus	16
Carbonate of lime8
Soluble matter	1.2
	100

This soil, like our bog earth, would be very unfit for the growth of corn; but, from the quantity of humus and vegetable matter, is highly useful in composts and artificial soils: mixed with lime, it would make an excellent top-dressing for moist clay soils.

Mr. Thaer has given a classification of soils of known qualities, which, we think, worthy of notice. It is as follows:—

No.		Clay, p. cent.	Sand, p. cent.	Carb. of Lime, p. cent.	Humus, p. cent.	Value.
1	First class of strong wheat soils . . .	74	10	4½	11½	100
2		81	6	4	8½	98
3		79	10	4	6½	96
4		40	22	36	4	90
5	Rich light sand in natural grass . . .	14	49	10	27	?
6	Rich barley land . .	20	67	3	10	78
7	Good wheat land . .	58	36	2	4	77
8	Wheat land . . .	56	30	12	2	75
9	Ditto	60	38	12	2	70
10	Ditto	48	50	2	2	65
11	Ditto	68	30	2	2	60
12	Good barley land . .	38	60	2	2	60
13	Ditto second quality .	33	65	2	2	50
14	Ditto	28	70	2	2	40
15	Oak land	21½	75	1½	1½	30
16	Ditto	18½	80	Very insignificant quantities.	1½	20

Below this are very poor rye-lands.

In all these soils the depth is supposed the same, and the quality uniform to the depth of at least six inches; the subsoil sound, and neither too wet nor too dry.

Nos. 1, 2, and 3, are alluvial soils, and from the division and the intimate union of the humus, are not so heavy and stiff as the quantity of clay would indicate.

No. 1 is a rich clay loam, such as is found in many parts of England, neither too heavy nor too loose, —a soil easily kept in heart by judicious cultivation.

No. 5 is very light and rich, and best adapted for gardens and orchards, but not for corn; hence its comparative value can scarcely be given.

Nos. 6, 7, 8, are good soils; the quantity of carbonate of lime in No. 8 compensates for the smaller portion of humus. This land requires manure, as well as the others below. In those from No. 9, downwards, lime or marl would be the greatest improvement. Nos. 15 and 16 are poor light soils, requiring clay and much manure. But even these lands will repay the cost of judicious cultivation, and rise in value.

The last column, of comparative value, is the result of several years' careful valuation of the returns, after labour and seed had been deducted.

Few soils in England contain more than 4 or 5 per cent. of humus, even when in very good heart; and 2 per cent., with a good loamy texture, will render a soil fit for corn with judicious cultivation. The texture is of most importance, as may be seen by comparing Nos. 7 and 8 with No. 6. If this is of good quality, dung will soon give the proper supply of humus.

The depth of the soil and the nature of the subsoil greatly

affect its value. However rich it may be, if there is only a thin layer of good soil over a sharp gravel or a wet clay, it can never be very productive: in the first case, it will be parched in dry weather; and in the latter, converted into mud by every continued rain. If the subsoil be loam or chalk, six inches of good soil will be sufficient. With a foot of good soil, the subsoil is of little consequence, provided it be dry, and the water can find a ready outlet. The best alluvial soils are generally deep, the chalky shallow.

The exposure, with respect to the sun, and the declivity of the ground, are very important circumstances, and equivalent to an actual difference in the climate. A gentle declivity towards the south, and a shelter against cold winds, may make as great a difference as several degrees of latitude; and in comparing the value of similar lands in different climates, the average heat and moisture in each must be accurately known. A soil very fertile in the south of Europe may be very unproductive in England; and a light soil of some value in the west of Scotland might be absolutely barren in Italy or Spain.

Of the Cultivation of the Soil.—The better the soil, the less cultivation it requires to produce tolerable crops; hence, where the land is very rich, we find in general a slovenly culture; where the ground is less productive, more labour and skill are applied to compensate for the want of natural fertility. The simplest cultivation is that of the spade, the hoe, and the rake, —and on a small scale it is the best; but spade husbandry cannot be carried to a great extent without employing more hands than can be spared from other occupations. The plough, drawn by oxen or horses, is the chief instrument of tillage, and has been so in all ages and nations of which we have any records. Its general form is familiar to every one, and requires no minute description. The various kinds of ploughs in use at different times, and the improvements which have been made, and are attempted daily, will be noticed in a separate article [see *Plough*]. Suffice it to say, at present, that a plough should as much as possible imitate the work done with a spade. It should cut a slice from the land by its coulter (*a*) vertically, and by the share (*b*), horizontally lift it up, and turn it quite over by means of the mould-board (*c*); and the art of the ploughman consists in doing this perfectly, and with such a depth and width as suit the soil and the intended purpose. In rich mellow soils a ploughed field should differ little from a garden dug with the spade. In tenacious soils, the slice will be continued without breaking, especially if bound by the fibres and roots of plants: the whole surface will be turned over, and the roots exposed to the air: it is of great consequence that each slice be of the same width and thickness, and the sides of it perfectly straight and parallel. The plane of the coulter must be perfectly vertical, and that of the share horizontal, in order that the bottom of the furrow may be level, without hollows or *banks*, which are irregularities produced by the rising or sinking of the plough, or inclining it to either side. The ancients were very particular in this respect, and recommended sounding the earth with a sharp stake, to ascertain whether the ploughman had

[Plenty's Swing Plough.]

a, The coulter.
b, The point of the share.
c, The mould-board.
d, The beam.

e, The chain by which it is drawn; g, a long iron link to which the chain is fixed, which can be hooked in any of the notches f, altering the line of draught.
h h, The handles, or stils.
i, The hook to draw by.

[Plenty's Improved Flemish Plough, with one wheel and skim coulter.]

This plough differs from the common swing plough, in having a small wheel (b) by which the depth of the furrow is more easily regulated,—and a skim coulter (c), which pares off the grass and weeds and turns them into the bottom of the furrow; it is also broader at the point. It is suited to light friable soils.

done his duty. There are various modes of ploughing land, either quite flat, or in *lands* or *stitches*, as they are called in England, and, in Scotland, *rigges*, that is, in portions of greater or less width, with a double furrow between them—somewhat like beds in a garden. Sometimes two ridges are set up against each other, which is called *ridging* or *bouting*; the land then is entirely laid in high ridges and deep furrows, by which it is more exposed to the influence of the atmosphere and kept drier; this is generally done before winter, especially in stiff wet soils. Sometimes two or more ridges are made on each side, forming narrow stitches. When the ground is to be ploughed without being laid in lands or stitches, and all the ridges inclined one way, the mould-board of the plough is shifted at each turn from one side to the other. The plough which admits of this is called

a *turn wrest plough*, and is in general use in Kent, and in many parts of the continent, where the subsoil is dry and the land not too moist. In most other situations the ground is laid in *lands*, and the mould-board of the plough is fixed on the right side. When grass land or stubble is ploughed, care must be taken to bury the grass and weeds completely, and the slice cut off by the plough must be turned over entirely, which is best done by making the width of the furrow greater than the depth. When the grass and weeds are rotten, and the ground is ploughed to pulverize it, a narrow deep furrow is best; the earth ploughed up is laid against the side of the preceding ridge, which forms a small furrow between the tops of the ridges, well adapted for the seed to lodge in and to be readily covered with the harrows.

[Plenty's Common Rhomboidal Harrow.]

Nothing has divided both practical and theoretical agriculturists more than the question whether the land should be ploughed deep or shallow; but a very slight attention to the purposes for which land is ploughed, and to the nature of the soil, will readily reconcile these apparently contradictory opinions. A deep, rich, and stiff soil can never be moved too much nor too deep: deep ploughing brings up rich earth, admits the air and water readily, and gives room for the roots to shoot, whilst the rich compact soil affords moisture and nourishment. Wherever trees are to be planted, the ground should be stirred as deep as possible, even in a poor soil: for grass and corn, this is not always prudent; their roots seldom go above three or four inches deep, and if they find sufficient moisture and humus, they require little more depth.

Whenever the soil below a certain depth is of an inferior quality, there can be no use in bringing it up; and where the soil is light and porous, the bottom had much better not be broken. Norfolk farmers know this well, and are very careful not to break the *pan*, as they call it, in their light lands: this *pan* is formed by the pressure of the sole of the plough and the tread of the horses, and opposes a useful bank to the too rapid filtration of the water;

it lies from five to eight inches below the surface. If it is broken, the manure is washed down into the light subsoil, and the crop suffers, especially when sheep have been folded, their dung being very soluble. In such soils an artificial pan may be formed by the *land-presser* or *press-drill*. This instrument consists of two very heavy cast-iron wheels, *a a*, with angular edges, set on an axle, at a distance from each other equal to the width of the furrows, and a lighter wheel, *b*, to keep the instrument vertical.

It is drawn by a horse immediately after the plough, pressing two furrows at once, and going twice over each furrow. It leaves the land in regular drills, and the seed sown by hand falls into the bottom of the drills, and is covered by the harrows. When the plants come up they appear in regular parallel rows.

The great object in ploughing land is to divide it, expose every part of it to the influence of the elements, and destroy every plant or weed but those which are sown in it. To do this perfectly requires several ploughings, with certain intervals, and during that time no crop can be upon the land. This is the real use of fallows, and not, as was once supposed, to allow the land to rest; on the contrary, it ought then to have the least repose.
